### Safety technique

- Safety switching devices
- Standstill / speed monitoring
- Multifunctional safety devices
- Wireless Safety System
- Safety switches
- Guard locks
- Key transfer

### Monitoring technique

- Residual current monitors
- Insulation monitors
- Insulation fault location system
- Measuring and monitoring relays
- Fault annunciators and fault annunciation systems
- SMS-Telecontrol module

### Power electronics

- Solid-state relays / contactors
- Reversing contactors
- Softstarters
- Motor brake relays
- Speed and phase controllers
- Multifunctional motor control units

### Control technique

- Latching / interface / switching relays
- Interface modules
- Power supply units
- I / O modules
- CANopen PLC
- CANopen I / O modules

### Time control technique

- Multifunction relays
- Flasher relays
- Cyclic timers
- Fleeting action relays
- Pulse extender
- Star delta timers
- Timers
  - on delayed
  - off delayed

### Installation technique

- Time switches
- Remote switches
- Specific installation electronics

- Machinery and plant
- Power generation/distribution
- Oil and gas industry
- Automation
- Transport and material handling systems
- Rail technology
- Aviation/marine industry
- Paper and printing industry
- Food industry
- Rubber/plastics industry
- Heating and refrigeration
- Automotive
- Mining/metal working
- Chemical/pharmaceutical applications
- Medical technology
- Water/waste water treatment
- Cable cars/ski lifts

... and wherever safety has high priority.  
We can cover your industrial applications as well!

# DOLD – Solutions for you

The DOLD philosophy, "Our experience. Your safety" constitutes our program: Offering solutions based on over 80 years of experience with a workforce of more than 400 employees, we manufacture high quality products using state-of-the-art production plant at our Furtwangen facility in Germany.

The comprehensive product range includes relay modules, safety relays with positively-driven contacts and electronic housings with virtually unparalleled production detail.

The combination of know-how, innovation and experience makes us one of the leading worldwide manufacturers.

Apart from standard solutions, we are also the right partner when individual industrial solutions with that special touch are required.

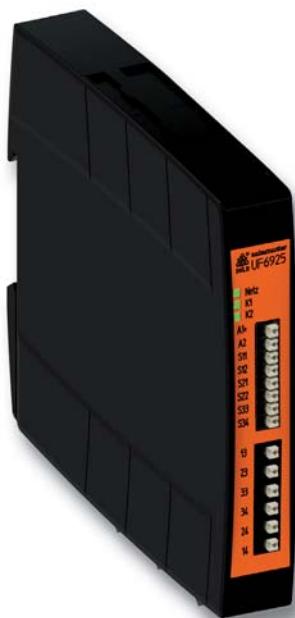

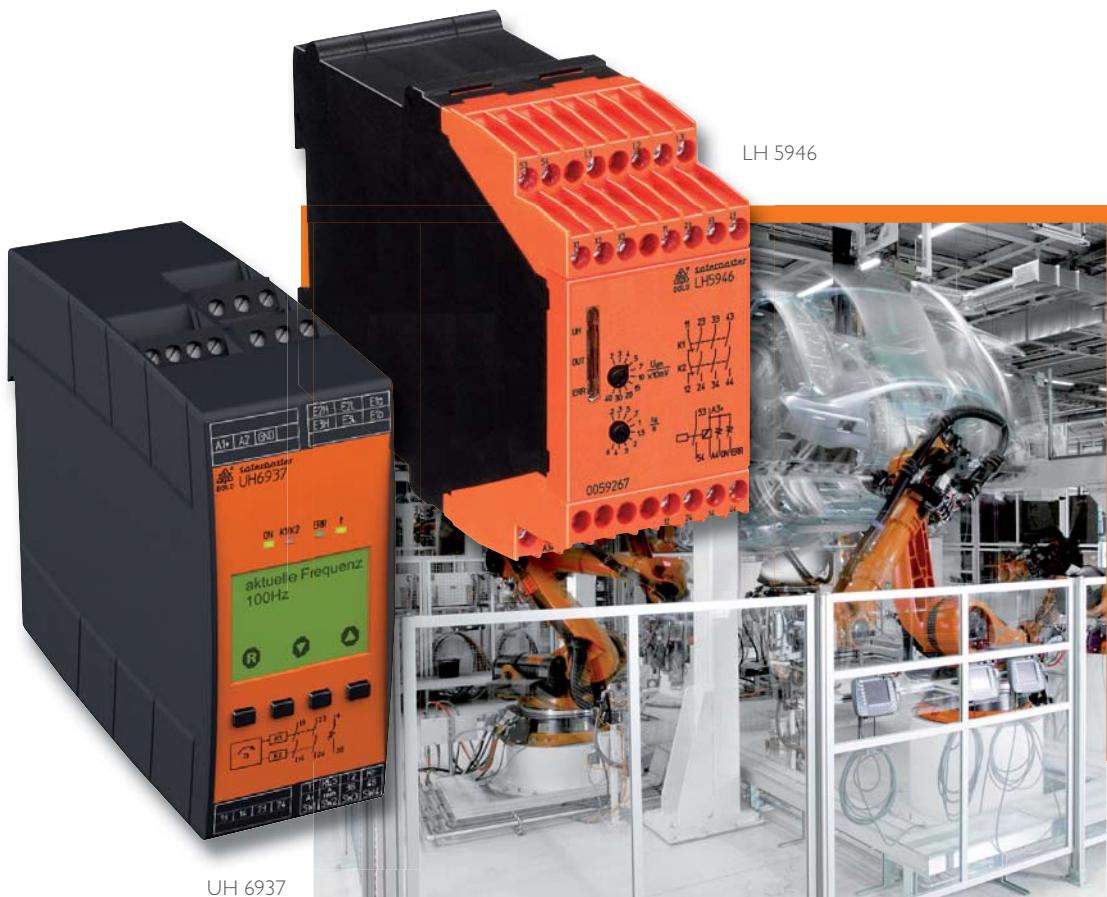

Staying in close contact with our customers is very important to us. We listen, analyze and act by offering flexible, custom high-tech solutions, from a single source.

Thanks to our own development laboratory, highly automated production facilities with a modern tool & die shop in addition to injection moulding facility together with a well organized sales and marketing department, we guarantee high quality and short delivery times. Your benefits: Increased plant and machine availability, planning reliability and low production costs.

# SAFEMASTER S

## – Safe drive monitoring

The new speed monitors of the SAFEMASTER S series recognize and signal downtimes and machine and system speeds in both automatic and set-up modes. With these devices, DOLD is offering efficient, economical solutions for safe monitoring drives without sensors and for monitoring speed using initiators.

# SAFEMASTER

## – Safety relay modules from 17.5 mm

The only 17.5 mm wide emergency stop module monitors safety functions such as emergency stop or safety door safely and simply in nearly every application and is characterised by maximum safety for man and machine with minimum space requirement. It allows time-saving wiring through the integrated front-side Push-In cage clamp terminals.

The modular and configurable safety system SAFEMASTER PRO monitors all safety circuits of your machines and installations – in a simple, flexible and safe manner.

## Functional Safety Solutions

Safety relay modules of the SAFEMASTER family monitor a variety of safety functions such as emergency-stop, two-hand controls, safety mats, and light barriers. From monofunctional safety switching devices to multifunctional modular safety system with field bus connection, all products serve a single purpose: the uncompromising protection of people and machinery. Manufacturers and operators of

machines and systems are faced with the challenge of developing and/or operating safety-oriented switching devices that must meet numerous regulations. DOLD supports its customers with type-tested safety relay devices for safety applications up to Cat. 4 / PL e and SIL 3, with which you can implement solutions optimized for functionality and cost.

UH 6900

The radio controlled safety module of the SAFEMASTER W series for the safety-oriented transmission of e-stop and control functions offers more flexibility in the protection of hazardous areas. By implementing the latest radio controlled technologies, a high degree of availability and safety is achieved. Safety zones can be connected wirelessly to each other over a considerable distance.

**SAFEMASTER W**  
– Radio controlled safety system

SAFEMASTER STS combines the advantages of safety switches, guard locks, key transfer and command functions in a single system. The new fibre reinforced polymer (FRP) variant will convince you by its ambitious design and it offers the possibility to be combined with the established stainless steel components. You can easily select

the FRP variant for the control panel while you prefer using the very robust stainless steel version in rough environmental conditions.

## SAFEMASTER STS – Modular safety switch and key transfer system

SAFEMASTER STS is tested and approved according to statutory requirements, and as an individual system is suitable for use in safety applications up to Cat. 4 / PL e in accordance with EN ISO 13849-1.

# Safety technique

## 1. Preface

It is the aim of every business to improve the operational return by increasing productivity. Among others, this is achieved by evermore automation on work places and shortening of cycle times. Accident research has proved that this increases the risk potential on work places, which finally led to an increased safety awareness and found expression in national and international standards.

Besides the human aspect, safety-improving measures can also be justified from the business point of view. Assuming that there is no absolute safety also in technology there will always remain non-excludable residual risks. The diagram below illustrates the relationship between safety improvement and risk financing costs. It can be seen from the business aspect that the residual risk is determined by the minimum of total costs

after safety-improving measures.

**Fig. 1**

Financing costs of a risk after implementation of safety-improving measures as a function of the desired extent of safety. Source: Eberhard Franck, Risikobewertung in der Technik, Labor 2000-1991

On the basis of accident research results, standards and regulations require a minimum extent of safety. An ultimate decision on what residual risk can be allowed always requires a risk assessment with an evaluation of the danger potential and depends on the type and severity of damages as well as the probability of occurrence. If the minimum requirements cannot be met, required measures have to be defined together with industry-specific authorities for health and safety at work such as employers' liability insurance associations or TÜV. Within the scope of product liability (see also the law for safety of equipment and products - GPSG), the German Federal Supreme Court has considerably extended the scope of liability for consequential damages of faulty products. In future, this scope of liability cannot be limited by a contractually restricted warranty in the general terms of delivery. Moreover, the conformity with the requirements of the European Directive on Machinery is a prerequisite for the distribution of machinery on the European market. This directive requires a high safety standard.

For manufacturers and users of machinery and plants, it is not always easy to implement circuitry that meets the abundance of regulations. To support users in implementing safety-related circuits DOLD offers switching devices that allow modular solutions tailored to the relevant application with respect to functionality and costs.

These include:

- Emergency stop circuits
- Safety gate monitors
- Safety switch and key transfer systems
- Two-hand circuits

- Evaluators for safety switches
- Speed/zero-speed monitors
- Coupling modules
- Light grid modules
- Light barrier and evaluator modules
- Multi-functional safety modules and modular safety systems
- Valve monitoring modules
- Delay modules
- Motor braking units

These modules wired ready for connection comply with applicable national and international standards and regulations and are tested by authorities responsible for their enforcement if required. DOLD considers new standards coming into force already during the preliminary stages.

## 2. Standards and directives

The implementation of the European Union's domestic market requires a further cutback of technical trade barriers by standardization of approval requirements.

To this end, the Council of the European Union has enacted the European Directive on Machinery 98/37/EC, in which the occupational safety is given a high priority. To account for latest developments and technical progress the new Directive on Machinery 2006/42/EC came into force on 29.12.2009.

However, the Directive on Machinery only defines global safety standards. How to realize the safety requirements in detail is recommended in standards that have been worked out on the basis of international standards, e.g. by the European Committee for Electrotechnical Standardization (CENELEC). New successor standards substantiate the increasing requirements with respect to complexity and especially quality. Products from DOLD have always met the most stringent requirements.

### 2.1 The most important standards

#### Directive on Machinery 98/37/EC; from 29.12.2009: 2006/42/EC

- **Type A: Basic safety standards**
  - DIN EN ISO 12100 "Safety of machinery"
  - (former DIN EN 292)
  - DIN EN ISO 14121 "Principles of risk assessment"
  - (former DIN EN 1050)
- **Type B: Safety group standards**
  - DIN EN 60204-1 "Electrical equipment of machinery"
  - DIN EN ISO 13857 "Safety of machinery - Safety distances to prevent hazard zones being reached by upper and lower limbs (former DIN EN 294 and DIN EN 811)"
- **Type B1: General overriding safety aspects**
  - DIN EN ISO 13849 "Safety-related parts of control systems"
  - (former DIN EN 954-1)
  - DIN EN 62061 "Safety of machinery - Functional safety of safety-related electrical, electronic and programmable electronic control systems"
  - DIN EN ISO 13850 "Emergency stop - Principles of design"
  - (former DIN EN 418)
- **Type B2: Specifications of protection devices**
  - DIN EN 574 "Two-hand control devices" (see also ISO 13851)
  - DIN EN 61496 "Electro-sensitive protective equipment (ESPE)"
  - DIN EN 1088 "Interlocking devices associated with guards"
- **Type C: Specific safety requirements for specific machine types**
  - DIN EN 692 "Mechanical brakes"
  - DIN EN 693 "Hydraulic presses"
  - DIN EN 201 "Injection moulding machines"
  - DIN EN 12415 "Small numerically controlled turning machines and turning centres"
  - DIN EN 12417 "Machining centres"
  - DIN EN 13218 "Stationary grinding machines"
  - DIN EN 12478 "Large numerically controlled turning machines and turning centres"

# Safety technique

## 2.2 New standards

### DIN EN 61508

Functional safety of electrical/electronic/programmable electronic safety-related systems

The standard DIN EN 61508 considers safety-related functions over the whole life cycle of a product/system from design to decommissioning (probabilistic aspects).

It is a basic safety standard from which industry-specific or sector-specific standards are derived, including DIN EN 61511 for process industry, DIN EN 61513 for nuclear power plants or DIN EN 62061 for the mechanical engineering industry.

### DIN EN 62061

Safety of machinery

Functional safety of safety-related electrical, electronic and programmable electrical control systems

Application-specific sector standard for the mechanical engineering industry.

The requirements on safety-related performance in the DIN EN 61508 relevant for the safety of machinery field are substantiated in the DIN EN 62061 with respect to significant hazards on machinery.

### DIN EN ISO 13849

Safety of machinery - Safety-related parts of control systems

Part 1: General principles of design

Part 2: Validation

Revised EN 954-1 that extends the deterministic perspective of EN 954-1 by probabilistic aspects as can be found in DIN EN 61508, i.e. the safety-related performance is considered over the whole life cycle of a product/system from design to decommissioning.

In this standard, the deterministic (safety) categories are further included, but are evaluated by additional weighting by characteristic values such as MTTFd (Mean time to dangerous failure), DC (Diagnostic coverage) and CCF (Common Cause Failure) and result in a so called PL (Performance Level).

The Performance Level (PL) defines the range of probability of a dangerous failure per hour (probabilistic; so called PFH<sub>d</sub>), which is the bridge to the SIL classifications of the DIN EN 62061.

In short, a safety function is assessed in its existing category and additionally by its quality (EN 954-1 → EN ISO 13849-1) or generally by its quality (EN 62061). If the outcome corresponds to the class required by the risk assessment, the required safety-related performance will be reached. It becomes clear that an existing category of the EN 951 can no longer be simply mapped in a Performance Level. The required safety-related performance of the relevant safety function is still determined and defined from the defined risks of an application. (Risk graph → PL, Performance Level required in DIN EN ISO 13849, SIL class DIN EN 62061).

Both the DIN EN ISO 13849 and also the DIN EN 62061 are equally applicable to electrical systems. The DIN EN ISO 13849 additionally covers mechanical, hydraulical and pneumatic systems. The EN 954-1 is only allowed to be used alternatively to the DIN EN ISO 13849 until November 2009.

## 2.3 Scope

The scope of the European Directive on Machinery 98/37/EC (2006/42/Ec from 29.12.2009) is not only restricted to industrial machines, as was the case to date, but covers almost all machines for use in the fields

- Industry
- Trade
- Private industry

Machines in terms of this directive include:

- Single machines
- Complex plants (interlinked machines)
- Interchangeable equipment for changing the functionality of a machine
- Equipment with drive system and movable devices
- Mobile machinery (e.g. industrial trucks)
- Machinery for lifting loads (cranes, lifting devices)
- Machinery for lifting or transporting persons (e.g. mobile working platforms)
- etc.

Following equipment is excluded:

- Machinery and facilities that are covered by other European Directives
- Military equipment
- etc.

## 3. Definitions according to ZVEI TA SI

### Switching off in an emergency

→ Shutting down in an emergency

### Actuator

Actuator, e.g. motor, valve, relay, motor contactors, etc.

### Requirement class

According to DIN 19250, assignment of requirements for the implementation of a safety device with the aim to achieve a safety-related performance of the device that is adequate for the risk. It is mainly the product from the extent of damage and the probability of occurrence.

### Restart inhibit

Device that prevents an automatic machine start if the power supply of the → safety-related evaluation device is applied or interrupted and restored.

### Test when starting

Manual or automatic test of the → safety-related evaluation unit after the supply voltage has been applied to it. A manual opening and closing of guard after application of the supply voltage is one example.

### Test when starting, safety-related

#### Single-channel control:

Control via one signal transmitter output

#### Two-channel control:

Control via two signal transmitter outputs

#### Output expansion module

→ safety-related evaluation unit that can only be used in connection with a → basic device for purpose of output multiplication.

### Switching off in emergency

Action in emergency for purpose of cutting off the supply with electric energy for the whole installation or a part of it if there is a risk of electric shock or another risk of electrical origin.  
[DIN EN 60204-1:2006 Annex E].

The objective of it is to prevent or reduce upcoming or existing risks for persons and damages to machinery, products or environment.

### Evaluation unit, safety-related

Generates a safety-related output signal as a function of the state of connected signal transmitters either according to a fixed assignment or according to programmed instructions. → safety-related evaluation unit

#### B<sub>10d</sub>

Number of cycles until 10 % of the components have dangerously failed (for pneumatic and electromechanical components).

[DIN EN ISO 13849-1]

#### Basic device

of an evaluation unit that includes all basic functions which are required in safety systems as a minimum to generate a safety-related output signal.  
→ expansion unit

#### Command device

→ Signal transmitter

#### BWP

Contactless position switch → PDF

#### BWS

Electro-sensitive protective equipment (ESPE)

Mainly a sensor function and the associated control/monitoring function with output switching element (→ OSSD) [IEC / DIN EN 61496]

# Safety technique

## CCF

### Common Cause Failure

Failures of different units due to a single event, with the failures being not due to each other.

## DC

### Diagnostic coverage

Ratio between the failure rate of detected dangerous failures and the failure rate of all dangerous failures

## Discrepancy monitoring

Tolerates the lack of synchronization of related signals over a defined time window.

REMARK 1: Also the term "Simultaneity monitoring" is used.

REMARK 2: The monitoring of signal transmitters is used to increase the functional safety. It is done by checking the signal transmitters's signal change within a specified time.

If this time is exceeded, no enable signal will be output. Such a monitoring is required for some safety systems (→ two-hand operation).

## Diversity

Diverse redundancy

System design with different measures for the same objective to avoid systematic errors.

## Speed monitoring, safety-related

Safety-related monitoring of a defined rotational speed.

NOTE 1: The drive is turned off or an alarm is issued when this speed is overrun or underrun.

## Dynamic testing

→ Testing

## Earth-fault detection

When an earth fault is detected the device goes to the agreed safe state either immediately or in the course of a cyclic self-monitoring.

## Expansion unit

An expansion unit is a

→ safety-related evaluation unite that can only be used in connection with a → basic unit for purpose of contact or input multiplication.

→ Output expansion units are incorporated in the → cyclic self-monitoring.

Distinction:

- **Output expansion unit** for multiplication of safety outputs
- **Input expansion unit** for multiplication of safety inputs

## Fault response time

### First fault occurrence time:

This is the time interval in which the probability that a safety-critical first fault occurs for the requirement class involved is sufficiently low. The time interval starts with the last instant in time at which the system involved was in a state that can be assumed as being fault-free for the requirement class being considered.

NOTE: Fault-controlling measures are not taken into account.

### Occurrence time for multiple faults:

This is the time interval in which the probability that combined safety-critical multiple faults occur is sufficiently low for the requirement class involved. The time interval starts with the last instant in time at which the system involved was in a state that can be assumed as being fault-free for the requirement class being considered.

## Fault tolerance time

Time interval in which the process can receive incorrect control signals without a hazardous state occurring.

## FIT

### Failure in Time

Describes the failure rate of technical components, in particular electronic components. The unit FIT indicates the number of components that fail within  $10^9$  hours. Statistically, components having a high FIT value fail more frequently than those having a lower FIT value. Failure rate at a FIT value  $\lambda = 1/10^9$  h, that means once in approx. 114 000 years.

$\lambda$

Failure rate of a component in → FIT

$\lambda_{\text{total}}$

Failure rate

Failure rate of the device in → FIT.

## FMEDA

### Failure Modes, Effects and Diagnostic Analysis

## Enable circuit

Generates a safety-related output signal.

## NOTE:

To the outside, enable circuits act as NO contact (→ OSSD).

## Function test

Testing of the expected function of a device.

## NOTE:

The function test can either be realized automatically using the control system or manually by monitoring or testing - when operational and at defined time intervals or as a combination depending on the requirement [DIN EN 60204-1, paragraph 9.4.2.4].

## Controlled stopping

→ Stop function

## Simultaneity monitoring

The simultaneity monitoring of signal transmitters by the safety-related evaluation unit is used to increase the functional safety of the protective safety device. The monitoring function is realized by checking the signal change of the signal transmitters within the specified time - the synchronous monitoring time. If this time is exceeded, no enable signal will be output. A simultaneity monitoring is required for several safety devices (→ two-hand circuit).

## Basic device

→ Basic unit

## Category

Classification of safety-related parts of a control system with respect to their resilience against and behaviour during faults (B, 1, 2, 3, and 4) that is reached by the structural arrangement of the parts and/or their reliability. [DIN EN 954-1, see also DIN EN ISO 13849-1].

## Magnetically-operated switch

→ Signal transmitter, PDF

## Occurrence time for multiple faults

→ Fault response time

→ Occurrence time for multiple faults

## Signaling output

→ Signaling circuit

## Signaling circuit

A signaling circuit is used to generate a non safety-related output signal.

## MTTF<sub>d</sub>

Mean Time To Failure dangerous

## Muting

The safety-related function is correctly and deliberately disabled using additional sensors for a limited time (a type of bypass function). [IEC / DIN EN 61496-1].

# Safety technique

NOTE: These sensors are used to make a differentiation between persons and objects.

## Muting sensors

→ Signal transmitter

## Proximity switch

→ Signal transmitter

## Emergency stop

→ Switching off in an emergency

## Emergency stop device

An emergency stop device is an arrangement of components for the realization of the emergency stop function.

(EN 13850/EN 60947-5-5 / EN 60204-1)

## Emergency stop button

→ Signal transmitter

## Emergency stop

→ Shutting down in an emergency

## OSSD

**Output Switching Signal Device [IEC/ DIN EN 61496]** - part of the ESPE (electro-sensitive protective equipment)/PDF that goes into the OFF state if the → safety-related evaluation unit or monitoring devices respond.

## PDF

→ Signal transmitter

## PDS(SR)

Electrically-powered drive system with adjustable speed suited for use in safety-related applications. [DIN EN 61800-5-2]

## Performance Level

Discrete level of safety-related capability.

PL a is the lowest and PL e the highest level [DIN EN ISO 13849].

## Periodical test

The periodical test of electro-sensitive protective equipment type 2 simulates the operation of the sensor part to detect a dangerous failure. It is specified for the function proof of electro-sensitive protective equipment type 2 according to EN 61496-1 and is realized by the → safety-related evaluation unit.

## PFD

Probability of Failure on Demand or mean probability of failure when a safety function is demanded.

## PFH<sub>d</sub>

Probability of Failure dangerous per Hour or probability of dangerous failure per hour.

The failure limit PFD is used for small demand rates, while the failure limit PFH is used for large or continuous demand rates.

## PL

→ Performance Level

## PL<sub>r</sub>

Performance Level required

Applied PL to fulfill the expected risk minimization for each safety function.

## Position switch

→ Signal transmitter

## Proof Test (repeat test)

Repeated test that is executed to detect faults in a safety-related system so that - if necessary - the system can be brought into an "as new state", or as close as is practically possible to this state.

## Cross-circuit fault

A conductive connection / short-circuit between the input channels of an emergency stop module.

NOTE: A cross-circuit can only occur for multi-channel control circuits.

## Cross-circuit fault detection

This is the ability of a → safety-related evaluation unit to detect cross-circuit faults either immediately or as a part of a cyclic monitoring routine - whereby the unit goes into a defined safe condition after the fault has been detected.

## Redundancy

The availability of more devices or systems than necessary for a function.

NOTE: Several functional groups are used for the same function (e.g. multi-channel structure). In particular in safety engineering, this means the duplication of critical components [EN ISO 12100-2].

## Reset

Resetting to a defined condition

→ Start

## Reset button

→ Signal transmitter

## Risk

The combination of probability that damage will occur and the extent of the damage. [EN ISO 12100-1]

NOTE: The severity of the damage, the exposure to a hazard, the probability of occurrence and the lack of fallback procedures are influencing factors [EN ISO 14121].

→ Risk assessment

## Risk assessment

This is the evaluation of safety-related requirements under consideration of the extent of damage, probability of occurrence and risk classification.

NOTE: As a rule, the hazard consequence is the damage extent element of the risk. Either the limit of probability or frequency of occurrence has to be estimated or a permissible limit to be defined for each risk.

The hazard consequence connects the recognized hazards with the risk assessment.

The hazard consequence connects hazards and dangerous events that may cause an accident. Hazard weighting is made by allocation of a → category,

→ requirement class of a → Safety Integrity Level (SIL) or Performance Level (PL).

EN ISO 14121 includes methods required for a risk assessment. According to this, the risk assessment includes at first a risk analysis and a subsequent risk evaluation.

## Feedback circuit

Monitors controlled actuators.

NOTE: The → safety-related evaluation unit can only be activated when the feedback circuit is closed. A safe feedback of relays or contactors, for example, is realized with positively driven contacts. Normally closed contacts are connected in series and integrated in the feedback circuit of the safety-related evaluation device. If a contact welds in the enable circuit, then it will be no longer possible to re-activate the safety-related evaluation unit because the feedback circuit remains open.

## Safety Integrity Level (SIL)

→ Safety Integrity Level

## Safety-related evaluation unit

A safety-related evaluation unit, e.g. safety control, safety module, safety switching device, evaluation unit.

## Pressure sensitive mats, safety switching strips, switching edges

→ Signal transmitter

## Protective door monitors

Monitors the position of position switches on a guard. It generates a safety-related output signal when this protective door is closed.

## Cable-operated switch

→ Signal transmitter

## Self-monitoring

The correct functioning of a component is automatically and cyclically monitored.

→ Testing

# Safety technique

## SFF

Safe Failure Fraction

Portion of harmless failures

## Safely reduced speed

Safety monitoring of the speed of drives

NOTE:

The function allows an axis or spindle to be monitored for a specified speed. When setting-up, e.g. the speed limits should be applied corresponding to the valid C Standard, e.g. 2 m/min for axes. In many machines, the safely monitored speed is also used during automatic processing and machining. In order to prevent damage to the machine or to the production materials, it is possible to safely prevent maximum rotational speeds and velocities from being exceeded.

The drive manufacturer must provide appropriate protective measures that allow only the machine manufacturer to change the speed limit values. Further, whenever the speed/velocity limit values are re-set or modified, an acceptance test must be carried out. During this acceptance test, the commissioning engineer must accelerate the drive up to the speed/velocity limit value and document the perfect safety-related response on a form provided by the drive manufacturer.

## Safe operating stop

The drive is kept at standstill which is monitored by its control system.

NOTE 1:

The higher-level → safety-related evaluation unit initiates the safety-related response when the drive moves away from the standstill position.

NOTE 2:

The safe operating stop function is always used where frequent interventions in the process are required and an isolation from the power supply by hardware is not practicable. Application examples include setting-up operation and running-in CNC programs.

## Safe standstill (safe torque off)

Safe interruption of the energy supply to the drive so that no torque can be generated and thus no dangerous movement occurs.

NOTE:

It is not necessary to monitor the standstill state. The energy supply can be disconnected using contacts, but this is not compulsory.

## Safe stopping process

Stopping of the drive corresponding to the hazardous situation (stop function).

NOTE:

Electrical, electronic and electromechanical equipment that is required to decelerate the drive must be incorporated in the safety considerations.

Measures include:

- Controlled stopping with safely monitored deceleration time / standstill
- Controlled stopping with safely monitored braking ramp
- Uncontrolled stopping using mechanical brakes

## Protective device

Technical means used to prevent hazards/damages for man, production materials and environment.

## Safety combination

→ Evaluation unit, safety-related

## Safety Integrity Level (SIL)

Level used to define the requirements for the safety integrity of the safety functions. SIL 3 is the highest level, SIL 1 the lowest = target for the probability of failure for the design of the risk-reduced function [DIN EN 62061].

## Light grid

→ Light curtain

## Light barrier

→ Signal transmitter

## Light curtain

→ Signal transmitter

## Relay combination

→ Evaluation unit, safety-related

## Safety switching device

→ Evaluation unit, safety-related

## Signal transmitter

- **Magnetically-operated switch**, consisting of one or more reed contacts the switching state of which changes under the influence of a magnetic field.

- **Muting sensor** is used for muting operation (→ Muting) to detect objects for which an → ESPE should not shut down.

- **Proximity switches** (inductive, optical or capacitive) change their switching state when objects or liquids approach. They are mainly equipped with semiconductor (solid-state) outputs.

- **Emergency stop command devices** for actuation in hazardous situations to cause a stop of a process, machine or plant. These devices must have positively-opening contacts, should be easily accessible and tamper-proof [DIN EN 13850; DIN EN 60204].

- **Position switch** is part of the interlocking device of a guard. It changes its switching state as a function of a mechanically issued control command. There are position switches without and with mechanism (→ locking mechanism).

- **PDF (Proximity Devices with defined behaviour under Fault conditions)** are proximity switches for safety functions. Changing optical, magnetic, electrostatic, acoustic or other fields cause a switching operation. The switching signal can be used for safety-related machine controls.

- **NOTE:** Proximity switches for safety functions include a sensor unit (active part), an evaluation device including safety outputs and an actuator (defined object).

- **Reset button** in a → safety-related evaluation unit is a → Restart inhibit which can only be removed by an actuation.

- **Laser scanner** - These are optical area scanners working contactlessly by periodically transmitting pulses of light. An integrated rotating mirror deflects these light pulses into the working zone. Objects that enter the defined protective zone reflect the light pulses - which means that they are detected. The coordinates of the "obstructions" are calculated from the light propagation time. If the "obstruction" is located in a defined protective zone, a stop function will be initiated via safety-related outputs (→ OSSD).

- **Pressure sensitive mats, safety switching plates, strips, edges** change their switching state when they are stepped on (pressure sensitive mat) or deformed (safety switching strips or edges) [EN 1760-1/-2].

- **Cable-operated switches** cause a stop category 0 when the pull cable is pulled or the cable breaks.

- **Safety light grids or light curtains** change their switching state when one or more light beams are interrupted.

- **Safety light barriers (SL)** change their switching state when their light beam is interrupted.

- **Enabling switches** must be manually operated to remove the protective function of protective equipment. It can not initiate hazardous conditions alone. For this, a "second deliberate" command is necessary.

## SIL (Safety Integrity Level)

→ Safety Integrity Level (SIL)

## SIL CL

→ SIL claim limit;

Max. SIL for a subsystem [DIN EN 62061]

# Safety technique

## SLS

### Safely-limited speed

The SLS function prevents that a motor exceeds a defined speed limit. [DIN EN 61800-5-2]

## SOS

### Safe operating Stop

The SOS function prevents the motor from deviating from the stop position by more than a defined value. The → PDS(SR) provides the energy for the motor that enables it to withstand external forces. [DIN EN 61800-5-2]

## SSM

### Safe speed monitor

The SSM function provides a safety output signal to indicate whether the motor speed is below a defined limit value. [DIN EN 61800-5-2]

## Start

### • Automatic start:

An enable signal is generated without manual enabling after a check of the input replica and positive test by the → safety-related evaluation unit.

#### NOTE:

This function is also referred to as dynamic operation and is not allowed for emergency stop equipment.

### • Manual start:

An enable signal is generated by operating the → Reset button and after a test of the input replica and successful testing by the → safety-related evaluation unit.

#### NOTE:

This function is also referred to as static operation and is required for emergency stop equipment (→ Stop function) [IEC / DIN EN 60204-1].

## Position monitoring

Monitoring of a guard (e.g. protective door) using a suited → Signal transmitter and → evaluation unit.

## Stopping in an emergency

This is an operation in an emergency used to stop a process or movement that became hazardous [DIN EN 60204-1:2006 Annex E].

## Standstill monitoring

→ Speed monitoring

## STO

### Safe Torque Off

No energy that could cause a rotation (or movement for a linear motor) is supplied to the motor. The → PDS(SR) does not provide energy to the motor that could cause a torque (or force in case of a linear motor). [DIN EN 61800-5-2]

## Stop function

[EN 60204-1]

### • Stop category 0

Uncontrolled stopping by immediately disconnecting the energy feed to machine drive elements

### • Stop category 1

Controlled stopping where the energy feed is only interrupted once the standstill has been reached.

### • Stop category 2

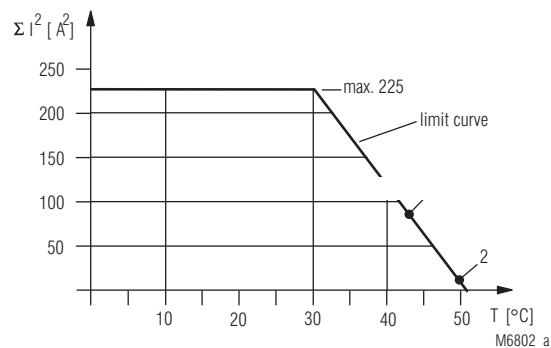

Controlled stopping where the energy feed is still maintained even at standstill

## STS

Key Transfer System (see system overview SAFEMASTER® STS)

## Quadratic total current limit curve

The squared current value must be used to calculate a linear limit curve.

## General formula for determination of the max. environmental temperature

- A) Sum of currents<sup>2</sup> for each safety contact = value on the scale  $\Sigma I^2 (A^2)$
- B) Max. environmental temperature T = intersection of the scale value  $\Sigma I^2 (A^2)$  with the limit curve

### Example 1

- A)  $(4A)^2 + (4A)^2 + (4A)^2 + (4A)^2 + (4A)^2 = 96 A^2$  (scale  $\Sigma I^2$ )
- B) Max. environmental temperature T = 43 °C (point 1)

### Example 2

- A)  $(0.5 A)^2 + (1 A)^2 + (2 A)^2 + (1 A)^2 = 6.25 A^2$  (scale  $\Sigma I^2$ )
- B) Max. environmental temperature T = 49 °C (point 2)

### Note:

The squared total current can be still 1.5 A<sup>2</sup> at 50 °C, i.e. 0.5 A for each safety contact.

- A)  $(0.5 A)^2 + (0.5 A)^2 + (0.5 A)^2 + (0.5 A)^2 + (0.5 A)^2 = 1.5 A^2$
- B) Max. environmental temperature = 50 °C

## Synchronous monitoring time

This is the time during which a simultaneous actuation must occur in order to generate an output signal.

- Discrepancy time monitoring
- Two-hand circuit

## T<sub>1</sub> (Proof Test Interval)

Interval of repeat test

## Pushbutton monitoring

The function of the pushbutton is monitored by a dynamic signal change when the pushbutton is released.

NOTE: By this, a system is prevented from being powered up by a short-circuited pushbutton (e.g. by manipulation or tampering), for example.

## Testing

- Periodical test
- Cyclic test

## Guard

Mechanical separation between a dangerous area and the environment

#### NOTE:

The separation can be designed as protective grid, protective door, enclosure, cover, fence, shield, etc. It can be autonomous or a part of the machine.

## Uncontrolled stopping

→ Stop function

## Interlocking equipment

This is a mechanical, electrical or another device the purpose of which is to prevent the operation of a machine component under certain conditions (usually as long as a guard is not closed). [DIN EN 1088] (see system overview of safety switches and key transfer system SAFEMASTER® STS)

# Safety technique

## Restart inhibit

The restart inhibit prevents a → safety-related evaluation unit from issuing an enable signal after a shutdown, change of machine operating mode or change of the actuation type.

NOTE:

The restart inhibit is only removed by an external command (e.g. → Reset pushbutton).

## Locking

→ Locking mechanism

## Locking mechanism

The purpose of a locking mechanism is to maintain a → guard in its closed position. It is also connected to the control so that the machine cannot start if the guard is not closed and locked and the guard is kept closed until the risk of injury is no longer present. [DIN EN 1088]

(see system overview of SAFEMASTER® STS key transfer system)

## Consent switch

→ Signal transmitter

## Positively driven contacts

Positively driven means for contacts that no NC contact may close if any NO contact does not open. Also, no NO contact may close when an NC contact does not open. This applies to relays/contactors over the complete life cycle and also to a faulty state [DIN EN 50205].

Example: If an NO contact is welded, all the other NC contacts of the relay/contactor concerned remain open no matter whether the relay/contactor is energized or not.

## Positively opening

Contact opening as a direct result of a defined motion of a switch's operating element using non-sprung parts. [DIN EN 60204-1]

NOTE 1:

For the electrical equipment of machinery, the positively opening of NC contacts is expressly required for all safety circuits.

NOTE 2:

According to DIN EN 60947-5-1-k, positively opening is designated by the symbol (arrow in a circle) (function to protect persons).

## Two-hand circuit

This is a device which requires at least an action with both hands to start and maintain the operation of a machine as long as a hazard is present. Its purpose is to protect the operating person in this way [DIN EN 574].

NOTE: In order to initiate the hazardous operation, both operating elements must be simultaneously actuated (→ Discrepancy time monitoring). The enable signal is withdrawn when one of the two operating elements is released during the potentially dangerous motion. The dangerous operation can only be re-initiated if both operating elements have returned to their initial position and are then actuated again.

## Cyclic self-monitoring → Testing

## Cyclic test

A fault is automatically detected before or during the next request for the safety function, i.e. at each starting cycle of the → evaluation unit at the latest.

## 4. Safety-related switching functions

The standards mentioned in chapter 2 describe main requirements for safety-related switching circuits. The following is an extract from them.

### 4.1 Emergency stop circuits

In order to achieve a quick stop of a dangerous motion in emergency situations the reliable function of the emergency stop device is crucial. Therefore, appropriate circuits must prevent failures of devices downstream of an emergency stop command device or a properly functioning protective device.

## DIN EN 60204-1 Safety of machinery Electrical equipment

### Actions in an emergency (emergency stop)

DIN EN ISO 13850 describes the design principles for emergency stop equipment.

Emergency stop and emergency switching off are complementary protective measures for minimizing risks on machines (see DIN EN ISO 12100). Emergency stop is related to the actual operation of a machine, while emergency switching off is directly related to switching on/off. They are initiated by a single main action and must be maintained effective up to a manual reset action on the location where the emergency was initiated, as the control commands initiated by them. Resetting may only enable, but not execute the restarting or switching on.

### Emergency stop [DIN EN ISO 13850]

Emergency stop must be work in compliance with the stop categories 0 or 1 depending on the carried out risk assessment for the machine. The following applies in addition to the requirements for stopping:

- Priority above all other functions and operations in all operating modes
- An interruption of the energy supply to machine drives that may cause a hazardous situation must occur without further risks either immediately (stop category 0) or in a controlled way as quick as possible (stop category 1).

### Emergency switching off

Emergency switching off is the disconnection of the corresponding energy feed using electro-mechanical switching devices (stop category 0). If the stop category 0 is not allowed for the machine, other measures such as protection against direct touching may be required. Emergency switching off should be planned when dangers or damages are possible and the protection against direct touching is only realized by distances or obstacles.

### Stop functions

There are the following stop categories:

#### - Stop category 0:

Stopping by immediate interruption of the energy supply (to drive elements / uncontrolled stopping)

#### - Stop category 1:

Controlled stopping, the energy supply is maintained to accomplish stopping and is then interrupted.

#### - Stop category 2:

Controlled stopping, with the energy supply maintained.

## 4.2 Stop

Stop functions of the above categories must be taken into account as a result of risk assessment and requirements for the machine.

If required, facilities for connecting guards and interlocks must be provided (see SAFEMASTER® STS key transfer system).

A reset of the stop function must not initiate a hazardous situation. If required according to the risk assessment, stop commands must be effective for each control station.

### Combined start-stop controls

The use of pushbuttons and similar control devices that alternately start or stop a motion when actuated is only allowed for functions that cannot result in dangerous situations.

# Safety technique

## 4.3 Control functions in fault situations

### General requirements

Depending on the risk level of the concerned application, suited measures must be taken when failures or malfunction may cause hazardous situations or damages to the machine or production materials.

Electrical control circuits must be realized with adequate safety-relevant performance level that was determined by a risk assessment of the machine. The requirements of DIN EN 62061 and/or DIN EN ISO 13849 must be met.

Risk minimizing is possible by (not limited to):

- Protective equipment on the machine (e.g. SAFEMASTER® STS, emergency stop/switching off equipment, etc.)
- Safety interlocking of the electric circuit
- Providing of redundancy or diversity in part or completely
- Providing of function tests

Hazardous situations due to failure or removal of memory contents, e.g. removing batteries, must be prevented.

Unauthorized and accidental change of memory contents must be prevented by suited means, e.g. use of a key, etc.

### Use of partial or complete redundancy

The use of redundancy can minimize the probability that a single fault can result in a dangerous situation. When it is effective in normal operation it is referred to as online redundancy. A conception where specific circuits undertake the safety function only when the operational function fails is referred to as offline redundancy.

When offline redundancy is provided, which is not effective during operation, precautions must be taken to ensure that these control circuits will be effective when demanded.

### Use of diversity

Control circuits with different function principles or the use of different components and devices can reduce the probability of hazards due to faults and/or failures. These include, but are not limited to:

- NC-NO combinations, actuated by interlocked safety devices
- Use of control components of different design
- Combination of electro-mechanical and electrical equipment in redundant systems

A combination of electrical and non-electrical systems (e.g. mechanical, hydraulical, pneumatic) can perform the redundant function and provide for diversity.

## 4.4 Two-hand circuits

In ISO 13851, three types of two-hand circuits are defined that can be used depending on the risk assessment:

#### • Type I:

(not suited for the initiation of dangerous operations)

- Two control devices, simultaneous actuation by both hands
- Continuous and simultaneous actuation during the dangerous operation
- Stopping of machine operation when one or both control devices are released and the dangerous situation is still present

#### • Type II:

As type I, but both control devices must be released before the machine operation can be restarted.

#### • Type III:

As type II, but the simultaneous actuation must be as follows:

- Actuation of the control devices within a time of 0.5 sec.
- If this time is exceeded, both control devices must be released before the machine operation can be initiated again.

## 4.5 DIN EN 13850: Safety of machinery

### Emergency stop, design principles

#### Emergency stop, emergency stop function

- Prevent emerging dangers (dangers to persons, damages to machines and production materials) or minimize already existing risks
- Must be initiated by a single action of one person.

#### Emergency stop device

- Manually actuated control device for initiating an emergency stop function

#### General requirements

Emergency stop must be available and functioning at any time and must have priority over other functions and operations in all operating modes of the machine, but without affecting devices that are provided for the rescue of trapped persons.

Any start commands must not be able to affect an initiated emergency stop function until the emergency stop function is manually reset.

The emergency stop function should be designed as a complementary protective measure and must not be a substitute for protective measures or other safety functions or affect them in their effectiveness.

Depending on the risk assessment, the emergency stop function must be designed so that - after actuation of the emergency stop device - dangerous movements and the machine operations are stopped in a suited way without causing further hazards and without any intervention by any person.

“Suited way” may include:

- Selection of an optimal deceleration rate
- Selection of the stop category
- Application of a defined stopping sequence

An emergency stop must be designed so that the decision for actuation does not demand from a person considerations with respect to the effects resulting from this.

After operation of an emergency stop device/command, the effect of such a command must be maintained until it is manually reset. A reset must only be done on the location where the emergency stop command has been issued. A restarting must only be possible after a manual reset on this location.

The stop category must be selected according to the risk assessment for the machine:

#### • Stop category 0:

Stopping by

- Immediate interruption of the energy feed to driving components of the machine
- Mechanical separation (decoupling) between dangerous parts and their driving component (by braking if necessary)

#### • Stop category 1:

Controlled stopping with energy supply to driving components of the machine to achieve a stop, then - after standstill - interruption of the energy supply.

Interruption of the energy supply may include:

- Disconnecting the energy supply to electric motors of the machine
- Disconnecting movable parts of the machine from the source of mechanical energy
- Cutting off hydraulic/pneumatic energy sources to a piston/plunger

## 5 Functional safety - principles of design

### DIN EN 954-1

Up to November 2009, the standard DIN EN 954-1 could be used parallel with the successor standard DIN EN ISO 13849-1. After that, the standard DIN EN 954 becomes invalid.

#### Required safety-related performance

The required safety-related performance is implemented by the use of the standards DIN EN ISO 13849 or DIN EN 62061 and determined and defined in form of a system and risk analysis. For each detected danger, a safety function including validation must be specified. These standards provide supporting tools for defining the required safety integrity.

# Safety technique

## Application of DIN EN 62061 or DIN EN ISO 13849

- DIN EN ISO 13849:
  - Also for non-electric systems, e.g. mechanical, hydraulic, etc.
  - For specified architectures
  - Categories (→ DIN EN 954-1) are maintained, additional probabilistic component results in the PL (Performance Level) in the given category, thus different performance levels are possible for each category
- DIN EN 62061:
  - All electrical and electronic systems
  - All architectures
  - "Breaking down" of the safety-related electrical control system into safety-related control functions and evaluation of them → (Safety Integrity Level) SIL classification

## Tools in DIN EN ISO 13849 and DIN EN 62061

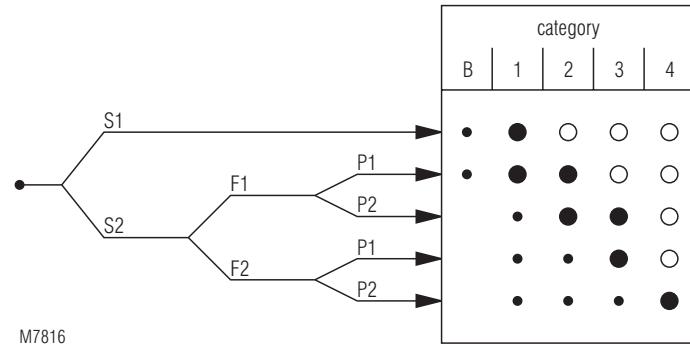

### Determination of the required safety integrity

Result of the risk analysis = required safety of the system

Safety functions with associated Safety Performance:

- DIN EN ISO 13849:
  - Risk graph, result = PL<sub>r</sub> per safety function
- DIN EN 62061:
  - Form "Risk assessment and safety measures",  
Result = SIL of the safety measure per risk

### Risk assessment and selection of an adequate category

### Risk graph in EN 954-1: 1997, Annex B

#### Risk parameter

##### S - Severity of injury

- S1 - minor (usually reversible) injury  
S2 - severe (usually irreversible) injury including death

##### F - Frequency and/or exposure duration (exposure to a risk)

- F1 - rare to more often and/or short time of risk exposure  
F2 - often to continuous and/or long time of risk exposure

##### P - Possibility to prevent risks or to restrict damages

- P1 - possible under certain conditions  
P2 - hardly possible

● Preferred category for reference points

• Possible categories that require additional measures

○ Measures that may be overdimensioned for the concerned risk

## DIN EN ISO 13849-1

The PL is determined by an estimate of following aspects:

- Quantifiable:
  - MTTF<sub>d</sub>
  - DC
  - CCF
  - Structure of the safety-related part of the control system → further parameters can have an influence, e.g. demand rate, test cycles, etc.
- Qualitative:
  - Behaviour of safety functions under fault conditions
  - Capability to perform safety functions under foreseeable environmental conditions, etc.

### Overview on advanced category definitions

#### • Category B (PL a,b):

- Usually single-channel
- CCF not relevant
- A single failure results in the loss of the safety function

#### • Category 1 (PL c):

- Meets category B
- A single failure results in the loss of the safety function, but the probability for this is lower than for category B

#### • Category 2 (PL a,b,c,d)

- Meets category B
- Test of the functionality in adequate time intervals
- In case of failure, initiation of a safe condition, at least warning on danger
- Measures against CCF (e.g. diversity, etc.)
- Test itself must not cause a danger
- A failure between the tests may result to the loss of the safety function, but is detected during the test.

#### • Category 3 (PL b,c,d):

- Meets category B
- Measures against CCF
- A single failure does not result in the loss of the safety function and must be detected before a new demand if possible.
- An accumulation of non-detected failures can result in the loss of the safety function.

#### • Category 4 (PL e):

- Meets category B
- Measures against CCF
- A single failure does not result in the loss of the safety function. It must be detected before a new demand or the accumulation of non-detected failures does not result in the loss of the safety function.
- Failures are detected in good time to prevent the loss of the safety function.
- Accumulation of unknown failures are considered.

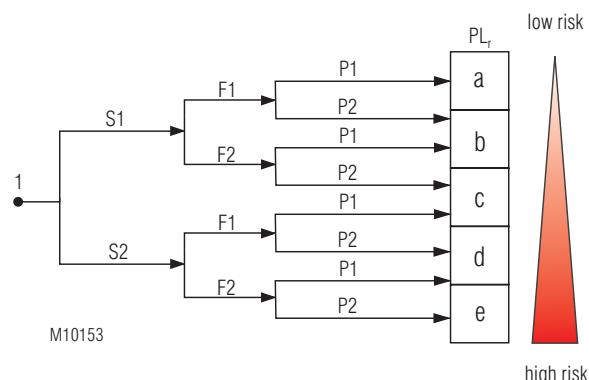

#### Note:

For high-quality products, also a PL e for a category-3 structure is possible due to reliability, for example.

**DOLD provides necessary new safety characteristic values for all products (on request if required), and for calculation we recommend the Sistema program which is provided free on the website of the employer's liability insurance association.**

# Safety technique

## New risk graph in DIN EN ISO 13849

### Risk parameters

#### S - Severity of injury

- S1 - minor (usually reversible) injury
- S2 - severe (usually irreversible) injury including death

#### F - Frequency and/or exposure duration (of the exposure to a risk)

- F1 - rare to more often and/or short time of risk exposure
- F2 - often to continuous and/or long time of risk exposure

#### P - Possibility to prevent risks or to restrict damages

- P1 - possible under certain conditions
- P2 - hardly possible

#### a,b,c,d,e,f

Objectives of the safety-related Performance Level

The risk assessment allows the designer to optimally adjust safety-related requirements to the machine-specific conditions depending on the application environment of the machine.

Both, the designer and the user are responsible for a correct risk evaluation.

The quantitative determination of the risk is difficult. So, the acceptable risk can be determined within a wide range when it comes to the selection of the category.

This becomes clear when selecting "F2 - frequently to continuously" rather than "F1 - rarely to more often" for the risk parameter "F - frequency and exposure duration" in the risk graph (see figure).

There is a wide range of safety levels between the assessments "more often" and "frequently".

## 6. Further safety measures

### Emergency switches

According to TRD 411 - 414, an emergency switch must be provided for the electrical switching off of the electrical parts of firing systems.

This emergency switch must directly or indirectly switch the circuits of electrical equipment of a firing system that must be switched off in an emergency situation.

According to EN 50156, two monitored switching off elements with function and device diversity are required for the safety cut-off of the whole fuel supply to the fire chamber.

### Cutout delay

For a controlled stopping according to the stop category 1, a delayed cut-out may be desired, e.g. to have a motor braking function run for purpose of a quick stopping of a dangerous movement.

### Timers

Timing relays used to limit minimum and maximum operating times of firing installations must meet the special requirements on the electrical equipment of firing installations on boilers specified by responsible professional associations and TÜV.

**Such timing relays** can be used to measure the operating times that must not be overrun and underrun, e.g. to measure the pre-ventilation time or to limit the safety time. Testing mainly occurs on the basis of the standard EN 50156 "Electrical equipment of firing installations".

Suited timing relays:

- AA 7512
- AA 7562
- AA 7610
- AA 7616
- EC 7610
- EC 7616
- EH 7610
- EH 7616

### Motor braking units

A frequent cause of industrial accidents is due to accidental reaching in running machines by operating persons or makeshift braking of machines with long coasting times. To respond effectively to these dangers of accident and thus to increase the safety at work, the Technical Committee for wood of the employer's liability insurance associations has defined in their test guideline GS-HO-01 the requirements for an automatically acting brake and the requirements for these brakes when no machine-specific standard exists. According to this, machines where the tool can be touched during their coasting must have an automatic brake if the unbraked coasting time is longer than 10 sec. For this, DOLD's comprehensive motor brake range offers both "simple" and also "complex" solutions.

**For the completion of technical safety products for the safety of machinery DOLD offers further innovative devices such as zero-speed monitors, wireless emergency stop equipment or the safety switch and key transfer system SAFEMASTER® STS.**

0276512

#### Your advantages

##### Cost Saving:

- Reduced wiring
- Cost saving simple installation

##### Robust Design:

- Fibre Reinforced Polymer-Version (FRP)
- Robust composite made of stainless steel and FRP
- All modules of a unit can be mounted separately

##### Optimised Ergonomics:

- Key and actuator modules can be mounted in 4 directions
- Plug-in keys for fast and easy operation
- Sophisticated design, high signal effect and easy handling

##### High Flexibility:

- Very flexible in concept, optimum adaptation to your process
- Easy to redesign when expanding systems
- Can be used for many applications, e. g. valves, gates, covers
- Compatible with the stainless steel version

##### Functionality and Safety:

- Protects against being locked in
- Over 46000 key codes
- Up to cat. 4, PL e (EN ISO 13849-1)

#### Approvals and marking

#### Additional information about this topic

- Datasheets, short description and system description about

#### Applications

Safety should not be difficult. The SAFEMASTER STS/K has been developed to offer efficient operation and optimum protection for dangerous areas protected by fences with gates access to the operator. In addition it protects against being locked inside the dangerous area during repair and maintenance.

#### The Idea

The safety concept adapts to specific customer demands with respect to the individual processes and not vice versa. Therefore it can be used in nearly all applications using safety fences and covers that are operated in rugged ambient conditions.

#### The Solution

SAFEMASTER STS/K is a modular, most flexible system solution of safety switches, interlocks, trapped key and command function combining the advantages of all 4 systems: the mechanical units can be integrated without wiring into the machine and plant concept and provide a cost effective protection solution for large applications to secure maintenance gates. It is also suitable for ATEX and high temperature applications. Electromechanical units are used to enable mechanical units and to protect frequently used entry points. In conjunction with safety controllers (e.g. SAFEMASTER series) dangerous movements are stopped when the gate to a dangerous area is opened, or the gate access is only enabled after the dangerous movement is stopped. The 46000 different key codes allow a forced or partly forced access sequence.

## The Components

The modular design of SAFEMASTER STS/K allows individual adaptation to the actual application. Using only few different basic modules a great number of functional units can be built by joining them via bayonet junctions. The function of a unit is dependant on the type of module and the mounting position. The combination of the different units define the function of the complete safety system.

## The System

The SAFEMASTER STS/K system offers far more than just the combination of safety switches and a key interlock system. It adds the advantages of both systems by the integration of wiringfree mechanical components and electrical safeguards. It is very flexible and is easily adapted to user requirements.

The system offers maximum safety and takes the requirements of the user concerning robustness, long life and user ergonomics into account. Special features are a robust composite made of stainless steel and FRP with ergonomic linear keys. It is flexible, can be easily extended and guarantees a safe and interruption free process, offering an intelligent and cost saving solution for industrial applications of all kinds.

With only a few single components, a number of individual interlock units can be assembled. Extensive equipment allows a simple mounting.

- 2 Actuator module B/K
- 3 Padlock module V/K
- 4 Bayonet ring /K
- 5 Key module /K
- 6 Switch modul /K
- 7 Guard lock module /K

Example: SX01BM/K

## Example

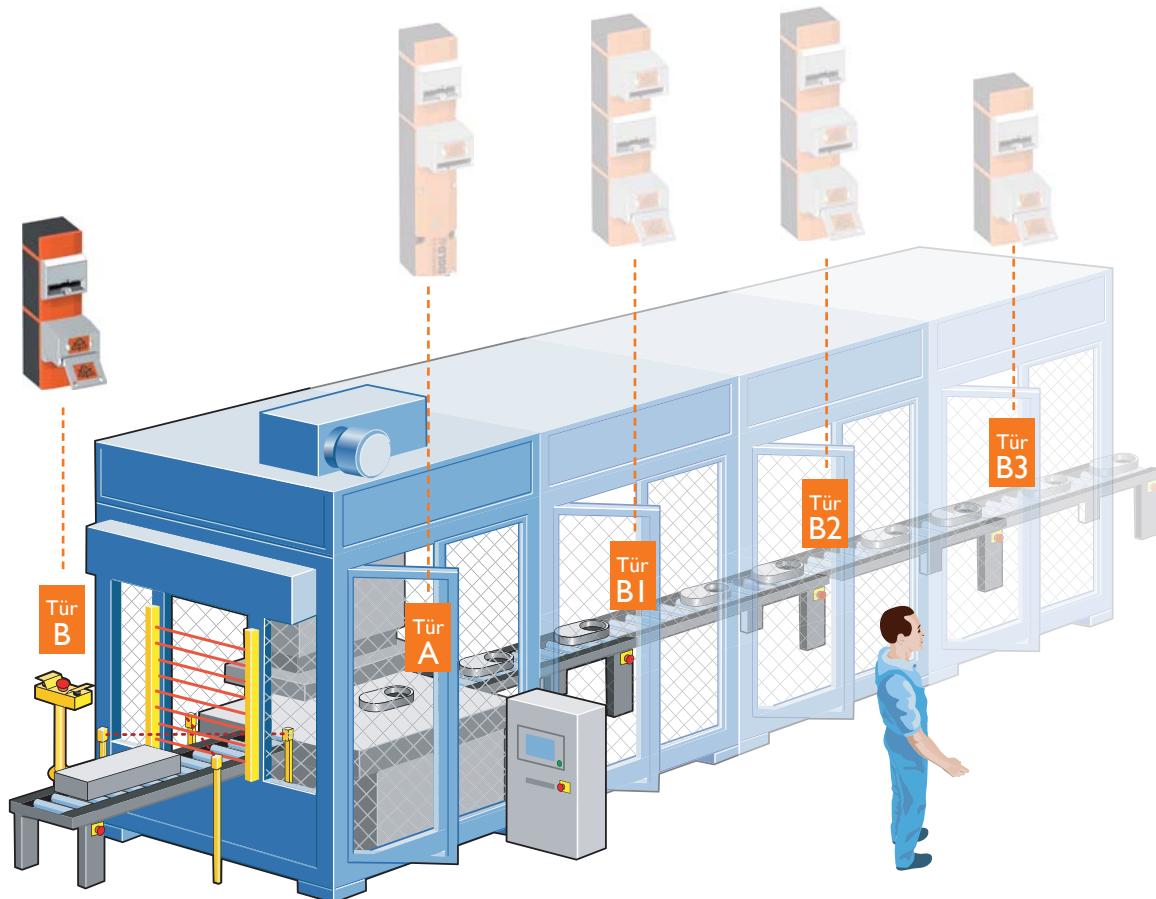

The SAFEMASTER STS/KProgram consists of modules that can be individually combined and adapted to your application. They combine the advantages of safety switches, interlock, key transfer and command function in one system.

The modular design allows systems to be assembled out of several units, or to modify and expand existing systems as required. All mechanical interlocks can be utilised in machine and plant concepts without wiring. They provide an economic and reliable protection in wide applications.

The picture shows a press with several access gates. When opening the main entry gate A during operation, the machine stops immediately. To open the maintenance gates B the following sequence has to be followed: Open gate A, take out coded key, insert key in gate B, open gate B. After reversing the procedure the production may be started again.

Further doors (e. g. B1, B2, B3) can be added later without wiring.

**Advantage:** The maintenance gates are made safe without wiring.

### Your advantages

#### Cost Saving:

- Reduced wiring
- Cost saving simple installation
- Mechanical (part) solutions save wiring cost

#### Robust Design:

- Stainless steel
- All modules of one unit can be mounted separate
- For harsh ambient conditions, e. g. vibration, extreme temperature, dust, moisture, dirt

#### Optimised Ergonomics:

- Key and actuator modules can be mounted in 4 directions
- Plug-in keys for fast and easy operation

#### High Flexibility:

- Very flexible in concept, optimum adaptation to your process
- Easy to redesign when expanding systems
- Can be used for many applications, e. g. valves, gates, covers
- Compatible with the lighter fibre reinforced polymer-version (FRP)

#### Functionality and Safety:

- Protects against being locked in
- Over 46000 key codes
- Up to Cat. 4, PL e (EN ISO 13849-1)

Continuous current limit curve output contacts

M11188

Continuous current limit curve semiconductor outputs

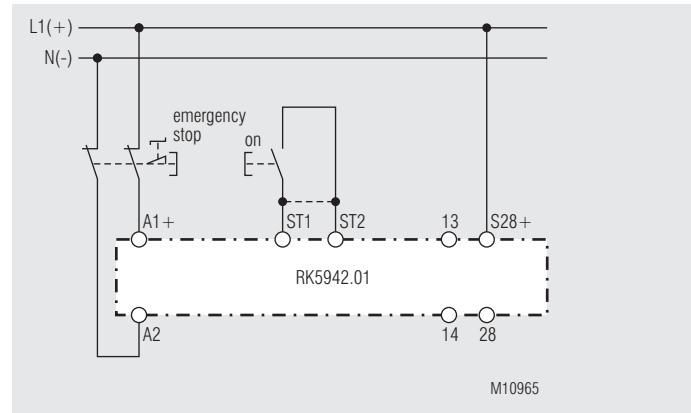

## Application Examples

Single channel emergency-stop circuit without feed back loop, with or without automatic restart.

For automatic restart terminals S12 - S34 must be linked.  
No ON-pushbutton necessary.

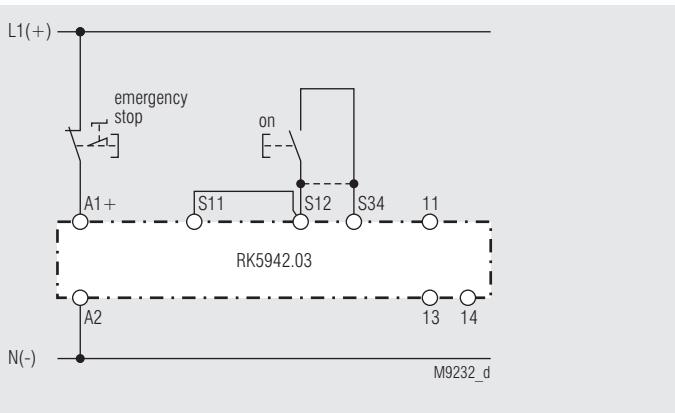

Suited up to SIL2, Performance Level d, Cat. 3\*

2-channel emergency-stop circuit without feed back loop, as option with or without automatic restart.

For automatic restart terminals S12 - S34 must be linked.  
No ON-pushbutton necessary.

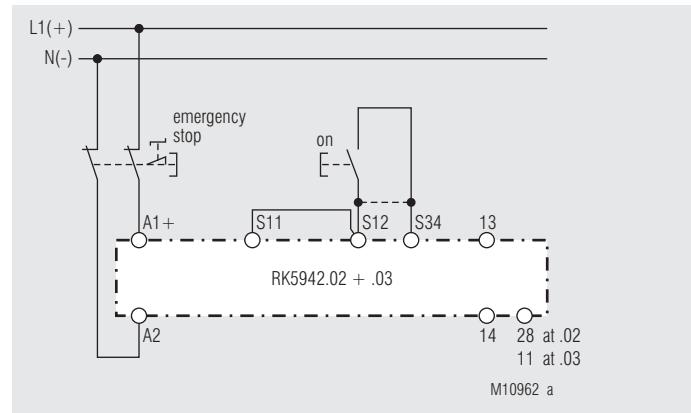

Suited up to SIL3, Performance Level e, Cat. 4

Single channel emergency-stop circuit without feed back loop, with or without automatic restart.

For automatic restart terminals S12 - S34 must be linked.  
No ON-pushbutton necessary.

Suited up to SIL2, Performance Level d, Cat. 3\*

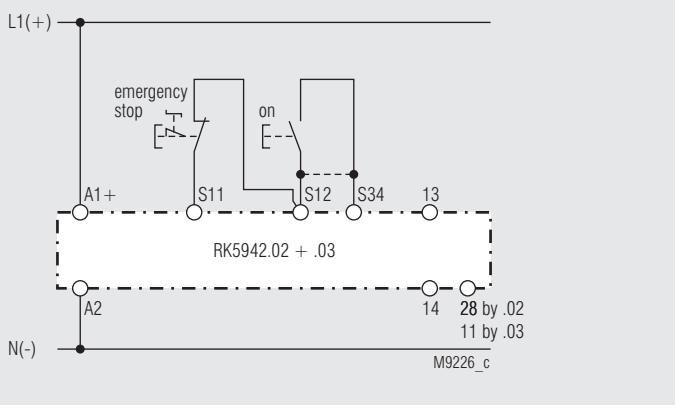

2-channel emergency-stop circuit without feed back loop, as option with or without automatic restart.

For automatic restart terminals S12 - S34 must be linked.  
No ON-pushbutton necessary.

**ATTENTION ! When this application is used with RK5942.02, it must be guaranteed that the external circuit on contact 28 has no feedback influence. I.e. no external voltage must be connected to contact 28.**

Suited up to SIL3, Performance Level e, Cat. 4

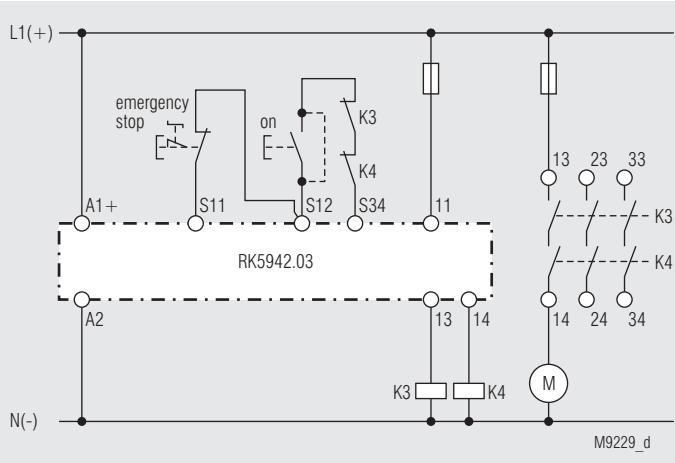

Single channel emergency-stop circuit without feed back loop, with or without automatic restart.

For automatic restart terminals S12 - S34 must be linked.  
No ON-pushbutton necessary.

Suited up to SIL2, Performance Level d, Cat. 3\*

<sup>\*)</sup> Suited up to SIL3, Performance Level e, Cat. 4, when the complete e-stop circuit is within the same cabinet.

## Application Examples

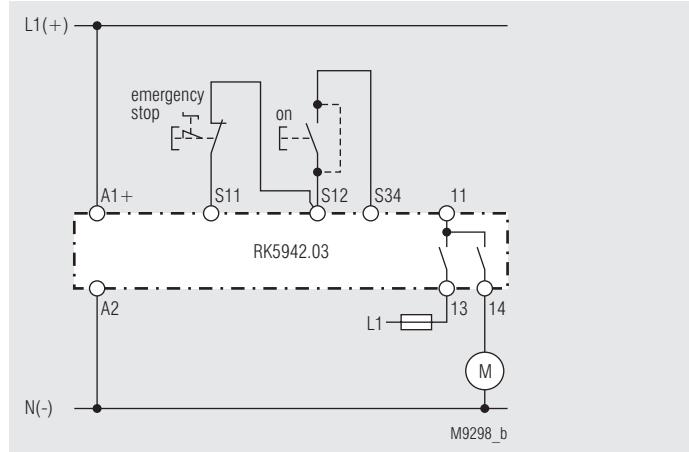

Contact reinforcement by external contactors.

At a thermal current  $I_{th} > 5$  A the output contacts can be reinforced by external contactors with forcibly guided contacts.

Functioning of the external contactors is monitored by looping the NC contacts into the start circuit (S12 - S34).

**ATTENTION !** For applications of safety stops the load must be connected to the contacts in series with 2 NO contacts.

Suited up to SIL2, Performance Level d, Cat. 3\*)

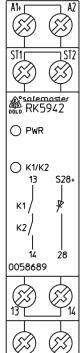

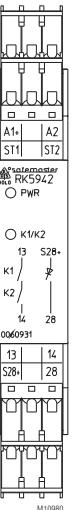

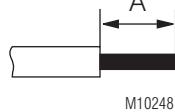

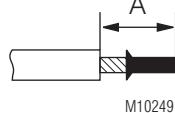

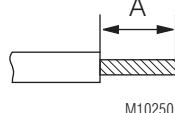

**ATTENTION !** For applications of safety stops the load must be connected to the contacts in series with 2 NO contacts.

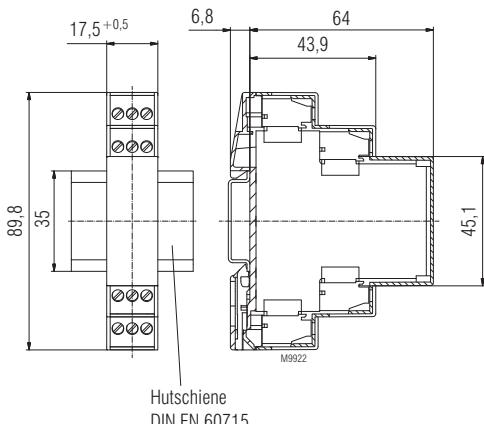

Suited up to SIL2, Performance Level d, Cat. 3\*)

**\*) Suited up to SIL3, Performance Level e, Cat. 4, when the complete e-stop circuit is within the same cabinet.**

## SAFEMASTER Emergency Stop Module UF 6925

**DOLD** 

0275136

### Product Description

The Emergency-Stop-Module UF 6925 is suitable to protect men and machine by safety related enabling or disabling of a safety circuit. It is used in applications with e-stop buttons and safety gates.

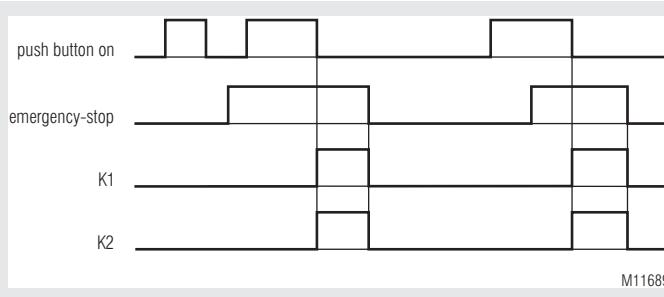

### Your Advantages

- For safety applications up to PL e / Cat. 4 e.g. SIL 3
- Space saving
- Connection front side
- Manual or automatic start
- Can be used also for safety gate
- Line fault detection on On-button

### Features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508 and IEC/EN 61511
- According to EN 50156-1 for furnaces
- 2-channel operation
- Forcibly guided output contacts
- With or without cross fault monitoring in the E-stop loop, switch S1
- Manual restart or automatic restart, switch S2
- LED indicator for channel 1, 2 and Netz
- Width 17,5 mm

### Function Diagram

### Approvals and Markings

### Applications

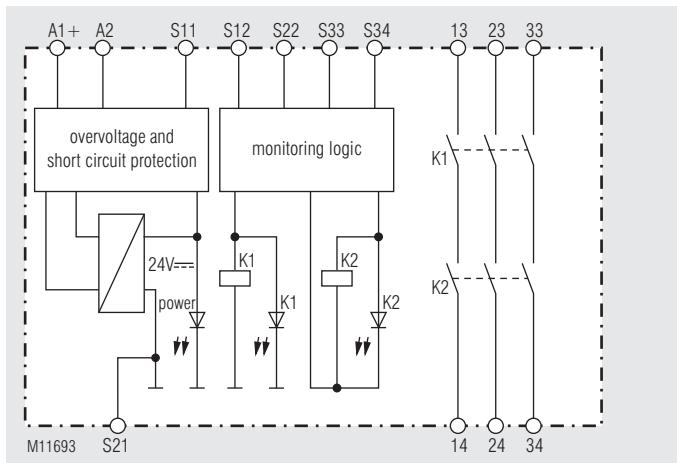

Protection of people and machines

- Emergency stop circuits on machines
- Monitoring of position switches on a safety gate

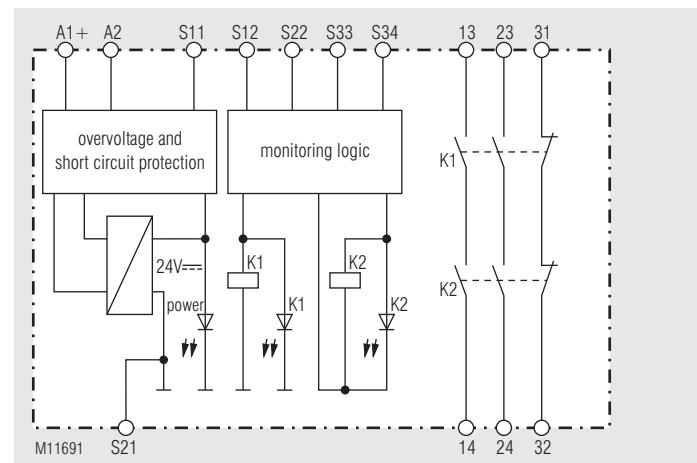

### Indicators

- green LED Netz: on when supply connected  
green LED K1: on when relay K1 energized  
green LED K2: on when relay K2 energized

### Block Diagrams

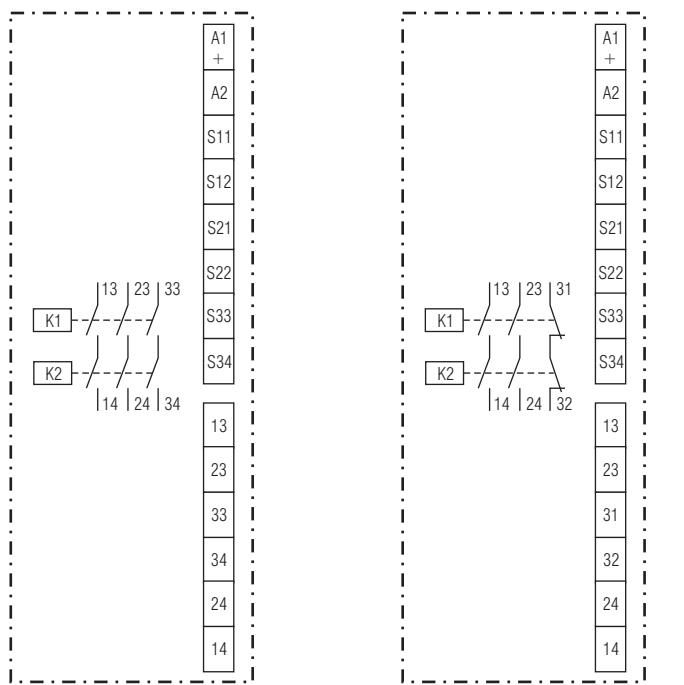

UF 6925.03

UF 6925.22

## Circuit Diagrams

UF 6925.03

UF 6925.22

## Notes

### Setting Cross fault detection

Switch S1 is for selecting with or without cross fault detection at the e-stop button resp. on safety gate.  
For connection please see application examples.

**ATTENTION! The setting of S1 has to be made before starting the device.**

### Setting Start-Mode

S2 is used to change between automatic and manual restart. On automatic start also the terminals S33 - S34 have to be linked.

With the function manual start a start button has to be connected to terminals S33-S34. The unit starts up with the negative edge of the start button signal.

For connection please see application examples.

**ATTENTION! The setting of S2 has to be made before starting the device.**

### Line fault detection on On-button

A line fault detection is only active when S12 and S22 are switched simultaneously. If The On-button is closed before S12, S22 is connected to voltage (also when line fault across On-Button), the output contacts will not close. A line fault across the On-button which occurred after activation of the relay, will be detected with the next activation and the output contacts will not close.

**ATTENTION! If a line fault is removed while the unit is powered up, the unit switches on.**

## Connection Terminals

Terminal designation	Signal description
A1+	+
A2	-
S12, S22, S34	Control inputs
S11, S21, S33	Control outputs
13, 14, 23, 24, 33, 34	Forcibly guided NO contacts for release circuit
31, 32	Forcibly guided indicator output

## Technical Data

### Input

#### Nominal Voltage $U_N$ :

DC 24 V, DC 8 ... 36 V  
The power supply shall meet the requirements of SELV / PELV

#### Voltage range

DC 24 V: 0.8 ... 1.1  $U_N$

#### Nominal consumption at DC 24 V:

< 1.6 W

#### DC 8 ... 36 V:

< 2.2 W

#### Min. Off-time:

150 ms

#### Control voltage on S11 at not activated device:

DC 23 V at  $U_N$

#### Control current typ. over S12, S22:

30 mA at  $U_N$

#### Min. voltage on terminal S12 at not activated device:

DC 19 V

#### Short-circuit protection:

Internal PTC

#### Oversupply protection:

Internal VDR

### Output

#### Contacts

UF 6925.03: 3 NO contacts  
UF 6925.22: 2 NO contacts, 1 NC contact

#### The NO contacts are safety contacts.

#### The NC contacts 31-32 can only be used for monitoring.

#### Operating time at $U_N$ :

< 350 ms

#### Release delay at $U_N$ :

in case of break of supply voltage:  
DC 24 V: < 20 ms

DC 8 ... 36 V: < 90 ms

in case of break of S12, S22: < 25 ms

#### Contact type:

#### Thermal current $I_{th}$ :

#### Switching capacity to AC 15

NO contact:	3 A / AC 230 V	IEC/EN 60 947-5-1
NC contact:	1 A / AC 230 V	IEC/EN 60 947-5-1
to DC 13		
NO contact:	2 A / 24 V	IEC/EN 60 947-5-1
NC contact:	2 A / 24 V	IEC/EN 60 947-5-1
to DC 13		
NO contact:	4 A / 24 V at 0.1 Hz	IEC/EN 60 947-5-1
NC contact:	4 A / 24 V at 0.1 Hz	IEC/EN 60 947-5-1

#### Electrical life

at AC 230 V, 8 A, cos φ = 1: > 1.0 x 10<sup>5</sup> switching cycles (at 1 s On, 1 s Off)

#### Permissible operating frequency:

#### Short circuit strength

max. fuse rating:

line circuit breaker:

#### Mechanical life:

max. 1 200 Schaltspiele / h  
8 A gL IEC/EN 60 947-5-1  
B 6 A  
> 40 x 10<sup>6</sup> switching cycles

### General Data

#### Operating mode:

#### Temperature range

Operation: - 25 ... + 55 °C  
Storage: - 25 ... + 85 °C  
Altitude: < 2,000 m

#### Clearance and creepage distances

Rated impuls voltage / pollution degree:

4 kV / 2 IEC 60 664-1  
IEC/EN 61 326-3-1

#### EMC:

Interference suppression

DC 24 V:

Limit value class B EN 55 011  
Limit value class A\*) EN 55 011

\*) The device is designed for the usage under industrial conditions (Class A, EN 55011). When connected to a low voltage public system (Class B, EN 55011) radio interference can be generated. To avoid this, appropriate measures have to be taken.

## Technical Data

### Degree of protection:

Housing:	IP 40	IEC/EN 60 529
Terminals:	IP 20	IEC/EN 60 529

**Housing:** thermoplastic with V0 behaviour according to UL subject 94

**Vibration resistance:** Amplitude 0,35 mm

**Climate resistance:** Frequenz 10 ... 55 Hz, IEC/EN 60 068-2-6

**Terminal designation:** 25 / 055 / 04 IEC/EN 60 068-1

**Mounting:** EN 50 005

**Weight:** DIN rail IEC/EN 60 715

140 g

### Dimensions

**Width x height x depth:** 17.5 x 110 x 120 mm

### UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL60947, "general use applications"

#### Standards:

- ANSI/UL 60947-1, 5<sup>th</sup> Edition (Low-Voltage Switchgear and Controlgear Part1: General rules)
- ANSI/UL 60947-5-1, 3<sup>rd</sup> Edition (Low-Voltage Switchgear and Controlgear Part5-1: Control circuit Devices an Switching Elements - Electro-mechanical Control Circuits Devices)
- CAN/CSA-C22.2 No. 60947-1-13, 2<sup>nd</sup> Edition (Low-Voltage Switchgear and Controlgear - Part1: General rules)
- CAN/CSA-C22.2 No. 60947-1-14, 1<sup>st</sup> Edition (Low-Voltage Switchgear and Controlgear - Part5-1: Control circuit Devices an Switching Elements - Electromechanical Control Circuits Devices)

#### Switching capacity:

UF 6925.03:	Pilot duty B300, Q300
	6A 250Vac Resistive
	6A 24Vdc Resistive

UF 6925.22:	Pilot duty B300, Q300
	8A 250Vac Resistive
	8A 24Vdc Resistive

**Wire connection:** min. 60°C copper conductors AWG 28 - 14

Technical data that is not stated in the UL-Data, can be found in the technical data section.

### Standard Type

UF 6925.03/61 DC 8 ... 36 V

0067556

Article number:

- Output: 3 NO contacts
- Nominal voltage  $U_N$ : DC 8 ... 36 V
- Width: 17.5 mm

## Variants

### UF 6925\_/\_/\_ /1 \_/\_:

For switching small loads of 10 mVA ... 12 VA bzw. 10 mW ... 12 W in the ranges 2 ... 60 V und 2 ... 300 mA.

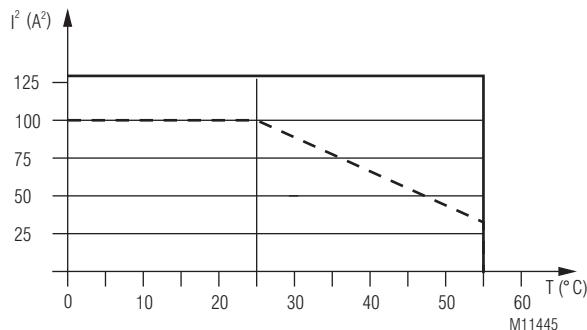

The device is also suitable for switching the maximum switching current. However, this will burn off the gold plating of the contacts, so that switching of small loads is no longer possible afterwards.

### Ordering example for variants

UF 6925 .03 /\_/\_ /61 DC 8 ... 36 V

- Nominal voltage  
DC 24V  
DC 8 ... 36V

$I_1, I_2$  - current in contact paths

Quadratic total current limit curve DC 8 - 36 V

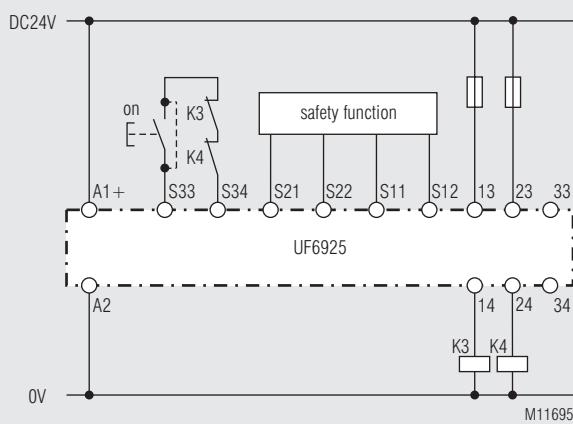

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	- Power supply not connected - Cross fault between S11 and S21
LED "K1" lights up, but "K2" remains off	- Safety relay K1 is welded (replace device) - A 1-channel switch-off occurred on S12 (switch channel off on S22)
LED "K2" lights up, but "K1" remains off	- Safety relay K2 is welded (replace device) - A 1-channel switch-off occurred on S22 (switch channel off on S12)
Device cannot be activated	- A safety relay is welded (replace device) - Incorrect setting of switch S1 Manual start mode: - Line fault on start-button (disconnect power supply and remove fault) Automatic start mode: - S33-S34 not bridged

## Maintenance and repairs

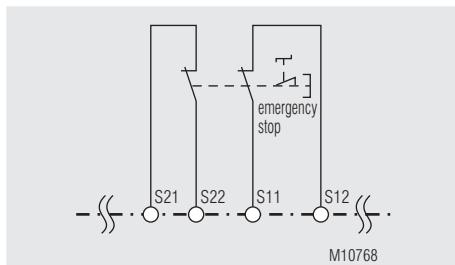

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Application Examples

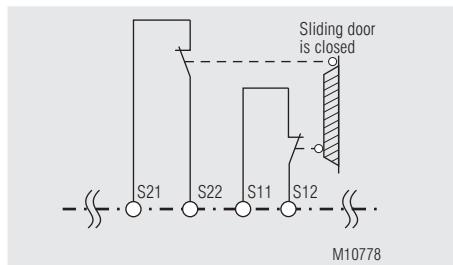

A jumper must be fitted S33 - S34 for the automatic On function. The On pushbutton is not required. The required start function has to be selected on switch S1 before starting the device. (see "Unit Programming"). Functioning of the external contactors is monitored by looping the NC contacts into the closing circuit (terminals S33 - S34).

### Safety function for units with cross fault detection (pay attention to "Unit Programming"!)

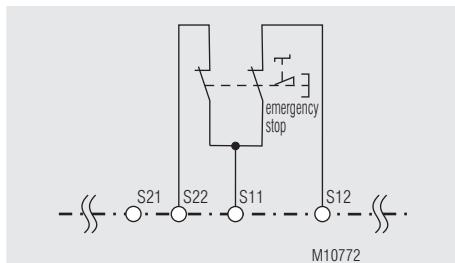

Fkt.: E-stop  
SIL 3, PL e, Cat. 4

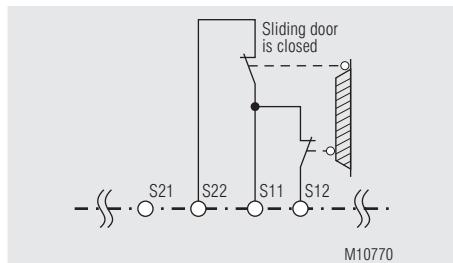

Fkt.: Safety gate  
SIL 3, PL e, Kat. 4

### Safety function for units without cross fault detection (pay attention to "Unit Programming"!)

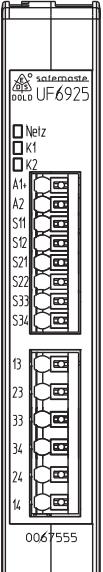

Fkt.: E-stop  
SIL 3, PL e, Cat. 4<sup>1)</sup>

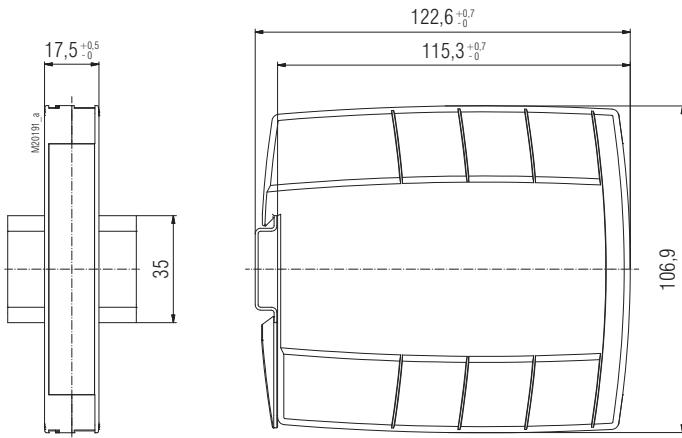

Fkt.: Safety gate  
SIL 3, PL e, Cat. 4<sup>1)</sup>

<sup>1)</sup> To achieve the safety classifications a crossfault safe wiring has to be installed.

## SAFEMASTER Emergency Stop Module BG 5924, IP 5924

**DOLD** 

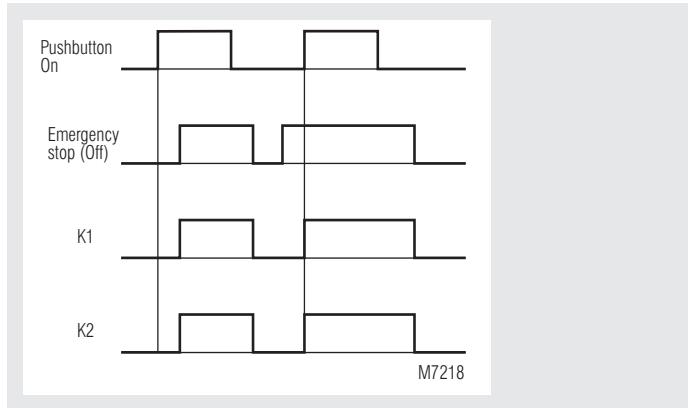

0225592

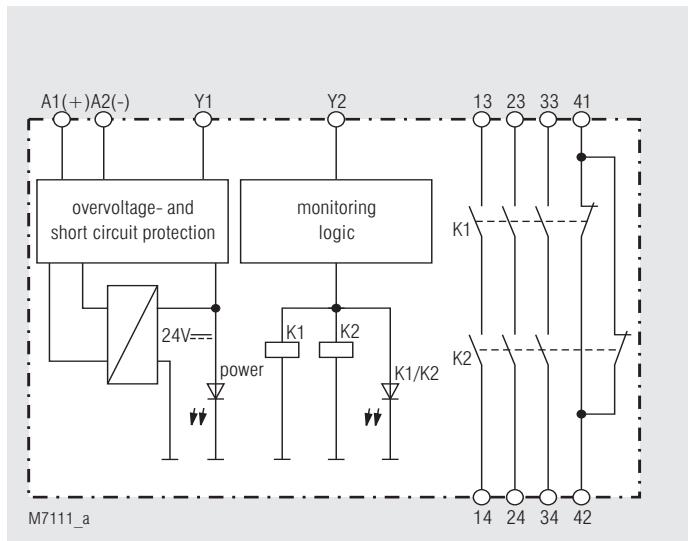

### Product Description

The emergency stop modules BG 5924 and IP 5924 can be used to protect people and machines by interrupting a safety circuit in a safe way.

### Function Diagram

### Block Diagrams

BG 5924.48, IP 5924.48

### Your Advantages

- For safety application up to PL e / Cat. 4 e.g. SIL 3
- Manual or automatic start

### Features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508
- According to EN 50156-1 for furnaces
- Single channel or two-channel operation
- Output: max. 4 NO contacts
- AC 230 V model with galvanic separation
- LED indicator for channel 1 / 2 and state of operation
- Short circuit detection between terminal Y1 and common
- BG 5924 with:
  - Removable terminal strips
  - Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled (isolated), DIN 46 228-1/-2/-3/-4 or 2 x 2.5 mm<sup>2</sup> stranded ferruled DIN 46 228-1/-2/-3
- BG 5924: width 22.5 mm
- IP 5924: width 70 mm

### Approvals and Markings

\* see variants

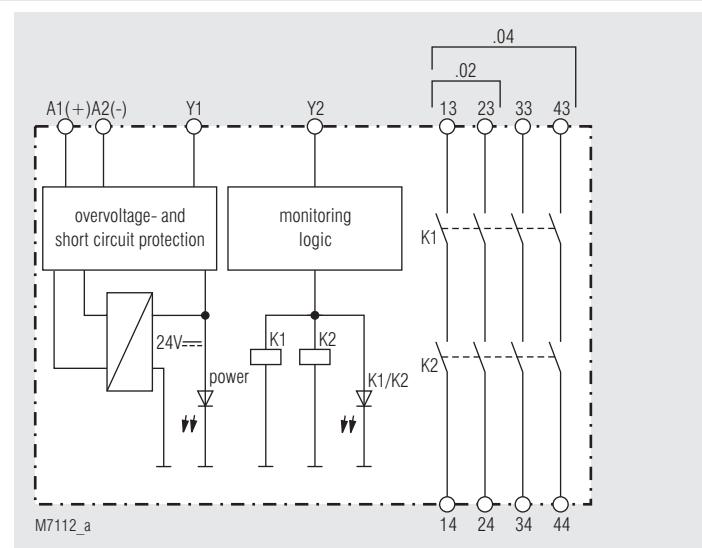

<sup>1)</sup> for BG 5924 only

### Applications

- Protection of people and machines
- Emergency stop circuits on machines

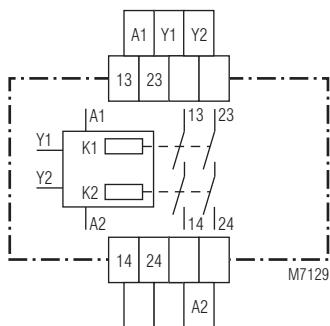

### Indicators

Troubleshooting	
<b>Failure</b>	<b>Potential cause</b>
LED "Netz" does not light up	Power supply not connected
Device cannot be activated	- Safety relay is welded (replace device) - Start circuit Y1-Y2 not connected
Maintenance and repairs	
- The device contains no parts that require maintenance. - In case of failure, do not open the device but send it to manufacturer for repair.	

## Standard Types

BG 5924.48 AC/DC 24 V

Article number: 0050982

- Output: 3 NO, 1 NC contacts

AC/DC 24 V

- Nominal voltage  $U_N$ : 22.5 mm

IP 5924.48 AC/DC 24 V 50/60 Hz

Article number: 0053262

- Output: 3 NO, 1 NC contacts

AC/DC 24 V

- Width: 70 mm

## Variants

BG 5924.\_\_\_\_/60:

with CSA approval

BG 5924.\_\_\_\_/61:

with UL approval

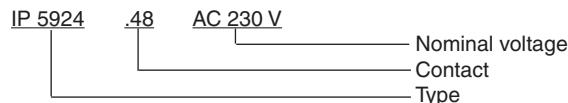

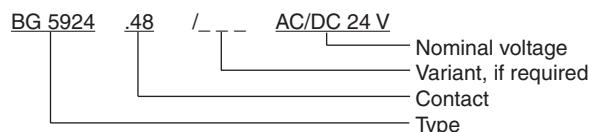

BG 5924.\_\_\_\_/100:

with fast auto-start

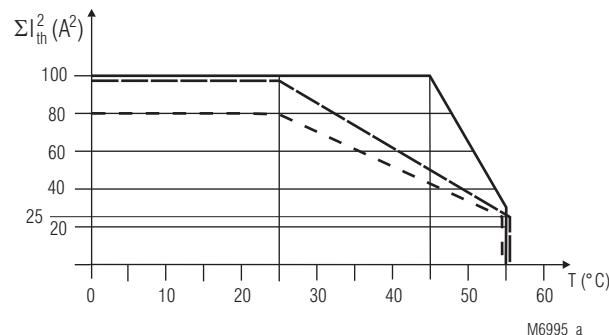

BG 5924.\_\_\_\_/110:

0.85 ... 1.15  $U_N$

## Ordering example for Variant

## Characteristics

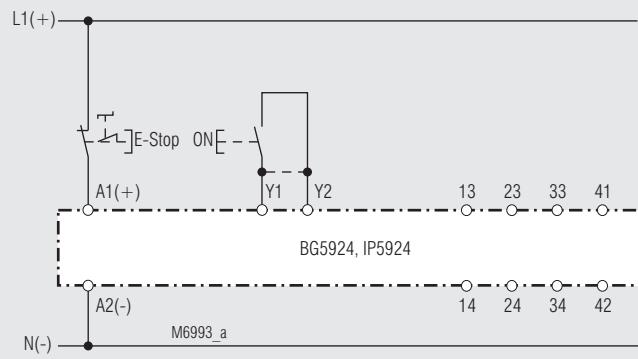

quadratic total current

$$\Sigma I_{th}^2 = I_{th1}^2 + I_{th2}^2 + I_{th3}^2 + I_{th4}^2$$

$I_{th1}$ ,  $I_{th2}$ ,  $I_{th3}$ ,  $I_{th4}$  : thermal current  $I_{th}$  on contact rows

Total current limit curve

## Application Examples

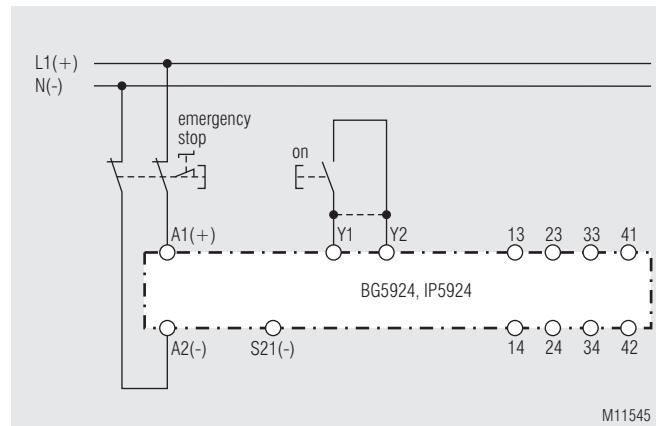

Single channel emergency-stop circuit without feed back loop, with or without automatic restart.

For automatic restart terminals Y1-Y2 must be linked.

No ON-push button necessary.

Suited up to SIL2, Performance Level d, Cat. 3\*

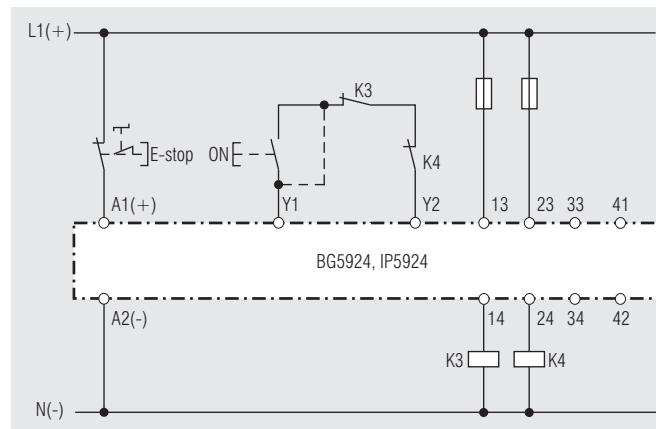

Two-channel emergency-stop circuit without feed back loop, with or without automatic restart.

For automatic restart terminals Y1-Y2 must be linked.

No ON-push button necessary.

Suited up to SIL3, Performance Level e, Cat. 4

Contact reinforcement by external contactors, 2-channel controlled. For currents > 5 A the output contacts can be reinforced by external contactors. Functioning of the external contactors is monitored by looping the NC contacts into the start circuit (Y1-Y2).

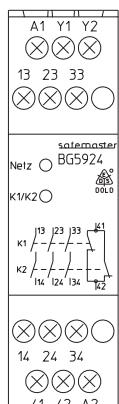

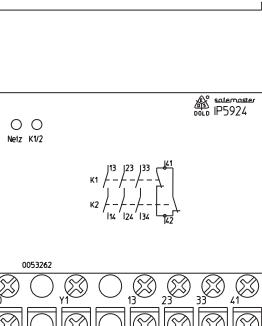

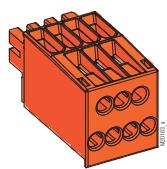

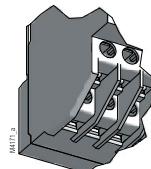

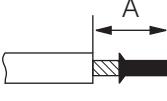

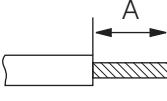

Suited up to SIL2, Performance Level d, Cat. 3\*

\* Suited up to SIL3, Performance Level e, Cat. 4 for E-stop systems according to IEC 60947-5-5, under the following conditions:

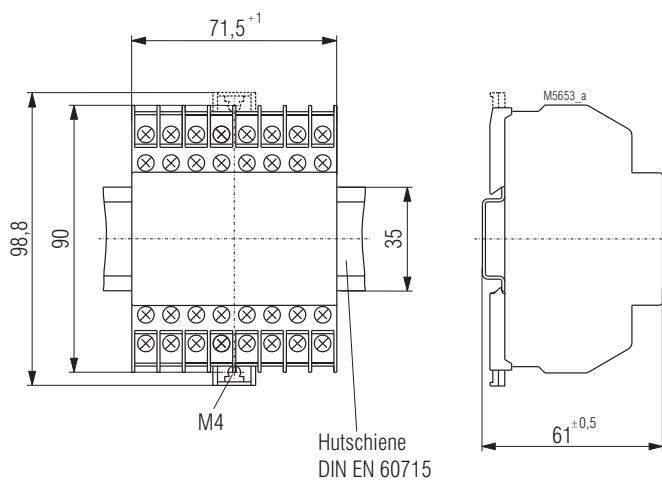

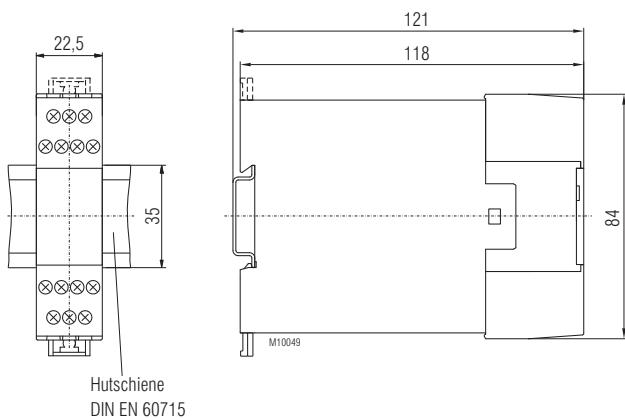

- A maximum number of operations for the E-stop button is observed

- The E-stop button and the E-stop module are installed in the same cabinet

## SAFEMASTER Emergency Stop Module BG 5925

**DOLD** 

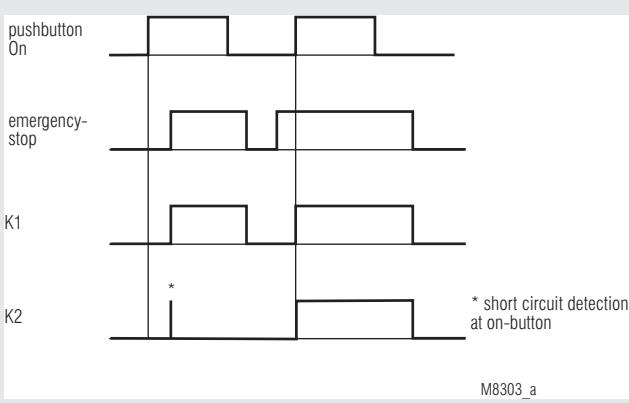

0224208

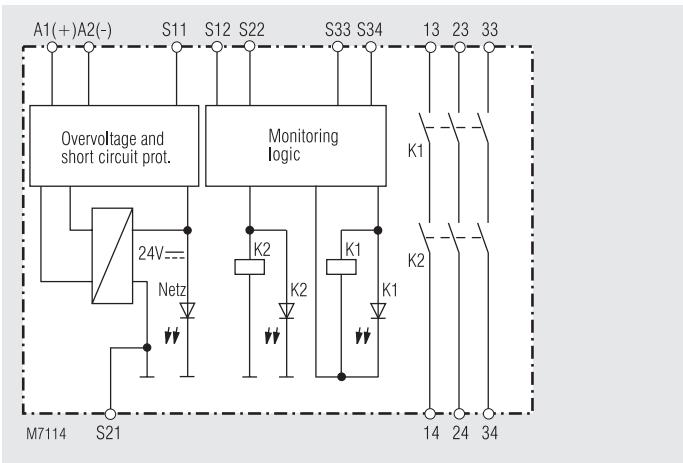

### • According to

- Performance Level (PL) e and category 4 to EN ISO 13849-1
- SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
- Safety Integrity Level (SIL) 3 to IEC/EN 61508
- Output: max. 3 NO contacts, see contacts
- Single and 2-channel operation
- Line fault detection on On-button
- Manual restart or automatic restart, switch S2
- With or without cross fault monitoring in the E-stop loop, switch S1
- LED indicator for channel 1 and 2 and Power
- Removable terminal strips
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled (isolated), DIN 46 228-1/-2/-3/-4 or 2 x 2.5 mm<sup>2</sup> stranded ferruled DIN 46 228-1/-2/-3
- Width 22.5 mm

### Function Diagram

### Block Diagram

### Connection Terminals

Terminal designation	Signal description
A1+	+ / L
A2	- / N
S12, S22, S33, S34	Inputs
S11, S21	Outputs
13, 14, 23, 24, 33, 34	Forcibly guided NO contacts for release circuit
21, 22, 31, 32	Forcibly guided indicator output

### Approvals and Markings

\* see variants

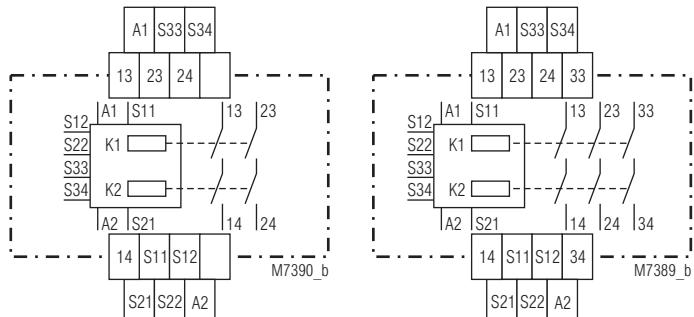

### Applications

- Protection of people and machines
- Emergency stop circuits on machines
  - Monitoring of safety gates

### Indicators

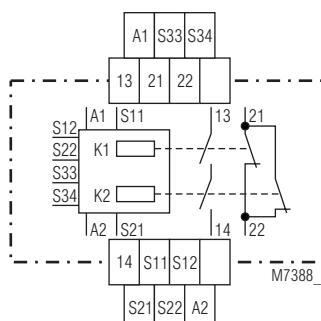

- LED Power: on when supply connected  
LED K1/K2: on when relay K1/K2 energized

Disconnect unit before setting of S1  
Drawing shows setting at the state of delivery

## Notes

### Line fault detection on On-button:

The line fault detection is only active when S12 and S22 are switched simultaneously. If the On-button is closed before S12, S22 is connected to voltage (also when line fault across On-Button), the output contacts will not close.

A line fault across the On-button which occurred after activation of the relay, will be detected with the next activation and the output contacts will not close. If a line fault occurs after the voltage has been connected to S12, S22, the unit will be activated because this line fault is similar to the normal On-function. The gold plated contacts of the BG 5925 mean that this module is also suitable for switching small loads of 1 mVA - 7 VA, 1 mW - 7 W in the range 0.1 - 60 V, 1 - 300 mA. The contacts also permit the maximum switching current. However since the gold plating will be burnt off at this current level, the device is no longer suitable for switching small loads after this (not for variant BG 5925.22/102).

The terminal S21 permits the operation of the device in IT-systems with insulation monitoring, serves as a reference point for testing the control voltage and is used to connect the E-stop loop when cross fault monitoring is selected.

Connecting the terminal S21 to the protective ground bridges the internal short-circuit protection of Line A2 (-). The short-circuit protection of line A1 (+) remains active.

To alter the functions automatic start - manual start and with or without cross fault monitoring, the switches S1 and S2 are used. These are located behind the front cover (see unit programming).

The setting with or without cross fault monitoring on E-stop buttons is made with S1. S2 is used to change between automatic and manual restart. On automatic start also the terminals S33 - S34 have to be linked. For connection please see application examples.

## Technical Data

### Input circuit

<b>Nominal Voltage <math>U_N</math>:</b>	DC 24 V, AC/DC 24 V	
<b>Voltage range</b>	DC	AC/DC
at 10% residual ripple:	0.9 ... 1.1 $U_N$	0.95 ... 1.1 $U_N$
at 48% Residual ripple:	0.8 ... 1.1 $U_N$	0.8 ... 1.1 $U_N$
<b>Nominal consumption:</b>	DC approx. 2 W	
<b>Min. Off-time:</b>	250 ms

BG 5925.02/104:	Automatic restart, with cross fault monitoring for DC 24 V Switching capacity to AC 15: 5 A / 230 V Contact fuse 6 A fast / 4 A slow without internal switches S1 and S2

### Ordering example for variants

Technical data that is not stated in the UL-Data, can be found in the technical data section.

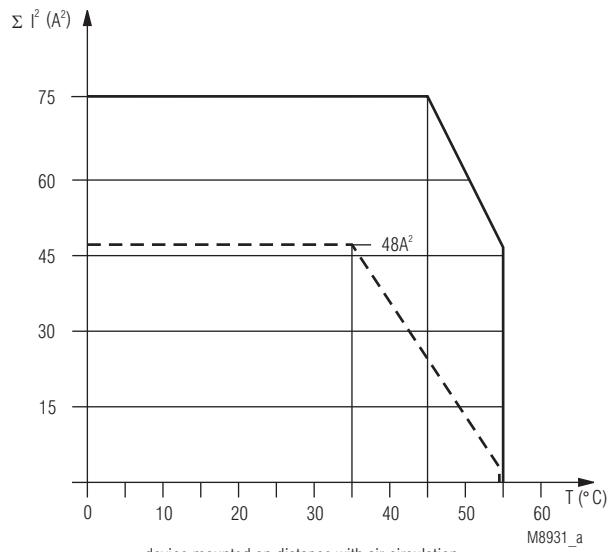

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	- Power supply not connected - Cross fault between S11 and S21
LED "K1" lights up, but "K2" remains off	- Safety relay K1 is welded (replace device) - A 1-channel switch-off occurred on S12 (switch channel off on S22)
LED "K2" lights up, but "K1" remains off	- Safety relay K2 is welded (replace device) - A 1-channel switch-off occurred on S22 (switch channel off on S12)
Device cannot be activated	Manual start mode: - Line fault on start-button (disconnect power supply and remove fault) Automatic start mode: - S33-S34 not bridged - A safety relay is welded (replace device) - Incorrect setting of switch S1

## Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristics

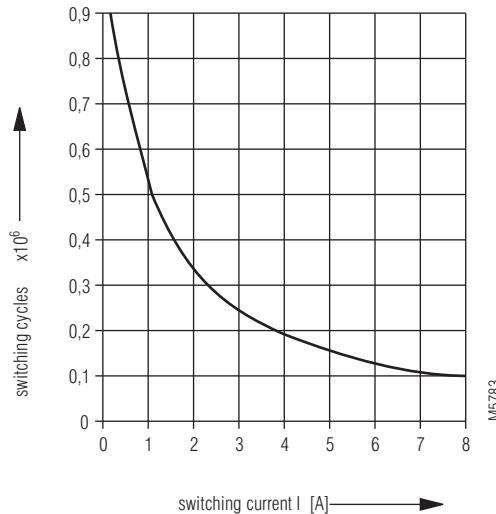

device mounted without distance heated by  
devices with same load,  
max current at 55°C over  
3 contactrows =  $1A \cong 3 \times 1^2 A^2 = 3 A^2$

$$\Sigma I^2 = I_1^2 + I_2^2 + I_3^2$$

$I_1, I_2, I_3$  - current in contactrows

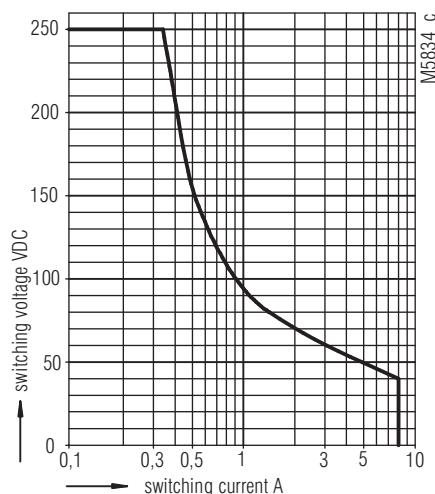

## Quadratic total current limit curve

electric life DC13 24V DC /  $t_{on}$  0,4s;  $t_{off}$  9,6s  
2 contacts in series

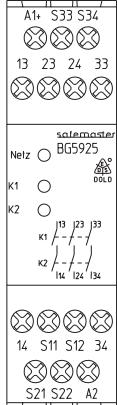

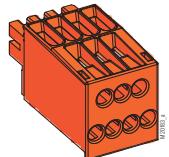

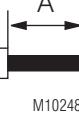

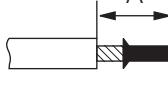

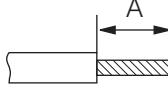

## Contact service life

**SAFEMASTER**  
**Emergency Stop Module**  
**LG 5924**

**DOLD** 

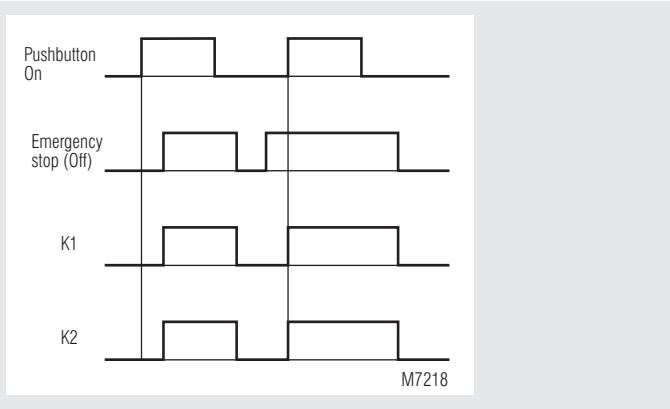

0249759

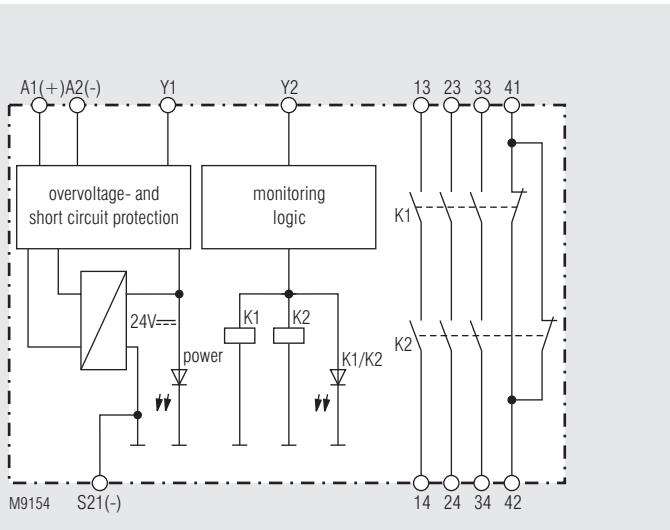

## Product Description

The emergency stop modules LG 5924 can be used to protect people and machines by interrupting a safety circuit in a safe way.

## Function Diagram

## Block Diagrams

LG 5924.48

## Your Advantages

- For safety application up to PL e / Cat. 4 resp. SIL 3
- Manual or automatic start

## Features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508
- According to EN 50156-1 for furnaces
- Single channel or two-channel operation
- Output: max. 4 NO contacts
- AC 230 V model with galvanic separation
- LED indicator for channel 1 / 2 and state of operation
- Short circuit detection between terminal Y1 and common
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled, or 2 x 2.5 mm<sup>2</sup> solid DIN 46 228-1/-2/-3/-4
- as option with pluggable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width 22.5 mm

## Approvals and Markings

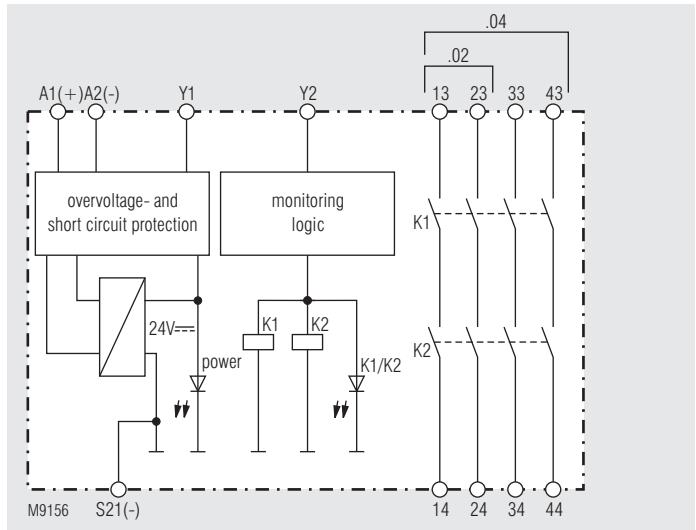

## Applications

- Protection of people and machines
- Emergency stop circuits on machines

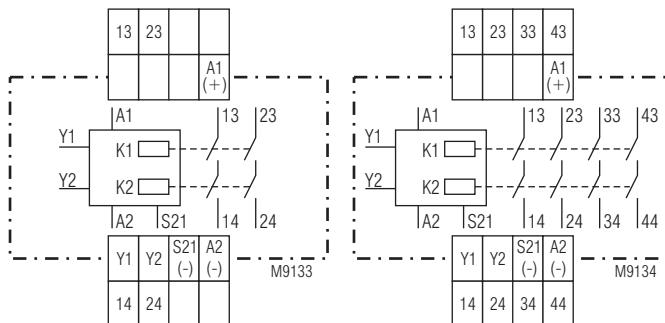

## Indicators

LED Phase: on, when supply connected  
LED K1/K2: on, when relay K1 and K2 energized

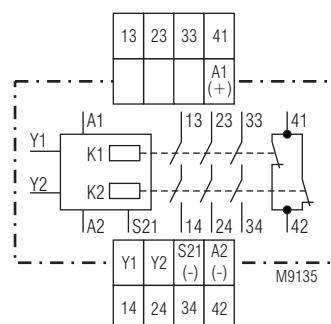

LG 5924.02, LG 5924.04

## Circuit Diagrams

LG 5924.02

LG 5924.04

LG 5924.48

## Connection Terminals

Terminal designation	Signal description
A1(+)	+ / L
A2 (-)	- / N
Y2	Inputs
S21(-), Y1	Outputs
13, 14, 23, 24, 33, 34, 43, 44	Forcibly guided NO contacts for release circuit
41, 42	Forcibly guided indicator output

## Technical Data

### Input

**Nominal voltage  $U_N$ :**

DC 24 V  
AC 110, 230 V

**Nominal frequency:**

50 / 60 Hz

**Voltage range:**

AC 0.85 ... 1.1  $U_N$   
DC 0.9 ... 1.1  $U_N$   
DC 0.85 ... 1.1  $U_N$

**Nominal consumption**

DC: DC 1.5 W  
AC: 3.5 VA

**Control voltage on Y1**

DC: typ. DC 22 V  
AC: typ. DC 45 V

**Control current**

DC: typ. DC 65 mA  
AC: typ. AC 16 mA

**Recovery time:**

0.5 s

### Output

#### Contacts

LG 5924.02: 2 NO contacts  
LG 5924.04: 4 NO contacts  
LG 5924.48: 3 NO, 1 NC contacts

The NO contacts are safety contacts.

The NC contacts 41-42 can only be used for monitoring.

#### Operate delay

DC: typ. DC 40 ms  
AC: typ. AC 200 ms

#### Release delay

DC: typ. DC 70 ms  
AC: typ. AC 35 ms

**Contact type:** forcibly guided

## Technical Data

**Thermal current  $I_{th}$ :**

max. 5 A  
(see quadratic total current limit curve)  
AC 250 V

**Nominal output voltage:**

**Switching capacity**

to AC 15  
NO contact: 3 A / AC 230 V IEC/EN 60 947-5-1  
NC contact: 2 A / AC 230 V IEC/EN 60 947-5-1

to DC 13  
NO contact: 2 A / DC 24 V IEC/EN 60 947-5-1  
NC contact: 2 A / DC 24 V IEC/EN 60 947-5-1

**Electrical life**

at 5 A, AC 230 V cos  $\varphi = 1$ :  $> 2.2 \times 10^5$  switching cycles

**Permissible operating frequency:**

600 switching cycles / h

**Short circuit strength**

max. fuse rating: 10 A gL IEC/EN 60 947-5-1  
line circuit breaker: B 6 A

**Mechanical life:** 10 x  $10^6$  switching cycles

## General Data

**Operating mode:**

Continuous operation

**Temperature range**

operation: - 25 ... + 55 °C

storage : - 25 ... + 85 °C

**altitude:** < 2.000 m

**Clearance and creepage distances**

rated impuls voltage / pollution degree:

**EMC**

Interference suppression

**Degree of protection**

Housing: IP 40 IEC/EN 60 529  
Terminals: IP 20 IEC/EN 60 529

**Housing:** Thermoplastic with V0 behaviour according to UL subject 94

Amplitude 0.35 mm

frequency 10 ... 55 Hz, IEC/EN 60 068-2-6

25 / 055 / 04 IEC/EN 60 068-1

EN 50 005

Plus-minus terminal screws M 3.5 box terminals with wire protection or cage clamp terminals

DIN rail IEC/EN 60 715

**Vibration resistance:**  
Weight  
LG 5924, DC 24 V: 200 g  
LG 5924, AC 230 V: 270 g

## Dimensions

**Width x height x depth**

LG 5924: 22.5 x 90 x 121 mm

LG 5924 PC: 22.5 x 111 x 121 mm

LG 5924 PS: 22.5 x 104 x 121 mm

## UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL 508, "general use applications"

**Nominal voltage  $U_N$ :** DC 24 V  
AC 110, 230 V

**Ambient temperature:** -15 ... +55°C

**Switching capacity:**

Ambient temperature 45°C: Pilot duty B300  
5A 250Vac Resistive

Ambient temperature 55°C: Pilot duty B300  
4A 250Vac Resistive

4A 24Vdc Resistive or G.P.

**Wire connection:** 60°C / 75°C copper conductors only

Screw terminals fixed: AWG 20 - 12 Sol/Str Torque 0.8 Nm

Plug in screw: AWG 20 - 14 Sol Torque 0.8 Nm

AWG 20 - 16 Str Torque 0.8 Nm

AWG 20 - 12 Sol/Str

**Info** Technical data that is not stated in the UL-Data, can be found in the technical data section.

## Standard Type

LG 5924.48/61 DC 24 V

Article number:

0061916

• Output:

3 NO, 1 NC contacts

• Nominal voltage U<sub>N</sub>:

DC 24 V

• Width:

22.5 mm

## Ordering Example

LG 5924 .48 /61 DC 24 V

Nominal voltage

UL approval

Type of terminals

without indication:

terminal blocks fixed,  
with screw terminals

PC (plug in cage clamp):  
pluggable terminal blocks  
with cage clamp terminals

PS (plug in screw):  
pluggable terminal blocks  
with screw terminals

Contacts

Type

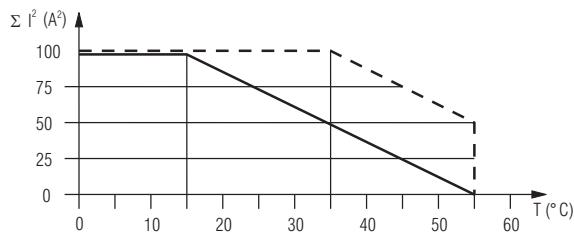

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	Power supply not connected
LED "K1/K2" does not light up	Relay K1 and K2 not energized
Device cannot be activated	- Supply voltage is not present - Defective On-button e.g. no bridge at Y1 and Y2 - K1 or K2 are welded

## Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristics

M9717\_b

device mounted away from heat generation components.

max. current at 55°C over

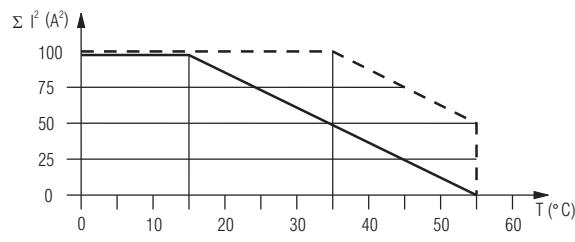

$$4 \text{ contactrows} = 3,5A \cong 4x3,5A^2 = 49A^2$$

device mounted without distance heated by devices with same load,

max current at 55°C over

$$4 \text{ contactrows} = 1A \cong 4x1^2A^2 = 4A^2$$

$$\Sigma I^2 = I_1^2 + I_2^2 + I_3^2 + I_4^2$$

 $I_1, I_2, I_3, I_4$  - current in contactrows

M9934\_a

device mounted away from heat generation components.

max. current at 55°C over

$$4 \text{ contactrows} = 3,5A \cong 4x3,5A^2 = 49A^2$$

device mounted with 5mm distance

max current at 55°C over

$$4 \text{ contactrows} = 1A \cong 4x1^2A^2 = 4A^2$$

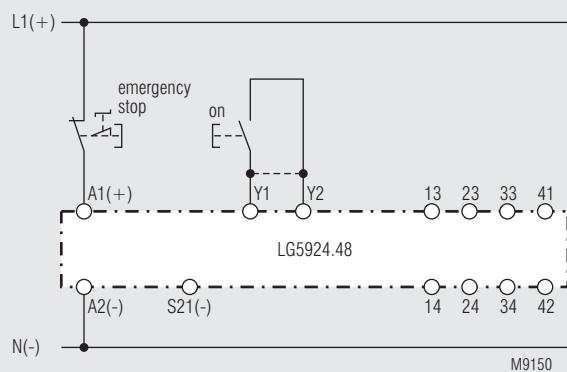

$$\Sigma I^2 = I_1^2 + I_2^2 + I_3^2 + I_4^2$$

 $I_1, I_2, I_3, I_4$  - current in contactrows

Quadratic total current limit curve LG 5924 DC 24 V

Quadratic total current limit curve LG 5924 AC 110 V, AC 230 V

## Application Examples

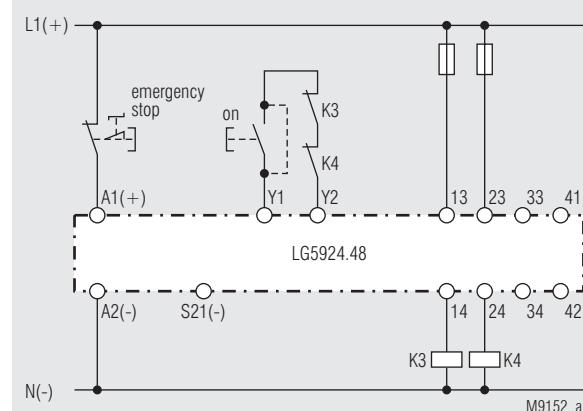

Single channel emergency-stop circuit without feed back loop, with or without automatic restart.

For automatic restart terminals Y1-Y2 must be linked.

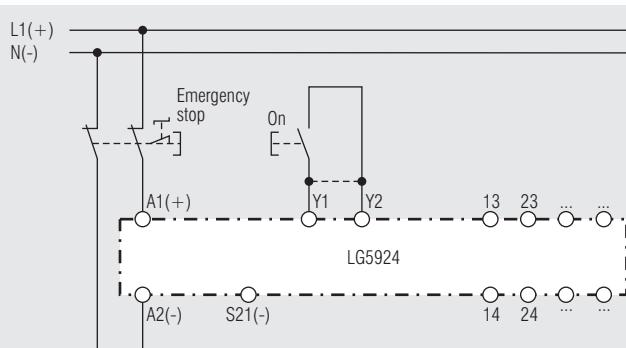

No ON-pushbutton necessary.

Suited up to SIL2, Performance Level d, Cat. 3\*

Contact reinforcement by external contactors, 2-channel controlled. For currents > 5 A the output contacts can be reinforced by external contactors. Functioning of the external contactors is monitored by looping the NC contacts into the start circuit (Y1-Y2).

Suited up to SIL2, Performance Level d, Cat. 3\*

Two-channel emergency-stop circuit without feed back loop, with or without automatic restart.

For automatic restart terminals Y1-Y2 must be linked.

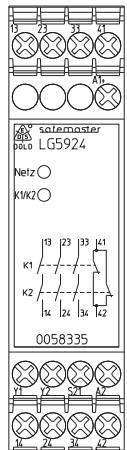

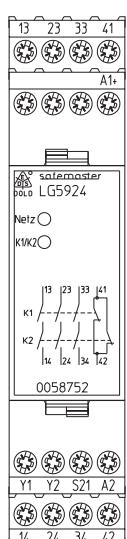

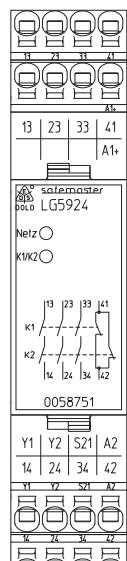

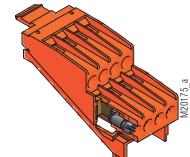

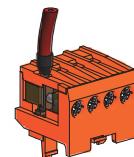

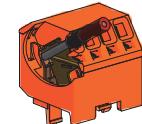

No ON-push button necessary.

Suited up to SIL3, Performance Level e, Cat. 4

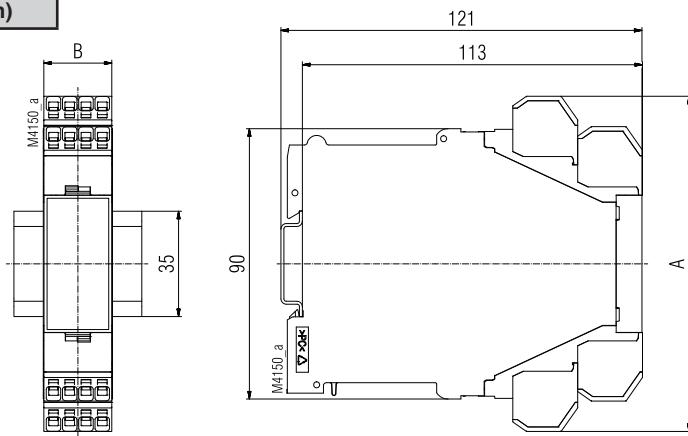

\* Suited up to SIL3, Performance Level e, Cat. 4 for E-stop systems according to IEC 60947-5-5, under the following conditions:

- A maximum number of operations for the E-stop button is observed
- The E-stop button and the E-stop module are installed in the same cabinet

## SAFEMASTER Emergency Stop Module LG 5925

**DOLD** 

0243372

### Function Diagram

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508 and IEC/EN 61511
- According to EN 50156-2 for furnaces
- Output: max. 4 NO contacts, see contacts
- LG 5925.54: 1 semiconductor output
- Single and 2-channel operation
- Line fault detection on On-button
- Manual restart or automatic restart, switch S2
- With or without cross fault monitoring in the E-stop loop, switch S1
- LG 5925.54: with cross fault monitoring in the E-stop loop
- LED indicator for state of operation
- LED indicator for channel 1 and 2
- Removable terminal strips
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled, or 2 x 2.5 mm<sup>2</sup> solid DIN 46 228-1/-2/-3/-4
- As option with pluggable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width: 22.5 mm

### Approvals and Markings

### Applications

Protection of people and machines

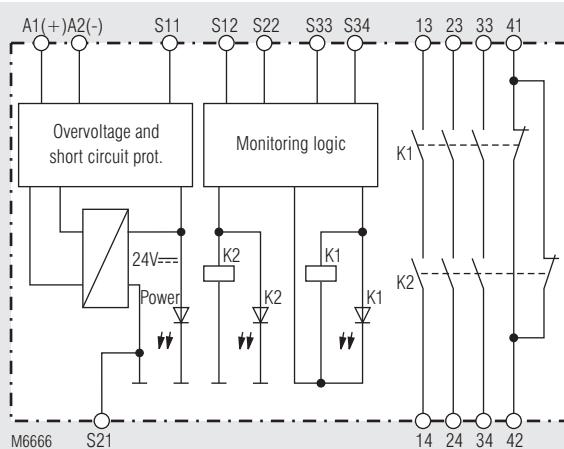

- Emergency stop circuits on machines
- Monitoring of safety gates
- Usage in furnace application in continuous operation acc. to EN 50156-1
- Safe disconnection of the complete fuel supply in furnace applications according to EN 50156-1 section 10.5.5.2

### Indicators

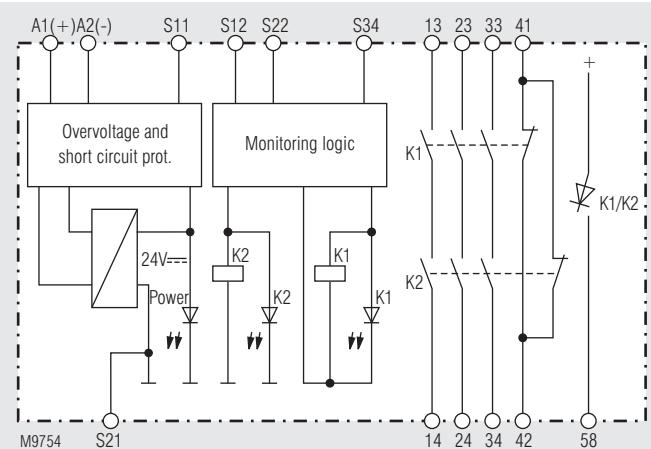

LED "Netz": on when supply connected

LED K1/K2: on when relay K1 and K2 energized

### Block Diagrams

LG 5925

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	- Power supply not connected - Cross fault between S11 and S21
LED "K1" lights up, but "K2" remains off	- Safety relay K1 is welded (replace device) - A 1-channel switch-off occurred on S12 (switch channel off on S22)
LED "K2" lights up, but "K1" remains off	- Safety relay K2 is welded (replace device) - A 1-channel switch-off occurred on S22 (switch channel off on S12)
Device cannot be activated	Manual start mode: - Line fault on start-button (disconnect power supply and remove fault) Automatic start mode: - S33-S34 not bridged - A safety relay is welded (replace device) - Incorrect setting of switch S1

## Maintenance and repairs

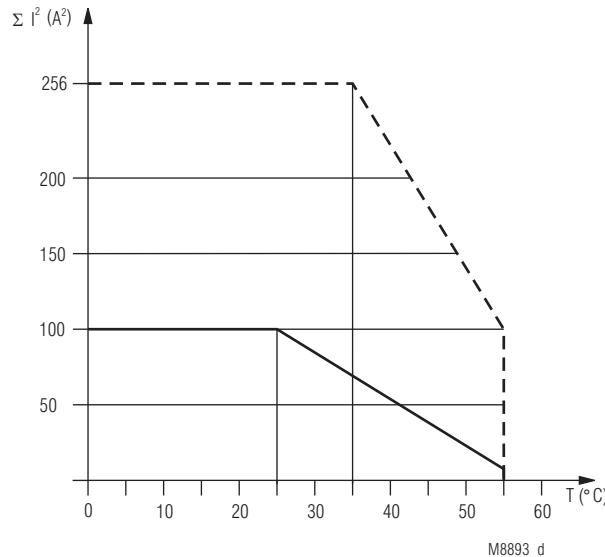

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristics

Arc limit curve under resistive load

## Characteristics

M8893\_d

device mounted away from

heat generation components.

Max. current at 55°C over

4 contact path = 5A  $\triangleq 4 \times 5^2 A^2 = 100 A^2$

device mounted without distance heated by

devices with same load,

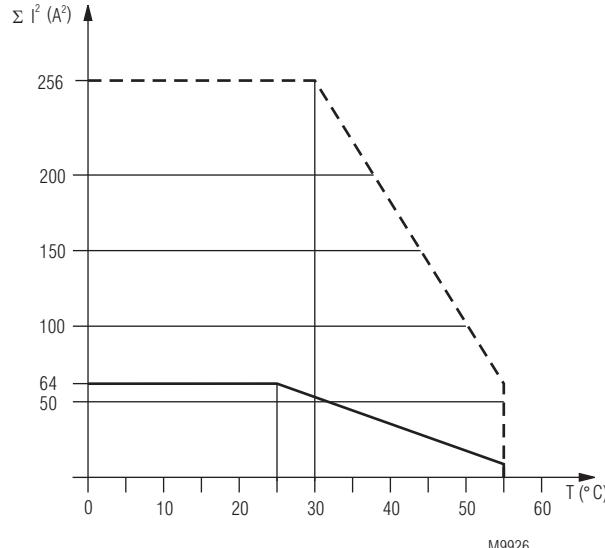

Max. current at 55°C over

4 contact path = 4A  $\triangleq 4 \times 1^2 A^2 = 4 A^2$

$$\Sigma I^2 = I_1^2 + I_2^2 + I_3^2 + I_4^2$$

$I_1, I_2, I_3, I_4$  - current in contact paths

Quadratic total current limit curve LG 5925; AC/DC 24 V

M9926

device mounted away from

heat generation components.

Max. current at 55°C over

4 contact path = 1A  $\triangleq 4 \times 1^2 A^2 = 64 A^2$

device mounted with 5mm distance

Max. current at 55°C over

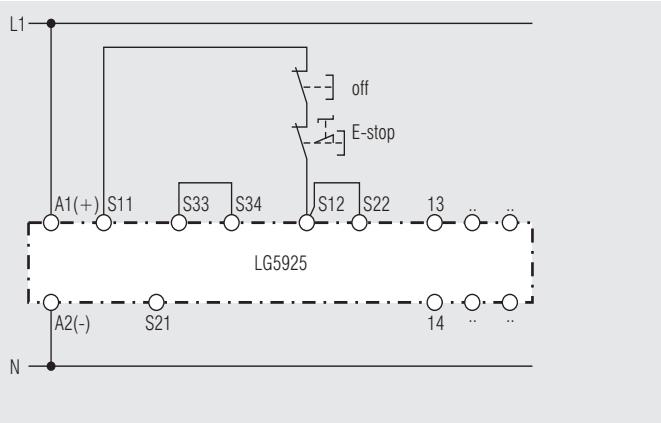

4 contact path = 1A  $\triangleq 4 \times 1^2 A^2 = 4 A^2$

$$\Sigma I^2 = I_1^2 + I_2^2 + I_3^2 + I_4^2$$

$I_1, I_2, I_3, I_4$  - current in contact paths

Quadratic total current limit curve LG 5925; AC 110 ... 115 V, AC 230 V

## Application Examples

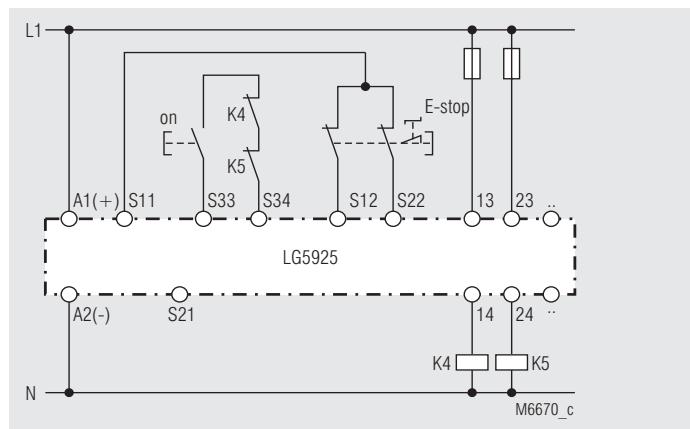

Single channel emergency stop circuit. This circuit does not have any redundancy in the emergency-stop control circuit.

**Note: Refer to "Unit programming"!**

Switches in pos.: S1 no cross fault detection  
S2 automatic start

Suited up to SIL2, Performance Level d, Cat. 3

Contact reinforcement by external contactors, 2-channel controlled.

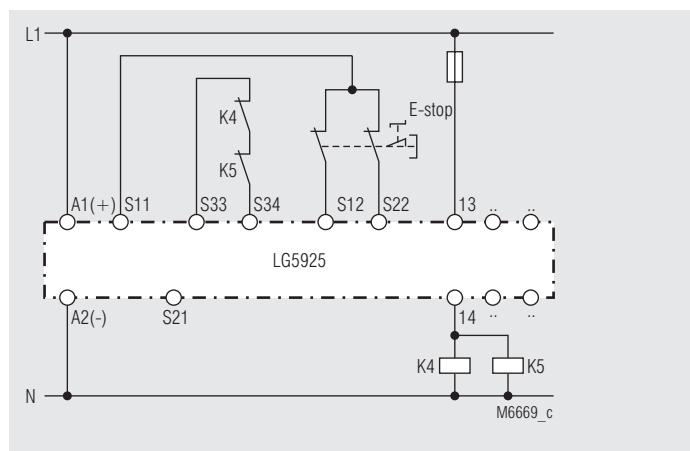

The output contacts can be reinforced by external contactors with forcibly guided contacts for switching currents > 8 A.

Functioning of the external contactors is monitored by looping the NC contacts into the closing circuit (terminals S33-S34).

**Note: Refer to "Unit programming"!**

Switches in pos.: S1 no cross fault detection  
S2 manual start

Suited up to SIL3, Performance Level e, Cat. 4

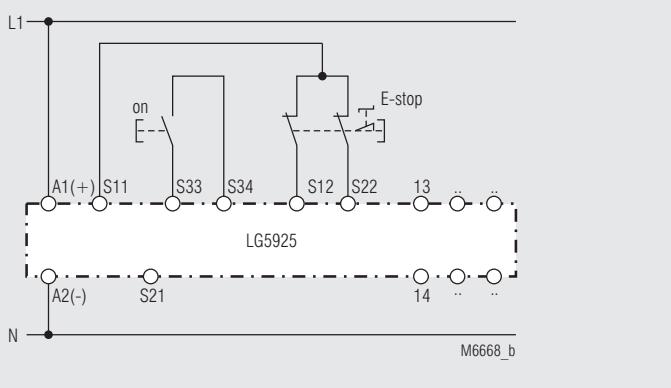

Contact reinforcement by external contactors controlled by one contact path.

**Note: Refer to "Unit programming"!**

Switches in pos.: S1 no cross fault detection  
S2 automatic start

Suited up to SIL3, Performance Level e, Cat. 4

## Application Examples

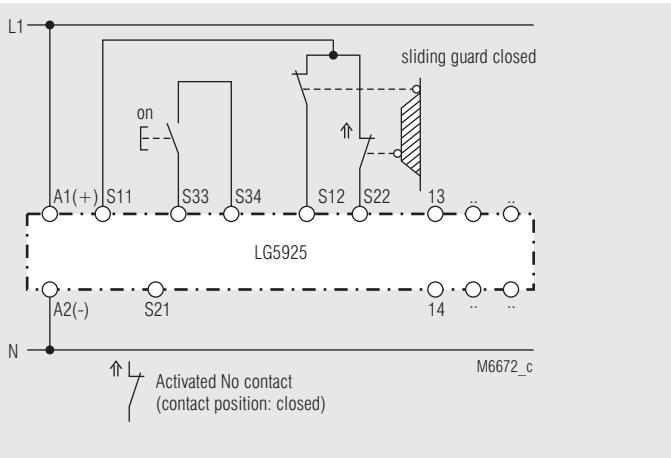

2-channel emergency stop circuit without cross fault monitoring.

**Note: Refer to "Unit programming"!**

Switches in pos.: S1 no cross fault detection  
S2 manual start

Suited up to SIL3, Performance Level e, Cat. 4

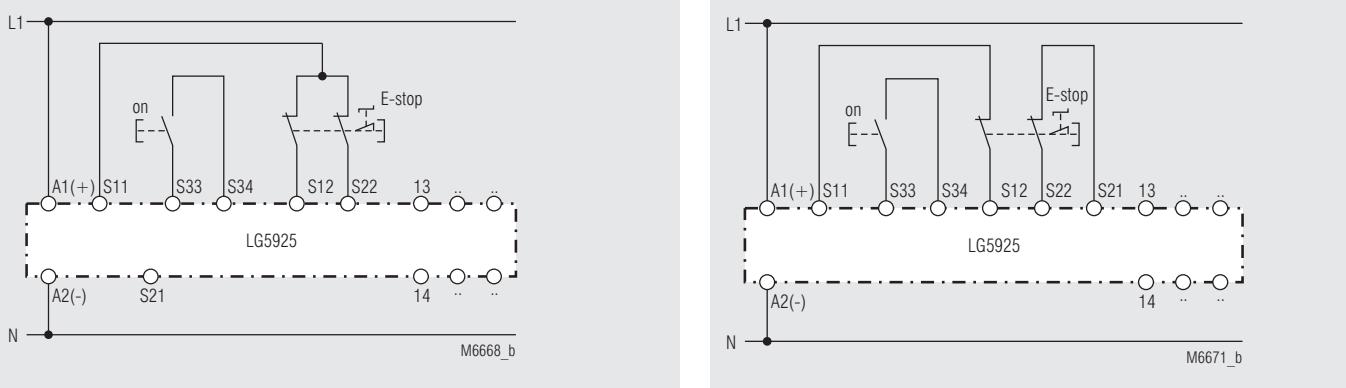

2-channel safety gate monitoring.

**Note: Refer to "Unit programming"!**

Switches in pos.: S1 no cross fault detection  
S2 manual start

Suited up to SIL3, Performance Level e, Cat. 4

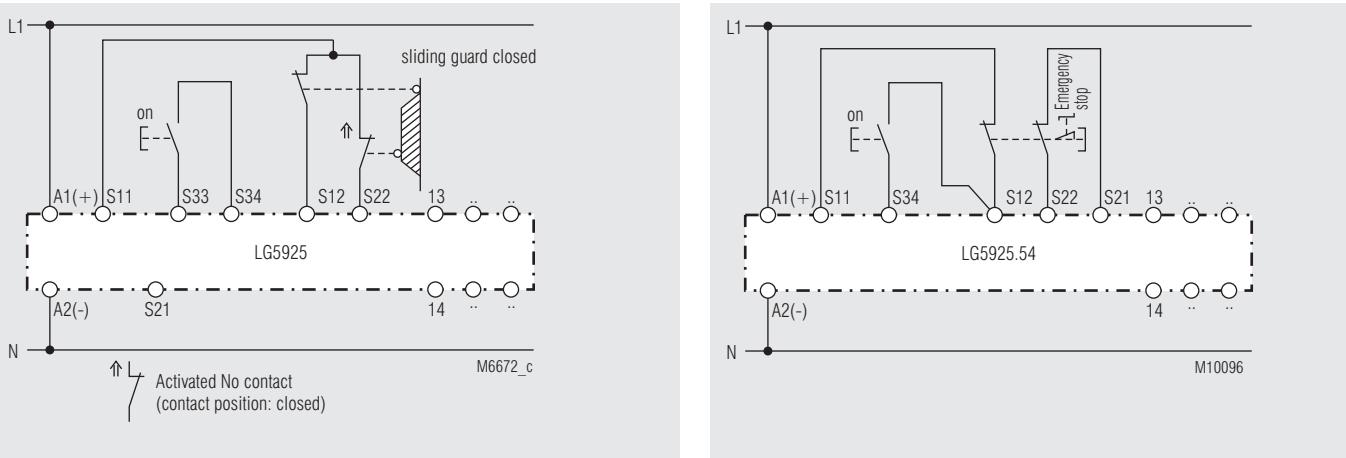

2-channel emergency stop circuit with cross fault detection

**Note: Refer to "Unit programming"!**

Switches in pos.: S1 cross fault detection  
S2 manual start

Suited up to SIL3, Performance Level e, Cat. 4

2-channel emergency stop circuit with cross fault detection

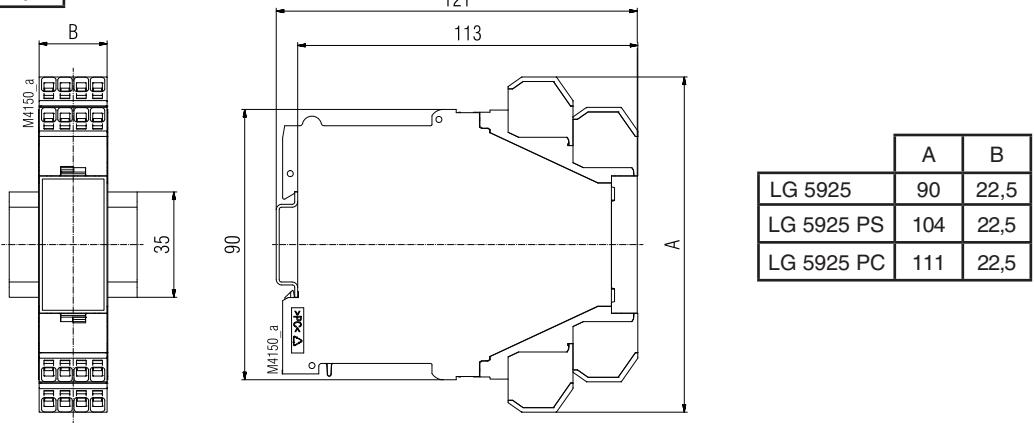

**Note: Refer to "Unit programming"!**

Switches in pos.: S2 manual start  
Suited up to SIL3, Performance Level e, Cat. 4

# Safety Technique

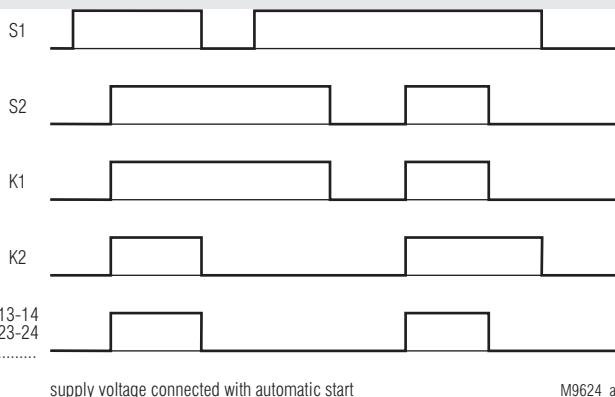

## SAFEMASTER Safety Module for Elevator Controls LG 5925.03/034

**DOLD** 

0269441

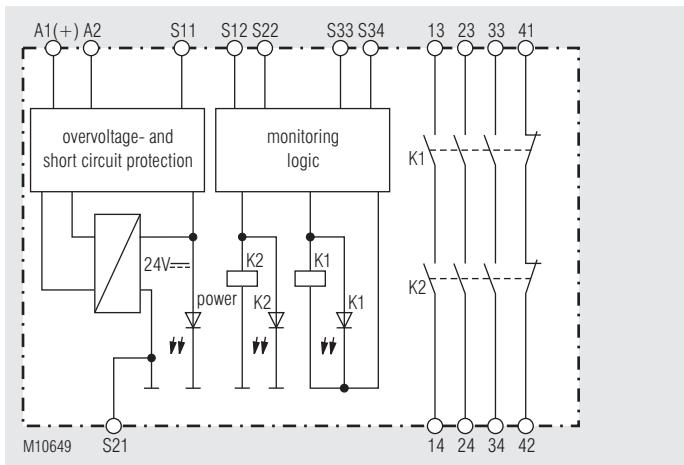

### Function Diagram

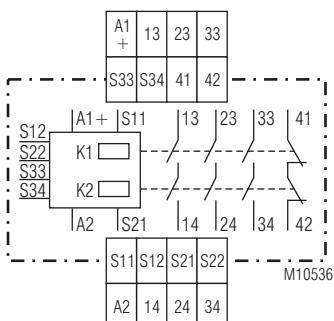

M9624\_a

### Block Diagram

### Circuit Diagram

### Your Advantages

- For elevators according to EN 81-20/-50

### Features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508
  - Directive 2014/33/EU for elevators
- Output: 3 NO contacts, 1 NC contact
- Single or 2-channel operation
- Line fault detection on On-button
- Manual restart or automatic restart, switch S2
- With or without cross fault monitoring in the loop, switch S1
- LED indicator for state of operation
- LED indicator for channel 1 and 2
- Degree of protection IP40; can be mounted in cabinets and installations with lower degree of protection without additional measures (depending on ambient conditions)
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled (isolated), DIN 46 228-1/-2/-3/-4 or 2 x 2.5 mm<sup>2</sup> stranded ferruled DIN 46 228-1/-2/-3
- As option with pluggable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width 22.5 mm

### Approvals and Markings

### Applications

Bridging of the door and locking switches while moving the elevator in the unlocking zone with open doors according to EN81-20/-50 for elevators for people and loads.

### Indicators

LED Netz:  
on when supply connected  
LED K1/K2:  
on when relay K1 and K2 energized

### Connection Terminals

Terminal designation	Signal description
A1+	+ / L
A2	- / N
S12, S22, S33, S34	Inputs
S11, S21	Outputs
13, 14, 23, 24, 33, 34	Positive driven NO contacts for release circuit
41, 42	Positive guided indicator output

## Notes

Line fault detection on On-button:

The line fault detection is only active when S12 and S22 are switched simultaneously. If The On-button is closed before S12, S22 is connected to voltage (also when line fault across On-Button), the output contacts will not close. A line fault across the On-button which occurred after activation of the relay, will be detected with the next activation and the output contacts will not close.

The terminal S21 permits the operation of the device in IT-systems with insulation monitoring, serves as a reference point for testing the control voltage and is used to connect the loop when cross fault monitoring is selected.

Connecting the terminal S21 to the protective ground bridges the internal short-circuit protection of Line A2 (-). The short-circuit protection of line A1 (+) remains active.

To alter the functions automatic start - manual start and with or without cross fault monitoring, the switches S1 and S2 are used. These are located behind the front cover (see unit programming).

The setting with or without cross fault monitoring is made with S1.

Switch S2 is used to select automatic or manual restart. Additionally, for the function "automatic restart", terminals S33 and S34 have to be bridged. Connect the device according to application examples.

## Technical Data

### Input circuit

#### Nominal Voltage $U_N$ :

LG 5925: AC/DC 24 V

#### Voltage range:

0.9 ... 1.1  $U_N$

#### Nominal consumption at $U_N$ :

DC ca. 1.5 W

#### Min. Off-time:

250 ms

#### Control voltage on S11 at $U_N$ :

DC 22 V

#### Control current typ. over

#### S12, S22

30 mA at  $U_N$

#### Min. voltage on S12, S22

DC 20 V

#### when relay activated

Internal PTC

#### Short-circuit protection:

Internal VDR

### Output

#### Contacts:

3 NO, 1 NC contact

The NO contacts are safety contacts.

**The NC contacts 41-42 can only be used for monitoring.**

#### Operate delay typ. at $U_N$ :

Manual start: 30 ms

Automatic start: 350 ms

#### Release delay typ. at $U_N$ :

Disconnecting the supply: typ. 20 ms

Disconnecting S12, S22: typ. 15 ms

#### Contact type:

forcibly guided

#### Nominal output voltage:

AC 250 V

DC see limit curve for arc-free operation

max. 5 A per contact

(see quadratic total current limit curve)

#### Thermal current $I_{th}$ :

#### Switching capacity

to AC 15:

NO contacts: 3 A / AC 230 V IEC/EN 60 947-5-1

NC contacts: 2 A / AC 230 V IEC/EN 60 947-5-1

to DC 13:

NO contacts: 2 A / DC 24 V IEC/EN 60 947-5-1

NC contacts: 2 A / DC 24 V IEC/EN 60 947-5-1

#### Electrical contact life

to 5 A, AC 230 V cos  $\varphi = 1$ :  $> 2.2 \times 10^5$  switching cycles

#### Permissible operating frequency:

max. 1 200 operating cycles / h

#### Short circuit strength

max. fuse rating: 10 A gL

IEC/EN 60 947-5-1

line circuit breaker: B 6 A

**Mechanical life:**  $> 20 \times 10^6$  switching cycles

## Technical Data

### General Data

#### Operating mode:

Continuous operation

#### Temperature range

operation: - 15 ... + 55 °C

storage : - 40 ... + 85 °C

#### Altitude:

< 2.000 m

#### Clearance and creepage distances

Rated impuls voltage / pollution degree:

#### EMC

Interference suppression:

#### Degree of protection

Housing:

IEC/EN 60 529

Terminals:

IEC/EN 60 529

#### Housing:

Thermoplastic with V0 behaviour

according to UL subject 94

Amplitude 0.35 mm IEC/EN 60 068-2-6

frequency 10 ... 55 Hz

15 / 055 / 04

IEC/EN 60 068-1

EN 50 005

Plus-minus terminal screws M 3.5  
box terminals with wire protection or  
cage clamp terminals

DIN rail

IEC/EN 60 715

210 g

### Dimensions

#### Width x height x depth

LG 5925: 22.5 x 90 x 121 mm

LG 5925 PC: 22.5 x 111 x 121 mm

LG 5925 PS: 22.5 x 104 x 121 mm

### Standard Type

#### LG 5925.03/034 AC / DC 24 V

Article number: 0064797

• Output: 3 Schließer, 1 Öffner

• Nominal voltage  $U_N$ : AC/DC 24 V

• Width: 22,5 mm

## Ordering Example

LG 5925.03 /034 AC / DC 24 V

Nominal voltage  
Type of terminals without indication:  
terminal blocks fixed with screw terminals  
PC (plug in cage clamp):  
pluggable terminal blocks with cage clamp terminals  
PS (plug in screw):  
pluggable terminal blocks with screw terminals  
Contacts  
Type

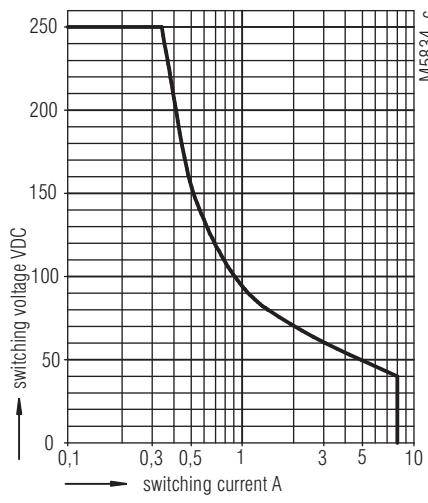

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	- Power supply not connected - Cross fault between S11 and S21
LED "K1" lights up, but "K2" remains off	- Safety relay K1 is welded (replace device) - A 1-channel switch-off occurred on S12 (switch channel off on S22)
LED "K2" lights up, but "K1" remains off	- Safety relay K2 is welded (replace device) - A 1-channel switch-off occurred on S22 (switch channel off on S12)
Device cannot be activated	Manual start mode: - Line fault on start-button (disconnect power supply and remove fault) Automatic start mode: - S33-S34 not bridged - A safety relay is welded (replace device) - Incorrect setting of switch S1

## Maintenance and Repairs

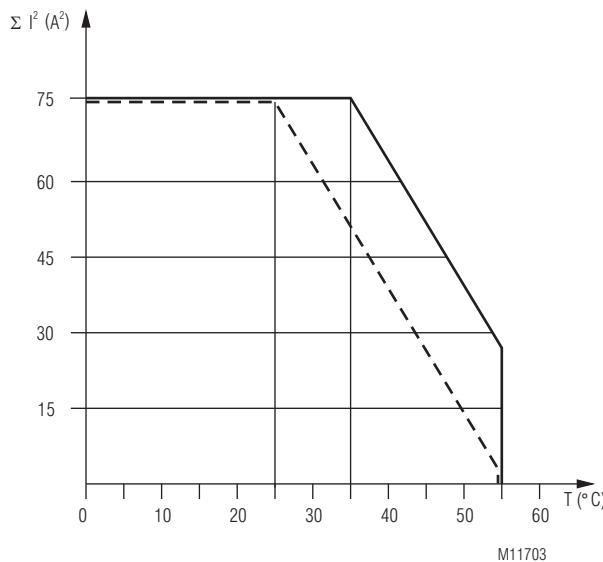

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristics

safe breaking, no continuous arcing,  
max. 1 switching cycle / s

Arc limit curve under resistive load

device mounted away from heat generation components.

max. current at 55°C over 3 contact path =  $3A \triangleq 3x3^2A^2 = 27A^2$

device mounted without distance heated by devices with same load.

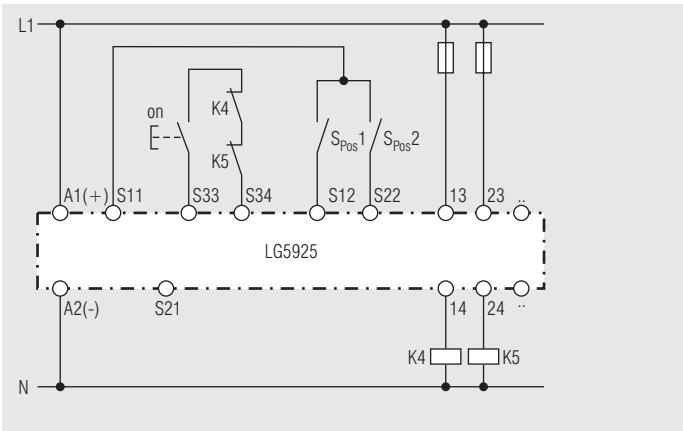

max. current at 55°C over 3 contact path =  $1A \triangleq 3x1^2A^2 = 3A^2$

$$\Sigma I^2 = I_1^2 + I_2^2 + I_3^2$$

$I_1, I_2, I_3$  - current in contact paths

Quadratic total current limit curve

## Application Examples

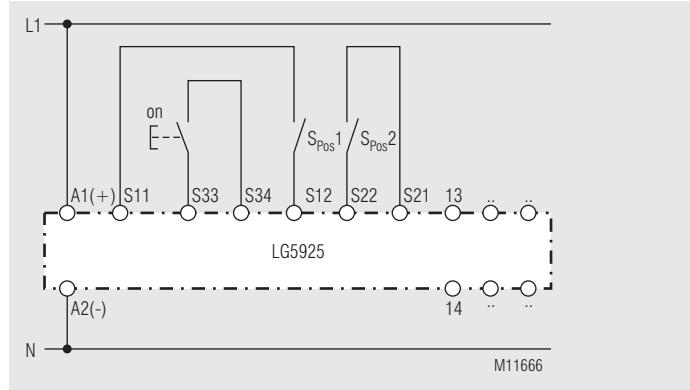

Contact reinforcement by external contactors, 2-channel controlled.  
Functioning of the external contactors is monitored by looping the NC contacts into the closing circuit (terminals S33-S34).

**Note: Refer to "Unit programming"!**

Switches in pos.: S1 no cross fault detection

S2 manual start

Suited up to SIL3, Performance Level e, Cat. 4

2-channel circuit with cross fault detection

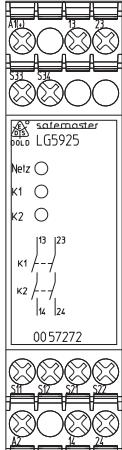

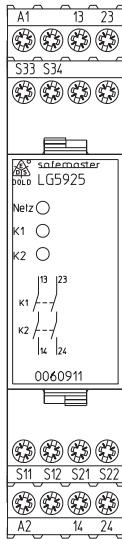

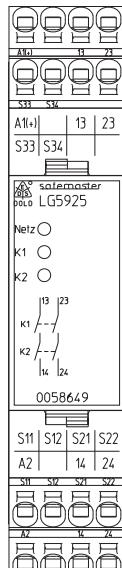

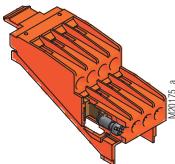

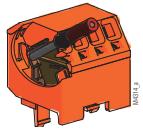

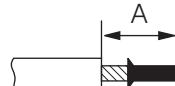

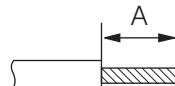

**Note: Refer to "Unit programming"!**

Switches in pos.: S1 cross fault detection

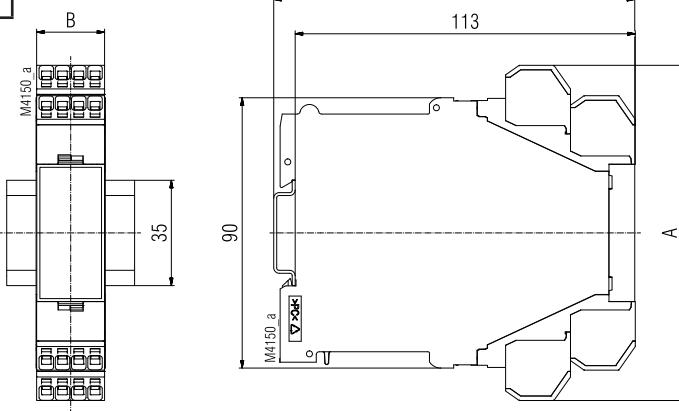

S2 manual start

Suited up to SIL3, Performance Level e, Cat. 4

## SAFEMASTER Emergency Stop Module With Time Delay LG 5928

**DOLD** 

0258918

### Function Diagram

### Your advantage

- Compact, flexible and safe
- Short response time
- Ideal for designs according to the new safety standards

### Features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508 and IEC/EN 61511
- Output: 2 NO instantaneous contacts and 1 release delay contact
- 1- or 2-channel connection
- Line fault detection at the ON pushbuttons at connection on terminals S33-S34
- Manual restart with button on S33-S34 or automatic restart with bridge between S13-S34
- With or without cross fault monitoring in the E-stop loop
- Indication for released time circuit
- LED indication for supply, channel 1/2 and release delayed contacts
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled (isolated), DIN 46 228-1/-2/-3/-4 or 2 x 2.5 mm<sup>2</sup> stranded ferruled DIN 46 228-1/-2/-3
- As option with pluggable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width 22.5 mm

### Approvals and Markings

Canada / USA A025518

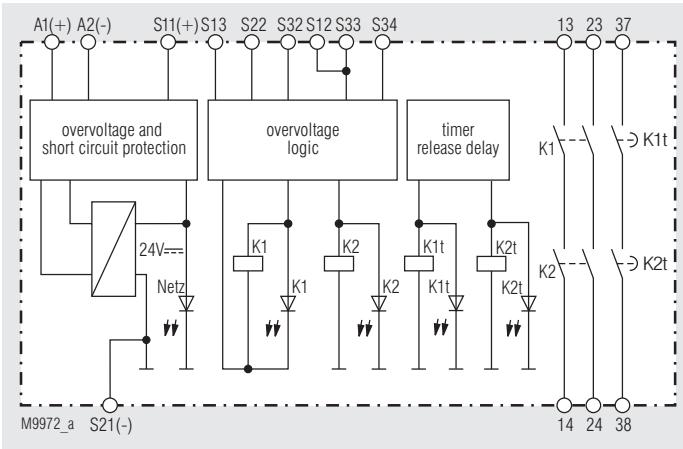

\*) see variants

### Application

Protection of people and machines

- Emergency stop circuits on machines, Stop category 1 can be realised
- Monitoring of safety gates

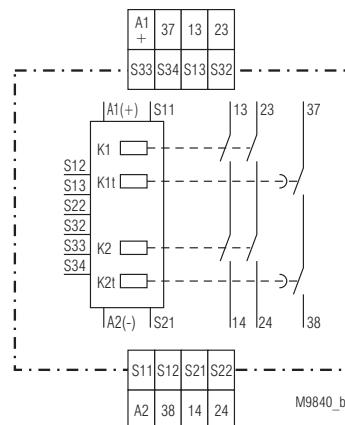

### Block Diagram

### Indicators

upper LED: on when supply connected  
lower LEDs: on, when relay K1 and K2 resp. K1<sub>t</sub> and K2<sub>t</sub> energized

### Circuit Diagram

LG 5928.41

## Connection Terminals

Terminal designation	Signal description
A1(+)	+ / L
A2 (-)	- / N
S11, S21, S13, S33	Inputs
S12, S22, S32, S34	Outputs
13, 14, 23, 24	Positive driven NO contacts for release circuit
37, 38	Positive guided No contacts for release delay circuit

## Notes

To select automatic restart terminals S13 - S34 must be bridged, S33 - S34 must be opened. Open terminals S13 - S34 select manual restart, the On-button must then be connected to S33 - S34.

Line fault detection on On-button:

The line fault detection is only active when the time delayed relais K1<sub>t</sub> and K2<sub>t</sub> have released and then S12 (channel A) and S32 (channel B) are switched simultaneously. If the On-button is closed before S12, S32 is connected to voltage (also when line fault across On-button), the output contacts will not close. The unit will not restart before the time delay is finished.

A line fault across the On-button which occurred after activation of the relay, will be detected with the next activation and the output contacts will not close. If a line fault occurs after the voltage has been connected to S12, S32, the unit will be activated because this line fault is similar to the normal On-function.

The unit can be operated with single channel and 2-channel operation with cross fault monitoring. For connection please refer to application examples.

The terminal S21 permits the operation of the device in IT-systems with insulation monitoring, serves as a reference point for testing the control voltage and is used to connect the E-stop loop when cross fault monitoring is selected.

Connecting the terminal S21 to the protective ground bridges the internal short-circuit protection of Line A2(-). The short-circuit protection of line A1(+) remains active.

## Technical Data

**Time delay tv**  
(release delayed):

Auxiliary supply must be connected for time delay

Time ranges:

0.1 ... 1 s	3.0 ... 30 s

## Technical Data

### Input

<b>Nominal voltage U<sub>N</sub>:</b>	DC 24 V
<b>Voltage range:</b>	0.9 ... 1.1 U <sub>N</sub>
<b>Nominal consumption:</b>	approx. 3.5 W
<b>Min. Off-time:</b>	1 s
<b>Control voltage S11:</b>	DC 23 V at U <sub>N</sub> device not activated
<b>Control current via S12, S32:</b>	each 40 mA at U <sub>N</sub>
<b>Min. voltage to terminals S12, S32:</b>	DC 19 V device not activated
<b>Short-circuit protection:</b>	Internal PTC
<b>Oversupply protection:</b>	Internal VDR

### Output

<b>Contacts:</b>	2 NO contacts instantaneous, and 1 contact release delay
<b>Operating time typ. at U<sub>N</sub>:</b>	
manual start:	25 ms
automatic start at U <sub>N</sub> :	100 ms
<b>Release delay typ. at U<sub>N</sub>:</b>	
in case of break of supply voltage:	20 ms
in case of break of S12, S22 and S32:	10 ms

## UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL 508, "general use applications"

**Nominal voltage  $U_N$ :** DC 24 V

**Ambient temperature:** -15 ... +55°C

### Switching capacity:

Ambient temperature 45°C Contact 13/14 and 23/24:  
Pilot duty R300  
6A 250Vac Resistive  
6A 24Vdc Resistive or G.P.  
Contact 37/38:  
8A 250Vac Resistive  
8A 24Vdc Resistive or G.P.

Ambient temperature 55°C: Contact 13/14 and 23/24:  
Pilot duty R300  
5A 250Vac Resistive  
5A 24Vdc Resistive or G.P.  
Contact 37/38:  
7A 250Vac Resistive  
7A 24Vdc Resistive or G.P.

**Wire connection:**  
Screw terminals fixed: 60°C / 75°C copper conductors only  
AWG 20 - 12 Sol/Str Torque 0.8 Nm  
Plug in screw: AWG 20 - 14 Sol Torque 0.8 Nm  
AWG 20 - 16 Str Torque 0.8 Nm  
Plug in cage clamp: AWG 20 - 12 Sol/Str

 Technical data that is not stated in the UL-Data, can be found in the technical data section.

## Standard Type

LG 5928.41/61 DC 24 V 1 ... 10 s

Article number: 0061683

- Output: 2 NO contacts instantaneous and
- 1 NO contacts release delayed
- Nominal voltage  $U_N$ : DC 24 V
- Time delay  $t_v$ : 1 ... 10 s
- Width: 22.5 mm

## Variants

LG 5928.41/61:

with redundant time circuits to disconnect K1t and K2t, adjustable time. Each time circuit operates one output relay

LG 5928.41/001/61:

as LG 5928.41/61, but with fixed time delay  
Fixed times: 1 s, 3 s, 5 s, 10 s, 300 s  
other values on request

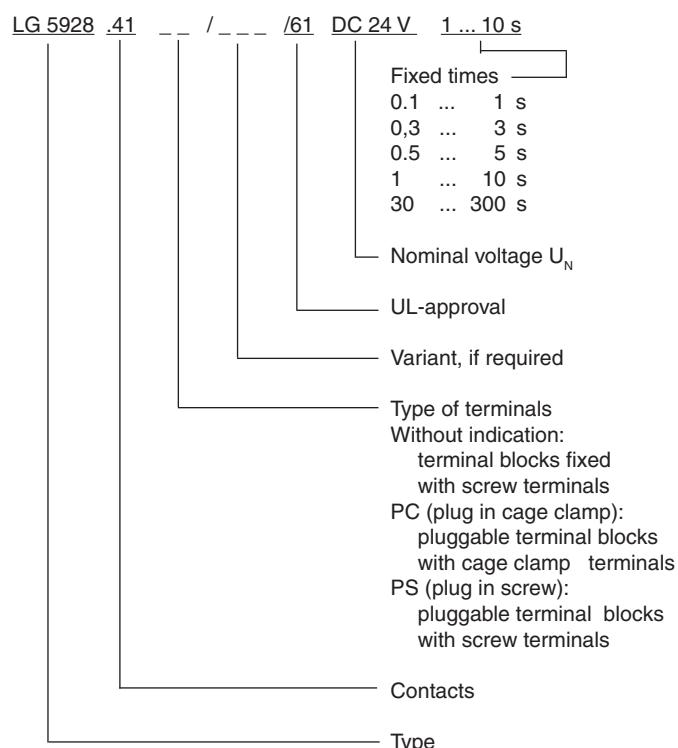

LG 5928.41/100/61:

as LG 5928.41/61, but deactivation of the first time relay deactivates the second time relay i. e. both relays switch off simultaneously

LG 5928.41/101/61:

as LG 5928.41/100/61, but with fix time delay  
Fixed times: 1 s, 3 s, 5 s, 10 s, 300 s  
other times on request

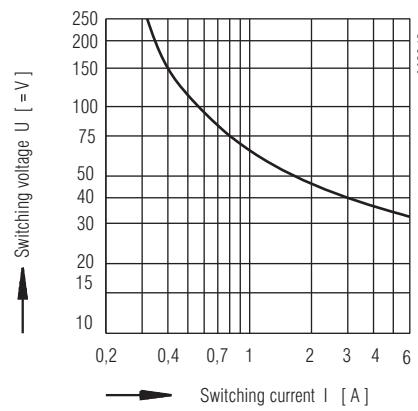

### Ordering example for variants:

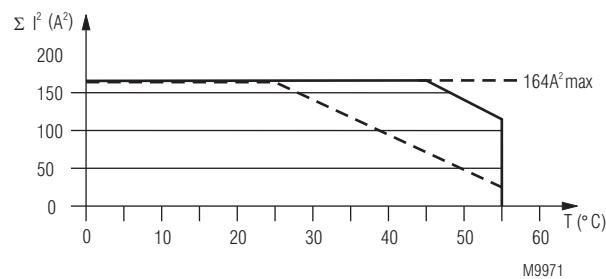

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	Power supply A1/A2 not connected
LED "K1" lights up, but "K2" remains off	- Safety relay K1 is welded (replace device) - A 1-channel switch-off occurred on S12 (switch channel off on S22 e. g. S32)
LED "K2" lights up, but "K1" remains off	- Safety relay K2 is welded (replace device)) - A 1-channel switch-off occurred on S22 e. g. S32 (switch channel off on S12)
Device cannot be activated	- The delayed contacts are not yet switched off - Safety relay is welded (replace device) - Min. one of this connection is not present (S11-S12, S11-S32, S21-S22) Manual start mode: - Line fault on start-button (disconnect power supply and remove fault) - Automatic start mode: S13-S34 are not bridged

## Characteristics

Limit curve for arc-free operation

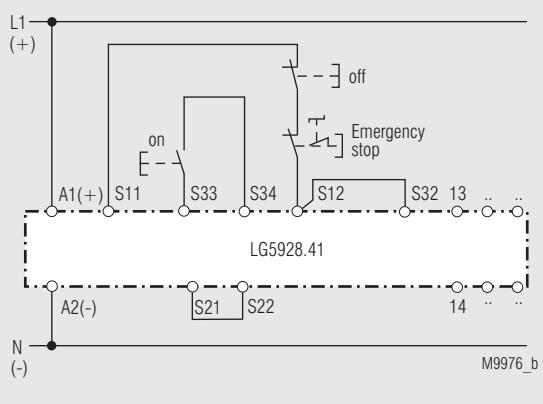

$$\Sigma I^2 = I_1^2 + I_2^2 + I_3^2$$

$I_1, I_2, I_3$  - current in contactrows

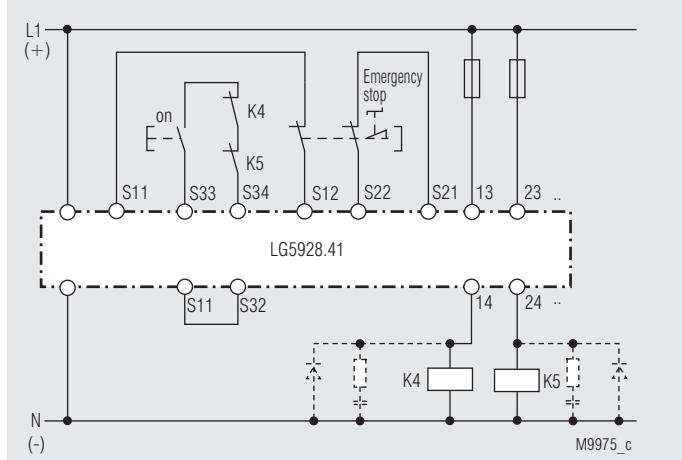

Quadratic total current limit curve

## Application Examples

Single channel emergency stop circuit. This circuit does not have any redundancy in the emergency-stop control circuit.

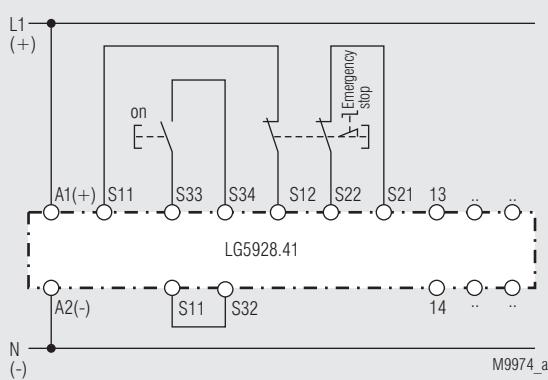

Suited up to SIL2, Performance Level d, Cat. 3

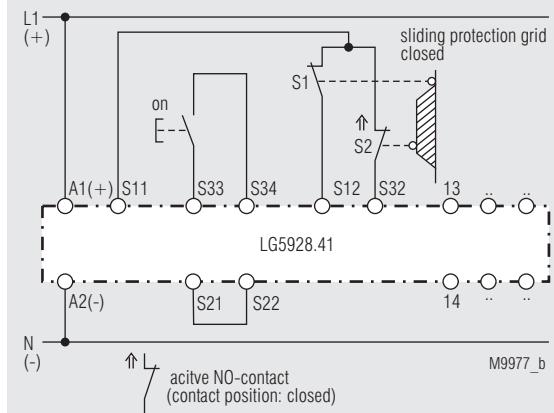

Contact reinforcement by external contactors, 2-channel controlled. The output contacts can be reinforced by external contactors with forcibly guided contacts for switching currents > 8 A e.g. 6 A.

Functioning of the external contactors is monitored by looping the NC contacts into the closing circuit (terminals S13-S34 or S33-S34).

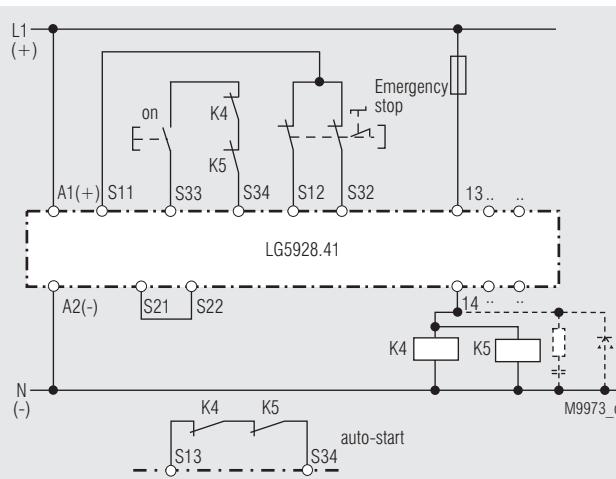

Suited up to SIL3, Performance Level e, Cat. 4

2-channel emergency stop circuit with cross fault monitoring.  
Suited up to SIL3, Performance Level e, Cat. 4

2-channel safety gate monitoring.  
Suited up to SIL3, Performance Level e, Cat. 4

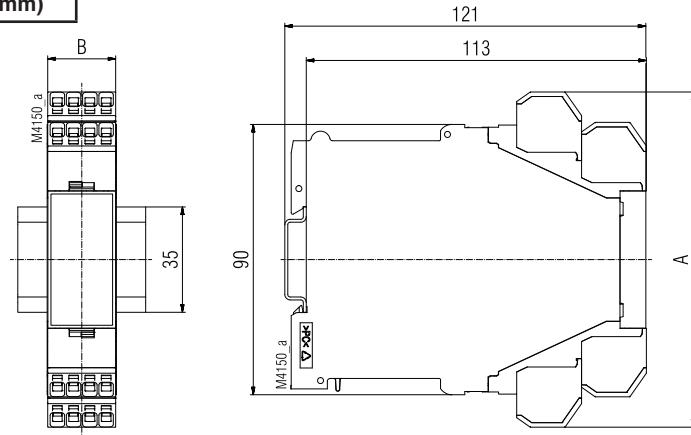

Contact reinforcement by external contactors controlled by one contact path. S33 - S34 must stay open on auto start.  
Suited up to SIL3, Performance Level e, Cat 4, if the external contactors are in the same cabinet and the wiring is short circuit and crossfault prove.

## SAFEMASTER Emergency Stop Module BD 5935

**DOLD** 

0221548

### Product Description

The BD 5935 is used to interrupt a safety circuit in a safe way. It can be used to protect people and machines in applications with e-stop buttons and safety gates.

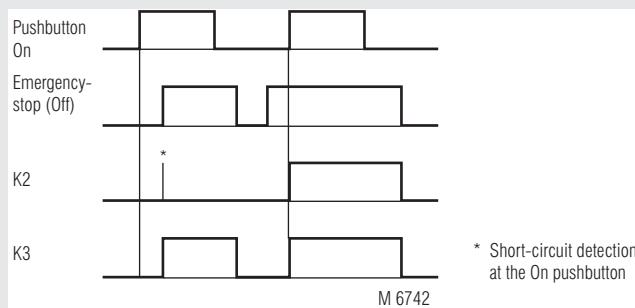

### Your Advantages

- Safe disconnection of electrical circuits
- Line fault detection on ON pushbutton
- Gold plated contacts to switch low loads (signal to PLC)
- Optionally cross fault detection in emergency stop circuit
- Easy exchange of devices by removable terminal strips

### Features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL 3) to IEC/EN 61508
- 1- or 2-channel connection
- Operating state display
- LED display for channels 1 and 2
- Overtoltage and short circuit protection
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled (isolated), DIN 46 228-1/-2/-3/-4 or 2 x 2.5 mm<sup>2</sup> stranded ferruled DIN 46 228-1/-2/-3
- Output: optionally 1 NO / 1 NC or 3 NO / 1 NC contacts
- Optionally automatic ON function or activation via the ON pushbutton
- With fast auto start as option
- Width 45 mm

### Function Diagram

### Approvals and Markings

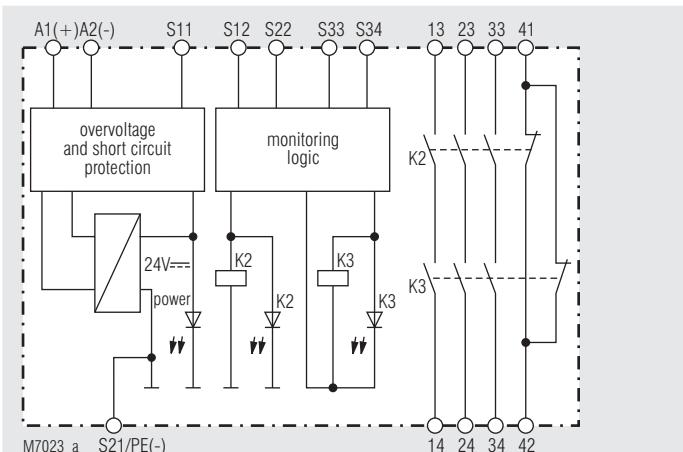

\* see variants

### Applications

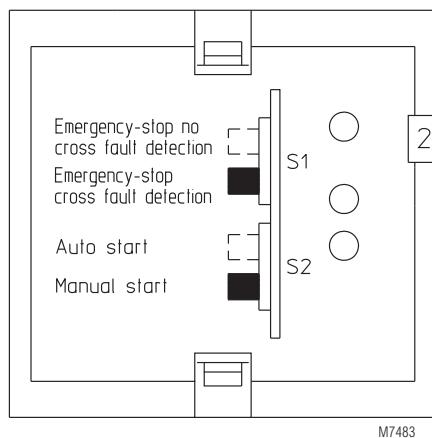

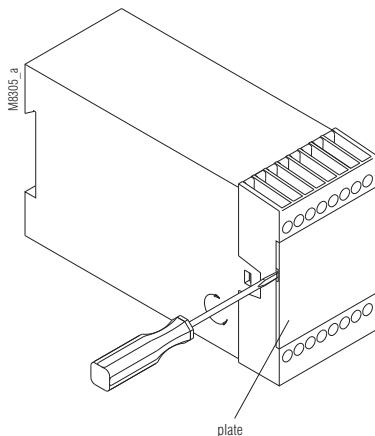

- Protection of persons and machines
- Emergency-stop circuits on machines
  - Monitoring of safety gates

### Block Diagram

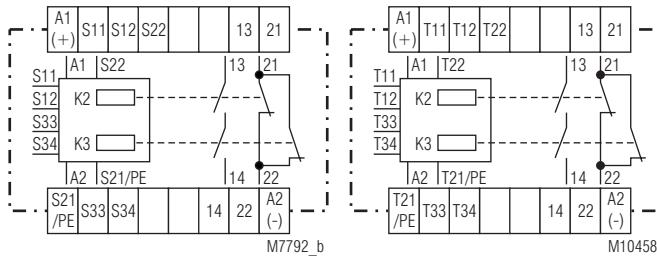

### Indication

- upper LED: on when supply voltage connected  
lower LEDs: on when relay K2 and K3 active

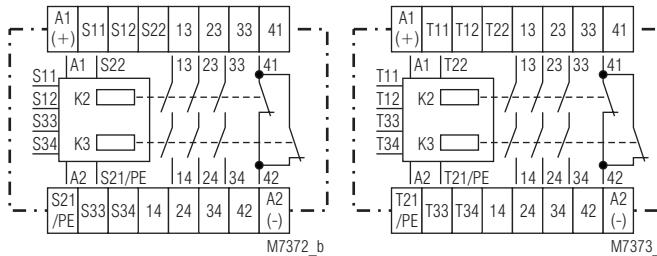

### Circuit Diagrams

BD 5935.48/200

BD 5935.52

### Connection Terminals

Terminal designation	Signal description
A1(+)	+ / L
A2 (-)	- / N
S12, S22, S33, S34, T12, T22, T33, T34	Inputs
S11, S21/PE, T11, T21/PE,	Outputs
13, 14, 23, 24, 33, 34	Forcibly guided NO contacts for release circuit
21, 22, 31, 32, 41, 42	Forcibly guided indicator output

### Notes

If the ON pushbutton was already closed before the voltage was applied at S12, S22 (also in the case of line fault via the ON pushbutton), the output contacts cannot be switched on.

A line fault at the ON pushbutton which occurred after activation of the unit is recognized when switching on takes place again and switching-on of the output contacts is prevented. If a line fault occurs at the ON pushbutton after the voltage has already been applied at S12 and S22, unwanted activation occurs because this line fault can not be distinguished from the regular switching-on function. The PE testing terminal allows the units to be also operated in IT networks with insulation monitoring. It also serves as a reference point for checking the control voltage and as a connection contact in the event of an emergency-stop with cross fault detection.

Because of the gold-plated contacts the BD 5935 can be used to switch small loads 1 mVA ... 7 VA, 1 mW ... 7 W in the range of 0.1 ... 60 V, 1 ... 300 mA. The gold-plated contacts allow also to switch the maximum current but the gold plating will be burnt off. After that the contacts cannot be used any more to switch the small loads.

One or more extension modules BN 3081 or external contactors with forcibly guided contacts can be used to multiply the number of contacts of the emergency-stop module BD 5935.

The switches S1 and S2 are provided for the following selection possibilities: Automatic-start, manual-start and emergency-stop with or without cross fault detection. These switches are located behind the front cover panel (see unit programming diagrams).

Switch S2 is for selecting automatic or manual Start. In addition, terminals S33 and S34 must be jumpered for "automatic start function".

Selection of the operating mode with or without cross fault detection at the emergency-stop pushbutton is performed via the switch S1. The unit must be connected as shown in the application example.

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	- Power supply not connected - Cross fault between S11 and S21
LED "K2" lights up, but "K3" remains off	- Safety relay K2 is welded (replace device) - A 1-channel switch-off occurred on S22 (switch channel off on S12)
LED "K3" lights up, but "K2" remains off	- Safety relay K3 is welded (replace device) - A 1-channel switch-off occurred on S12 (switch channel off on S22)
Device cannot be activated	Manual start mode - Line fault on start-button (disconnect power supply and remove fault) Automatic start mode: - S33-S34 are not bridged - Safety relay is welded (replace device) - Incorrect setting of switch S1

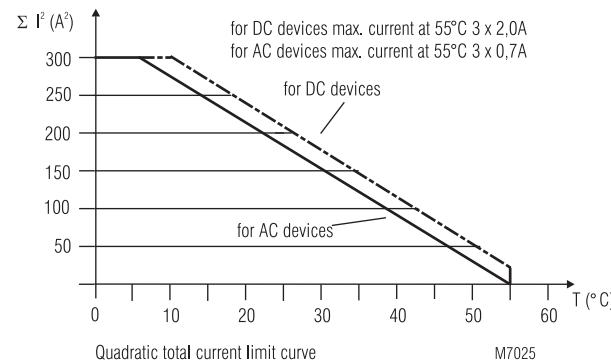

## Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristics

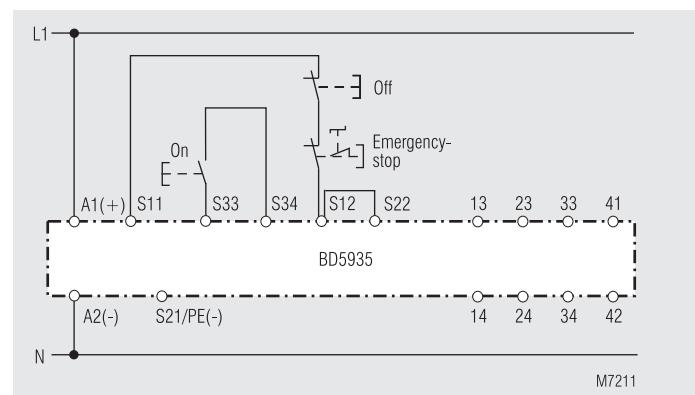

Arc limit curve under resistive load

Quadratic total current limit curve

## Application Example

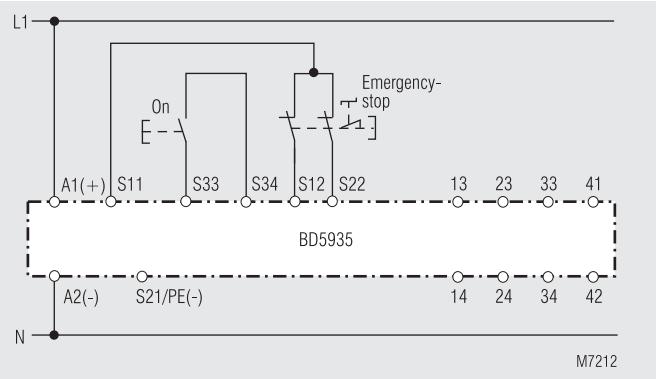

Single-channel emergency-stop circuit. This circuit has no redundancy in the emergency-stop control circuit.

**Please note "Unit programming" !**

Switches in pos.:      S1 no cross fault detection  
                          S2 manual start

Suited up to SIL2, Performance Level d, Cat. 3

## Application Examples

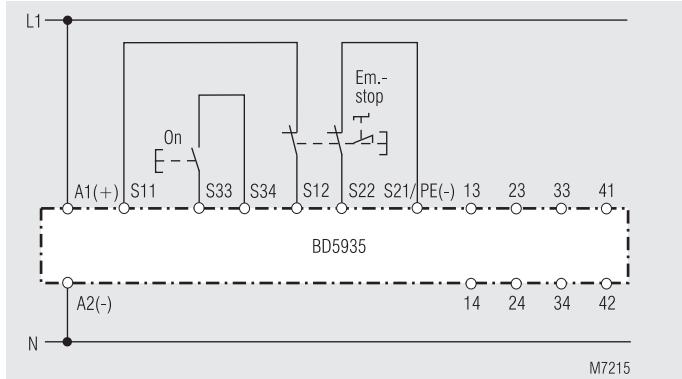

Two-channel emergency-stop circuit without cross fault detection.

**Please note "Unit programming" !**

Switches in pos.:      S1 no cross fault detection  
                          S2 manual start

Suited up to SIL3, Performance Level e, Cat. 4

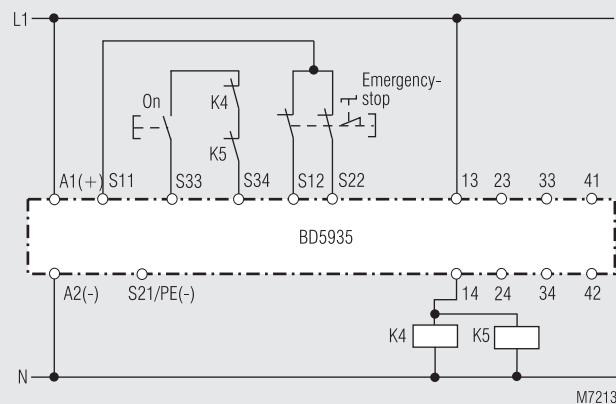

Two-channel emergency-stop circuit with cross fault detection.

**Please note "Unit programming" !**

Switches in pos.:      S1 cross fault detection  
                          S2 manual start

Suited up to SIL3, Performance Level e, Cat. 4

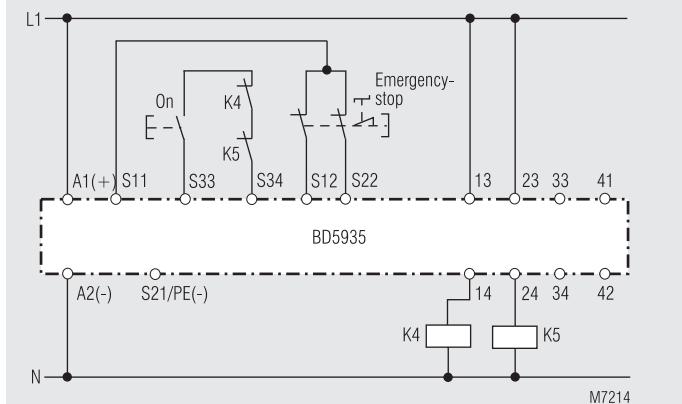

Contact reinforcement with external contactors, controlled with one contact path.

**Please note "Unit programming" !**

Switches in pos.:      S1 no cross fault detection  
                          S2 manual start

Suited up to SIL3, Performance Level e, Cat. 4

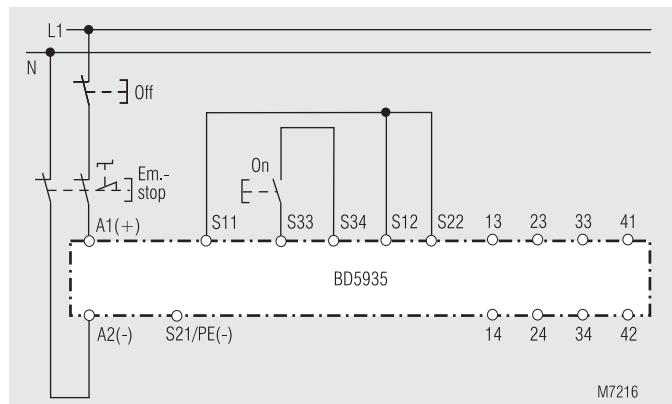

Contact reinforcement by external contactors, controlled with 2 contact paths. With switching current > 10 A, the output contacts can be reinforced by external contactors with forcibly guided contacts. The function of the external contactors is monitored by looping the NC contacts into the making circuit (terminals S33-S34).

**Please note "Unit programming" !**

Switches in pos.:      S1 no cross fault detection  
                          S2 manual start

Suited up to SIL3, Performance Level e, Cat. 4

Two-pole emergency-stop with emergency-stop control device in the supply circuit.

Application for long emergency-stop loops in which the control voltage dropped below the minimum voltage of 21 V.

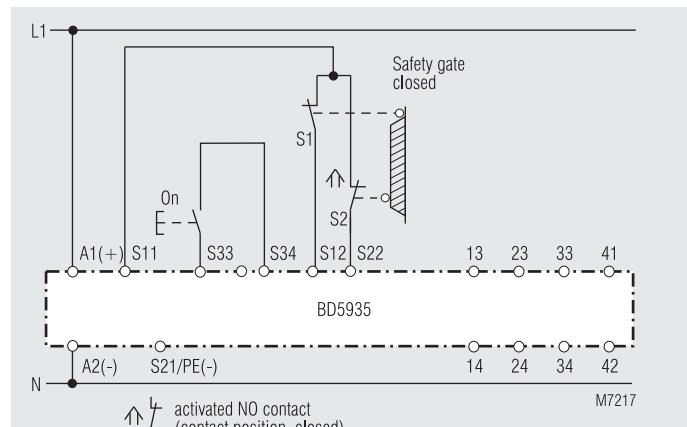

**Important:**

Single faults (line shorts over the emergency-stop control device) are not identified with this external circuit.

**Please note "Unit programming" !**

Switches in pos.:      S1 no cross fault detection  
                          S2 manual start

Suited up to SIL3, Performance Level e, Cat. 4

Two-channel monitoring of a safety gate.

The switch of S12 must close simultaneously with S22 or later.

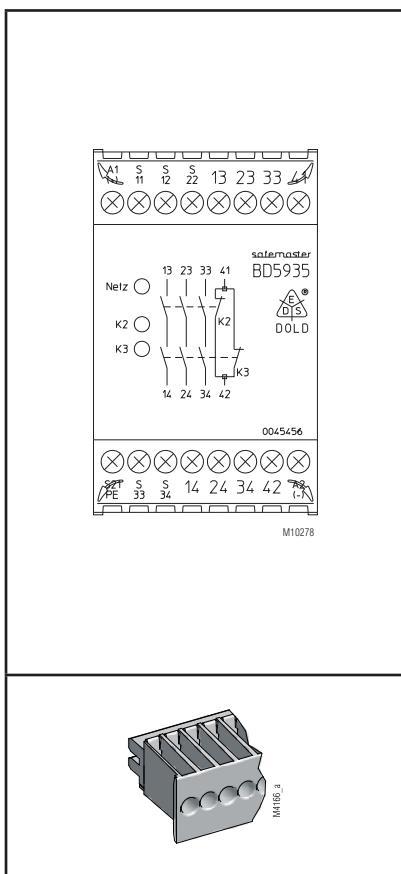

**Please note "Unit programming" !**

Switches in pos.:      S1 no cross fault detection  
                          S2 manual start

Suited up to SIL3, Performance Level e, Cat. 4

## SAFEMASTER Emergency Stop Module BD 5987

**DOLD** 

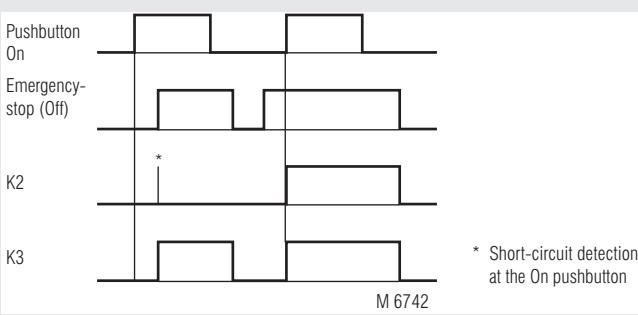

0221553

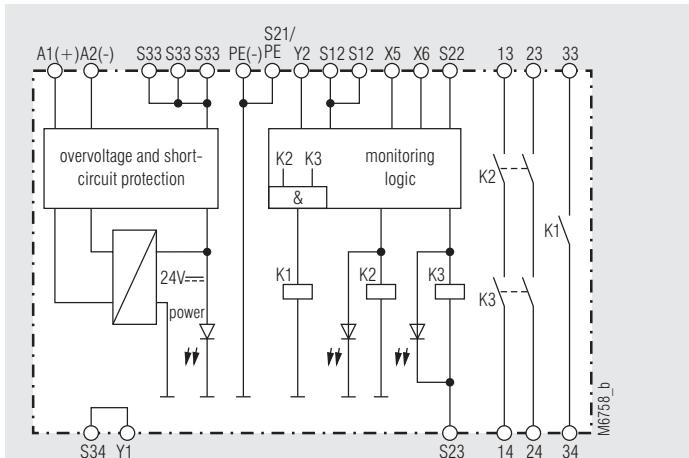

### Product Description

The BD 5987 is used to interrupt a safety circuit in a safe way. It can be used to protect people and machines in applications with e-stop buttons and safety gates. The BD 5987.02/301 can be used as electronic replacement of a safety switch according to EN 81-1-2, section 14.1.2.2.

### Function Diagram

### Block Diagram

### Your Advantages

- Safe disconnection of electrical circuits
- Line fault detection at On pushbutton
- Gold-plated contacts to switch small loads (input for PLC)
- Optionally cross fault detection in emergency stop circuit

### Features BD 5987.02/301:

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508
- Output: 2 NO contacts for AC 250 V
- 1-channel or 2-channel connection
- LED displays for channels 1 and 2
- Overvoltage and short circuit protection
- Wire connection: also 2 x 1,5 mm<sup>2</sup> stranded ferruled (isolated), DIN 46 228-1/-2/-3/-4 or 2 x 2.5 mm<sup>2</sup> stranded ferruled DIN 46 228-1/-2/-3
- Width 45 mm

BD 5987.02/301: same as BD 5987.02/001 but

- Optionally automatic On function or after activation by the On pushbutton
- Optionally cross fault detection in emergency stop circuit

BD 5987.02/001: same as BD 5987.02/001 but

- Suitable also for elevators according to EN 81-1-2
- Complies to the requirements of the directive 95/16/EG for elevators
- According to
  - Performance Level (PL) d and category 3 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 2 to IEC/EN 62061
  - Safety Integrity Level (SIL) 2 to IEC/EN 61508
- Shorter release time when opening the supply circuit
- Single-channel e-stop circuit

### Approvals and Markings

\* see variants

### Applications

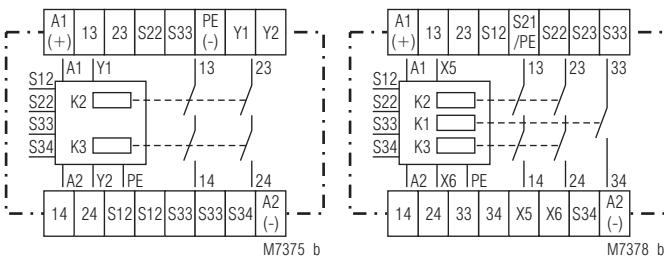

Protection of people and machines

- Emergency stop circuits on machines
- Monitoring of safety gates

### Indication

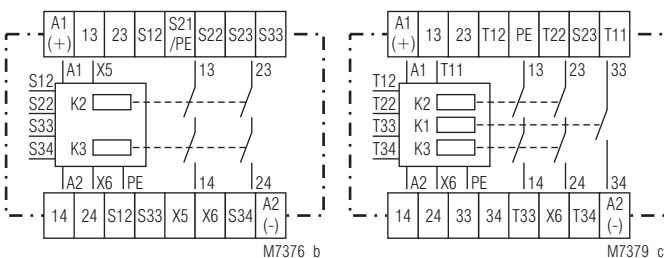

- |                   |                                   |
|-------------------|-----------------------------------|
| LED power supply: | on when operating voltage present |
| LED K2:           | on when supply on K2              |
| LED K3:           | on when supply on K3              |

## Circuit Diagrams

BD 5987.02

BD 5987.03/001

BD 5987.02/001 + /301

BD 5987.03/201

## Connection Terminals

Terminal designation	Signal description
A1 (+)	+ / L
A2 (-)	- / N
S12, S22, S23, S34, X6, Y2 T12, T22, T34	Inputs
PE (-), S21/PE, S33, X5, Y1 T11, T12, T33	Outputs
13, 14, 23, 24	Forcibly guided NO contacts for release circuit
33, 34	Indicator output

## Notes

Line fault detection at the On pushbutton:

The output contacts cannot be closed if the On pushbutton is already closed before the voltage is applied to S12, S22 (also in the event of a line fault at the On pushbutton).

A line fault at the On pushbutton which occurs after activation of the device is recognized when switching-on takes place again and closing of the output contacts is then prevented.

If a line fault occurs at the On pushbutton after the voltage is already present at S12, S22 undesired activation will take place, because this line fault does not differ from the normal closing function.

The gold-plated contacts of the BD 5987 mean that this module is also suitable for switching small loads of 1 mVA ... 7 VA, 1 mW ... 7 W in the range 0.1 ... 60 V, 1 ... 300 mA. The contacts also permit the maximum switching current. However, since the gold plating will be burnt off at this current level, the device is no longer suitable for switching small loads after this.

The PE terminal permits operation of the device in IT systems with insulation monitoring and also serves as a reference point for testing the control voltage. The internal short-circuit protection will be bridged on DC devices, if the protective ground is connected to terminal PE.

One or more extension modules BN 5989 or external contactors with forcibly guided contacts may be used to multiply the number of contacts of the emergency stop module BD 5987.

For automatic restart:

S22 must be connected before S12. S12 initiates the automatic restart. With manual restart it is not necessary to follow this order.

## Technical Data

### Input

#### Nominal voltage $U_N$ :

AC 24, 42, 48, 110, 127, 230, 240 V<sup>1)</sup>  
DC 24 V

#### Voltage range:

at 10% residual ripple:  
at 48% residual ripple:

#### Nominal consumption:

approx. 5.5 VA

#### Nominal frequency:

50 / 60 Hz

#### Control voltage at S33:

DC 24 V

#### Control current

------------------------	--	--

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	Power supply not connected
LED "K2" lights up, but "K3" remains off	- Safety relay K2 is welded (replace device) - A 1-channel switch-off occurred on S22, T22 e.g. S23 (switch channel off on S12 e.g. T12)
LED "K3" lights up, but "K2" remains off	- Safety relay K3 is welded (replace device) - A 1-channel switch-off occurred on S12 e.g. T12 (switch channel off on S22, T22 e.g. S23)
Device cannot be activated	- Safety relay is welded (replace device) - Manual start mode: Line fault on start-button (disconnect power supply and remove fault) - Automatic start mode: X5 - X6 e.g. T33 - X6 are not bridged

## Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Variants

**BD 5987.02/61:** with UL approval (Canada/USA)  
**BD 5987.02/001:** Optionally cross fault monitoring on the emergency stop loop (see application M6749)  
 Optionally automatic On function when operating voltage is applied or after activation by the On pushbutton.

Jumper assignment for functions:  
 Activation via On pushbutton / or automatic On function:

On pushbutton S12-S34 or S33-S34	Jumper X5 - X6	Function
	• •	The output contacts are switched only after operation of the On pushbutton. Line fault monitoring at the On pushbutton.
	• •	Automatic On function for operating voltage Off/On or after emergency-stop release

**BD 5987.03/001:** with 2 NO contacts,  
1 signalling contact AC/DC 0,1 ... 1 A / 10 ... 120 V

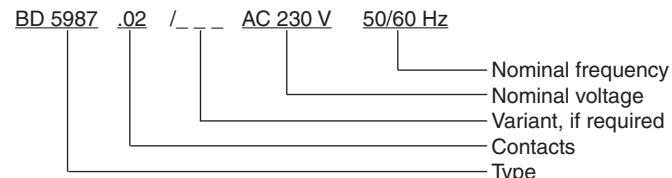

**BD 5987.03/201:** see BD 5987.03/001,  
but with special terminal designation

Jumper assignment for functions:  
 Activation via On pushbutton / or automatic On function

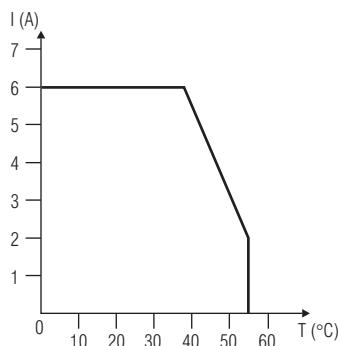

On pushbutton T11-T34 or T12-T34	Jumper T33 - X6	Function
	• •	The output contacts are switched only after operation of the On pushbutton. Line fault monitoring at the On pushbutton.
	• •	Automatic On function for operating voltage Off/On or after emergency-stop release

**BD 5987.02/301:** Starting behaviour as with BD 5987.02/001, shorter release time when opening the supply circuit, Suitable also for elevators according to EN 81-1/-2, Complies to the requirements of the directive 95/16/EG for elevators.

## Ordering example for variants

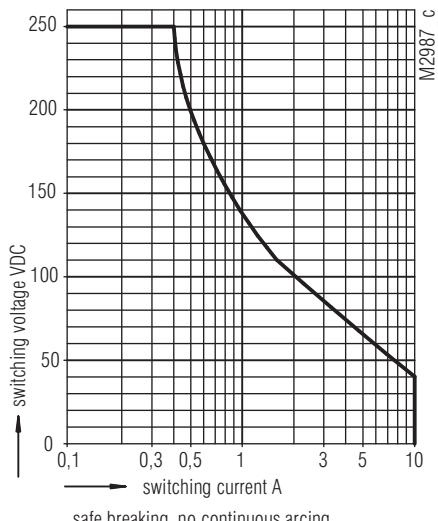

## **Characteristics**

## Continuous current limit curve (Current via two contact rows)

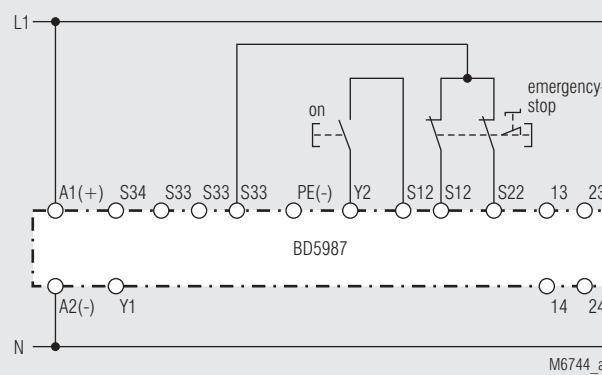

M6759

## Continuous current limit curve

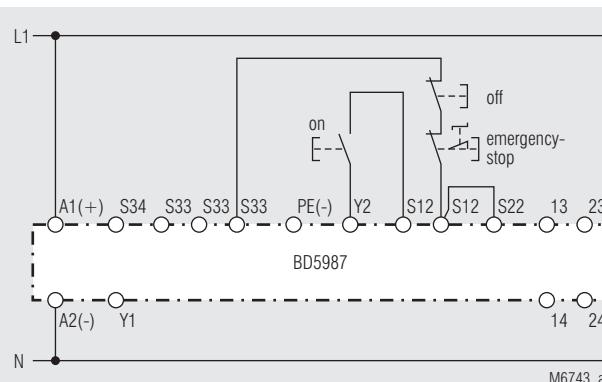

Limit curve for arc-free operation with resistive load

## Application Examples

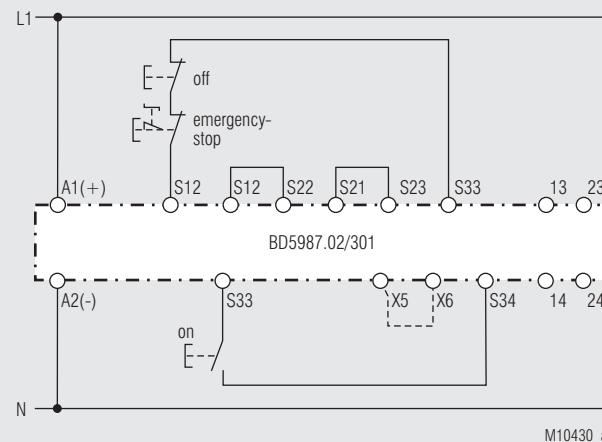

Two-channel emergency stop circuit.

Suited up to SIL3, Performance Level e, Cat. 4

M6743 a

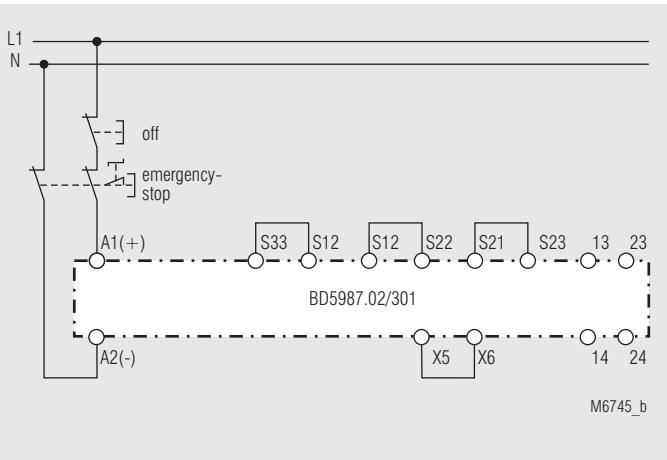

M10130 3

Single-channel emergency stop circuit. This circuit does not have any redundancy in the emergency stop control circuit.

undancy in the emergency stop control circuit.

## Application Examples

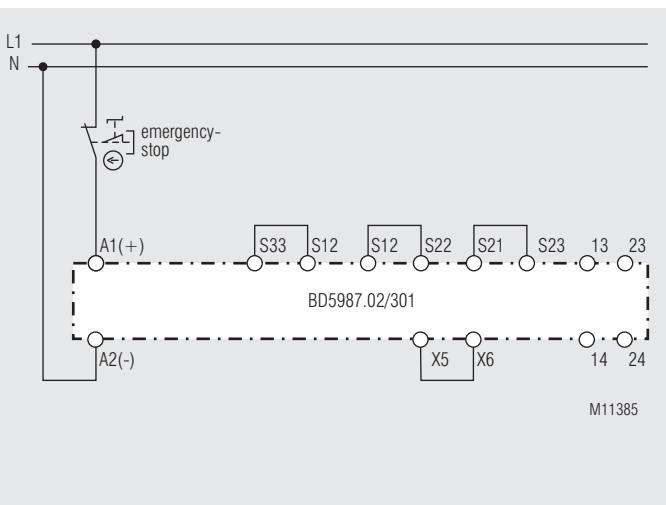

Two-pole emergency stop circuit with emergency stop control device in supply circuit with automatic ON-function.

Application for long emergency stop loops where the control voltage drops below the minimum voltage of 21 V.

### Attention:

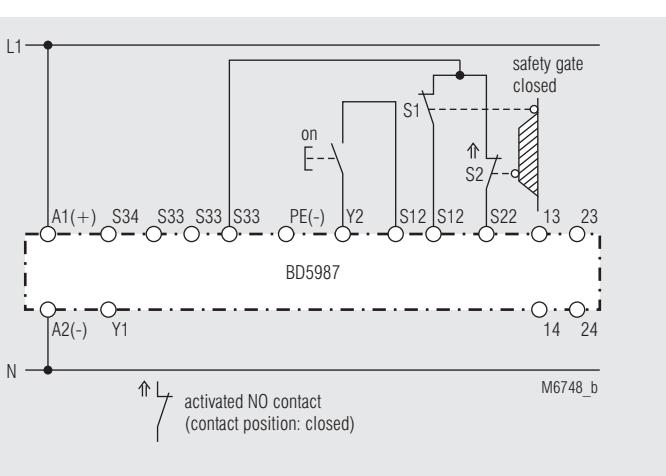

Single faults (e.g. line faults at the emergency stop control device) are not detected with this external circuit configuration.

Suited up to SIL2, Performance Level d, Cat. 3

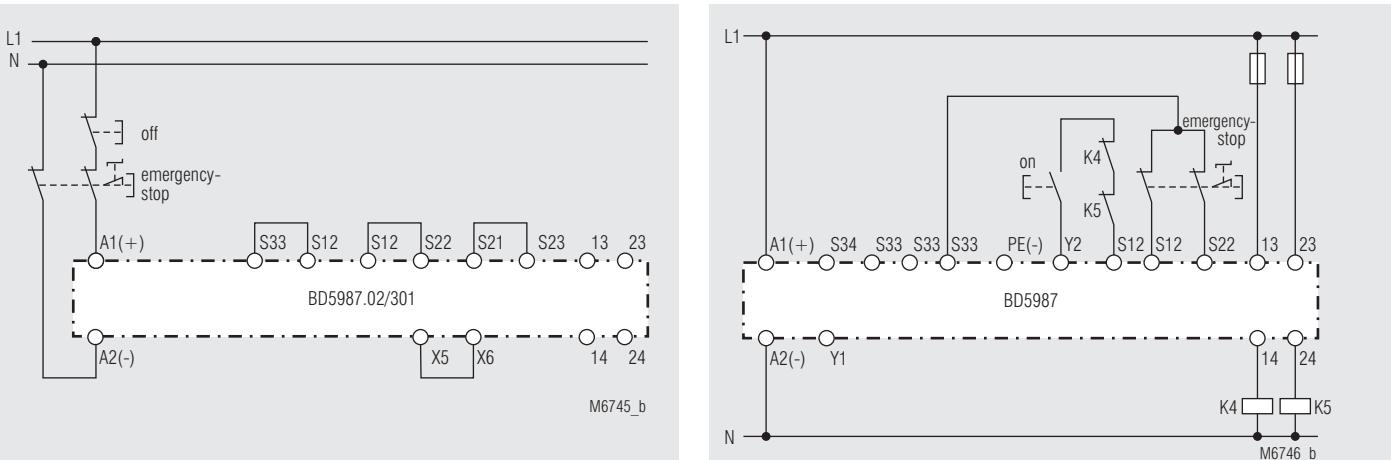

Single-channel emergency stop circuit. This circuit does not have any redundancy in the emergency stop control circuit

Suited up to SIL2, Performance Level d, Cat. 3

Two-channel monitoring of a safety gate.

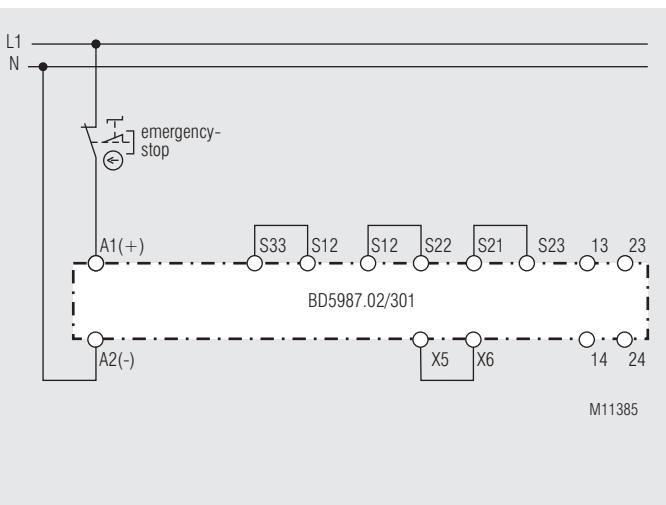

Suited up to SIL3, Performance Level e, Cat. 4

Contact reinforcement by external contactors, 2-channel.

The output contacts can be reinforced by external contactors with forcibly guided contacts for switching currents > 10 A. Functioning of the external contactors is monitored by looping the NC contacts into the closing circuit (terminals Y2 - S12).

Suited up to SIL3, Performance Level e, Cat. 4

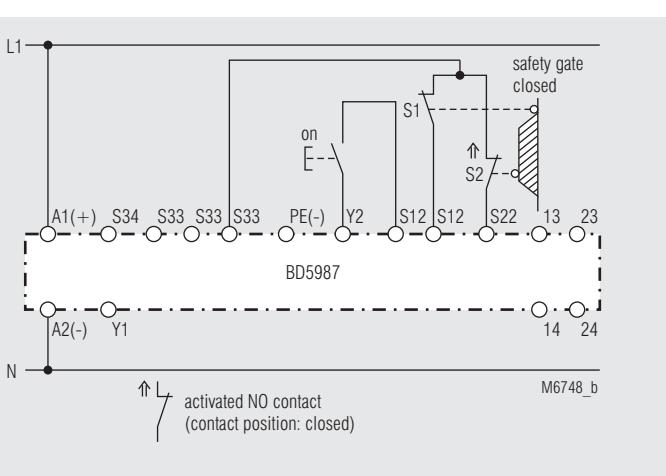

Two-channel emergency stop circuit with cross fault detection.

Activation via On pushbutton. ---- Jumper X5 - X6:

Jumper X5 - X6 must be fitted for the automatic On function.

The On pushbutton is not required.

Suited up to SIL3, Performance Level e, Cat. 4

Two-channel emergency-stop circuit without cross fault detection.

Activation via On pushbutton. ---- Jumper X5 - X6:

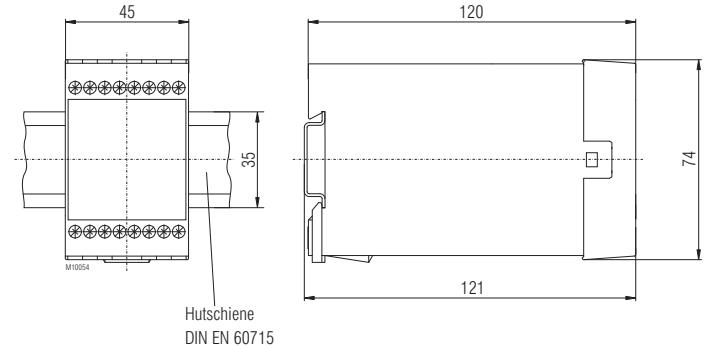

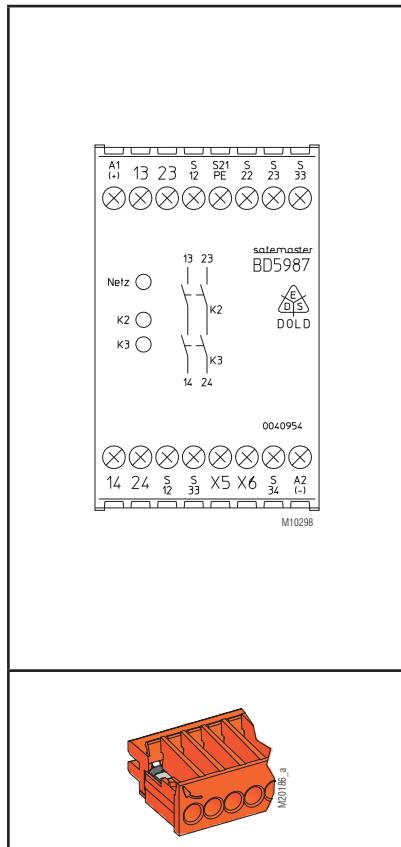

Jumper X5 - X6 must be fitted for the automatic On function.

The On pushbutton is not required.

Suited up to SIL3, Performance Level e, Cat. 4

## SAFEMASTER

Emergency Stop Module With Voltage Failure Detection

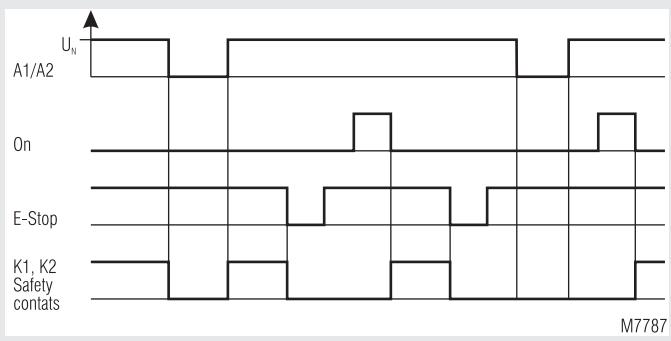

BH 5903, BL 5903

**DOLD** 

0235200

### Function Diagram

### Indicators

upper yellow LEDs  
run 1, run 2:  
on when unit works correct,  
fault signal via flashing code

lower green LEDs  
K1, K2:  
on when K1, K2 energized

### Notes

- The BH 5903 e.g. BL 5903 stores the state of emergency stop. After pressing and releasing the e-stop button the unit can only be reset by pressing the button. If the unit switches off because of phase failure it resets automatically when the voltage returns

### • According to

- Performance Level (PL) e and category 4 to EN ISO 13849-1: 2008
- SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
- Safety Integrity Level (SIL 3) to IEC/EN 61508
- Category 4 to EN 954-1

### • E-stop with latching function

### • Automatic start when voltage returns after phase failure when no E-Stop was operated before phase failure.

- Reset after E-stop with push button
- Output max. 3 NO contacts, see contacts
- B\_5903.\_/\_00000: 1 E-stop loop 2-channel operated
- B\_5903.\_/\_00020: 2 E-stop loops single channel operated
- Cross fault monitoring
- Feedback loop for external contact reinforcement
- Short circuit and broken wire detection on all inputs
- LED indication for channel 1 and 2 and for diagnostics
- Removable terminal strips
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled (isolated), DIN 46 228-1/-2/-3/-4 or
- 2 x 2.5 mm<sup>2</sup> stranded ferruled DIN 46 228-1/-2/-3
- BH 5903: width 45 mm  
BL 5903: width 90 mm

### Approvals and Markings

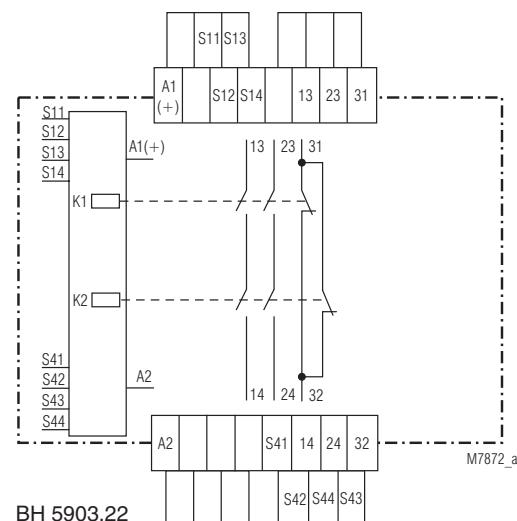

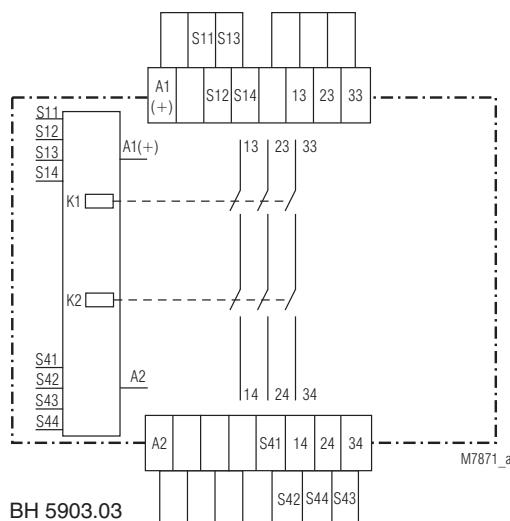

\* see variants

### Applications

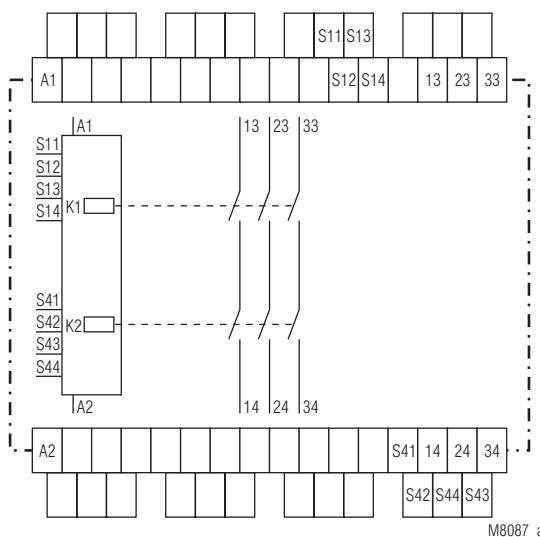

- For plants, that should start automatically at return of voltage after phase failure. E.g. Compressor plants, water and sewage water plants.

### Circuit Diagrams

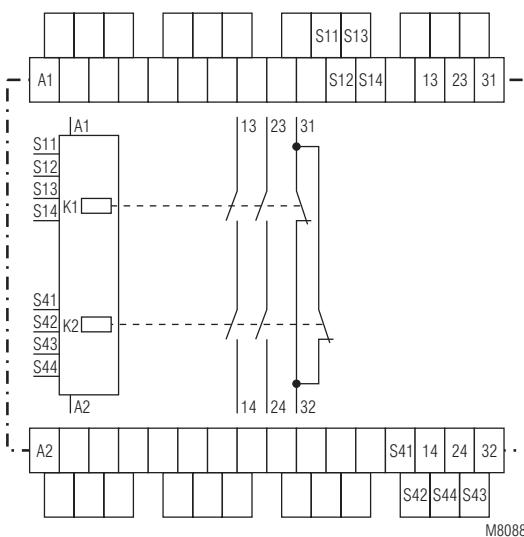

BH 5903.22

## Circuit Diagrams

BL 5903.03

BL 5903.22

### Connection Terminals

Terminal designation	Signal description
A1+	+ / L
A2	- / N
S12, S14, S42, S44	Inputs
S11, S13, S41, S43	Outputs
13, 14, 23, 24, 33, 34	Forcibly guided NO contacts for release circuit
31,32	Forcibly guided NO contacts for indicator signal

### Technical Data

#### Input

	BH 5903	BL 5903
Nominal voltage $U_N$ :	DC 24 V	AC 24, 110, 230 V
Voltage range:	-	0.8 ... 1.1 $U_N$
at max. 5 % residual ripple:	0.85 ... 1.15 $U_N$	-
Nominal consumption:	max. 170 mA	max. 7 VA
Nennfrequenz:	-	50 / 60 Hz
Control voltage over S11, S13, S41, S43:	pulses max. 23 V at $U_N$	
Control current over S12, S14, S42, S44:	je 4.5 mA bei $U_N$	
Min. voltage at terminals S12, S14, S42 S44:	DC 16 V	
Short circuit protection:	internal with PTC	

#### Output

Contact	
BH 5903.03:	3 NO contacts
BH 5903.22:	2 NO, 1 NC contacts (only to be used as monitoring contact)
Operate delay typ. at $U_N$ :	
Manual start:	max. 45 ms
Automatic start:	max. 800 ms, if voltage failure > approx. 150 ms max. 7 s, if voltage failure < approx. 150 ms
Release delay typ. at $U_N$ :	
Disconnecting the supply:	max. 18 ms
Disconnecting S12, S22:	15 ms
Contact type:	Relay, forcibly guided
Output rated voltage:	AC 250 V
Switching of low loads:	DC: see continuous limit curve $\geq 100$ mV
Thermal current $I_{th}$ :	5 A

### Technical Data

#### Switching capacity

to AC 15:	
NO contact:	AC 3 A / 230 V IEC/EN 60 947-5-1
NC contact:	AC 2 A / 230 V IEC/EN 60 947-5-1
to DC 13 at 0.1 Hz:	8 A / DC 24 V IEC/EN 60 947-5-1

#### Electrical life

to AC 15 at 2 A, AC 230 V:	10 <sup>5</sup> switching cycles IEC/EN 60 947-5-1
----------------------------	--

#### Permissible switching frequency:

max. 1 200 switching cycles / h

#### Short circuit strength

max. fuse rating:	6 A gL IEC/EN 60 947-5-1
line circuit breaker:	C 8 A

10 x 10<sup>6</sup> switching cycles

### General Data

#### Operating mode:

Continuous operation

#### Temperature range

$\pm 0 \dots + 50$  °C

storage : - 25 ... + 85 °C

#### Altitude:

< 2.000 m

#### Clearance and creepage distances

rated impulse voltage / pollution degree: 4 kV / 2 (basis insulation) IEC 60 664-1

#### EMC

Electrostatic discharge: 8 kV (air) IEC/EN 61 000-4-2

HF-irradiation: 10 V / m IEC/EN 61 000-4-3

Fast transients: 2 kV IEC/EN 61 000-4-4

#### Surge voltages between

wires for power supply: 1 kV IEC/EN 61 000-4-5

between wire and ground: 2 kV IEC/EN 61 000-4-5

HF-wire guided: 10 V IEC/EN 61 000-4-6

Interference suppression: Limit value class B EN 55 011

#### Degree of protection

Housing: IP 40 IEC/EN 60 529

Terminals: IP 20 IEC/EN 60 529

Thermoplastic with V0 behaviour

according to UL subject 94

Amplitude 0.35 mm IEC/EN 60 068-2-6

frequency 10 ... 55 Hz

#### Vibration resistance:

Shock resistance: Acceleration: 10 g

Duration of impuls: 16 ms

Number of shocks: 1000 per axis on all three axes

Climate resistance: 0 / 050 / 04 IEC/EN 60 068-1

Terminal designation: EN 50 005

## Technical Data

<b>Wire connection:</b>	1 x 4 mm <sup>2</sup> solid or 1 x 2.5 mm <sup>2</sup> stranded ferruled (isolated) or 2 x 1.5 mm <sup>2</sup> stranded ferruled (isolated) DIN 46 228-1/-2/-3/-4 or 2 x 2.5 mm <sup>2</sup> stranded ferruled DIN 46 228-1/-2/-3
<b>Wire fixing:</b>	Box terminal with wire protection, removable terminal strips
<b>Mounting:</b>	DIN rail
<b>Weight:</b>	320 g
<b>Dimensions</b>	
<b>Width x height x depth</b>	
BH 5903:	45 x 84 x 121 mm
BL 5903:	90 x 84 x 121 mm

## Safety Related Data

### Values according to EN ISO 13849-1:

Category:	4
PL:	e
MTTF <sub>d</sub> :	180.9
DC <sub>avg</sub> :	97.9
d <sub>op</sub> :	365
h <sub>op</sub> :	24
t <sub>Zyklus</sub> :	3600
≈ 1	/h (hour)

### Values according to IEC/EN 62061 / IEC/EN 61508:

SIL CL:	3	IEC/EN 62061
SIL	3	IEC/EN 61508
HFT <sup>1)</sup> :	1	
DC <sub>avg</sub> :	97.9	%
SFF	99.4	%
PFH <sub>D</sub> :	5.57E-10	h <sup>-1</sup>

<sup>1)</sup> HFT = Hardware-Failure Tolerance

The values stated above are valid for the standard type.  
Safety data for other variants are available on request.  
The safety relevant data of the complete system has to be determined by the manufacturer of the system.

## UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL 508, "general use applications"

<b>Nominal voltage U<sub>N</sub>:</b>	DC 24 V
<b>Ambient temperature:</b>	0 ... +50°C
<b>Switching capacity:</b>	
Ambient temperature 50°C:	Pilot duty B300 5A 250Vac G.P. 5A 24Vdc
Semiconductor outputs:	24Vdc, 100 mA
<b>Wire connection:</b>	60°C / 75°C copper conductors only AWG 20 - 12 Sol Torque 0.8 Nm AWG 20 - 14 Str Torque 0.8 Nm

Technical data that is not stated in the UL-Data, can be found in the technical data section.

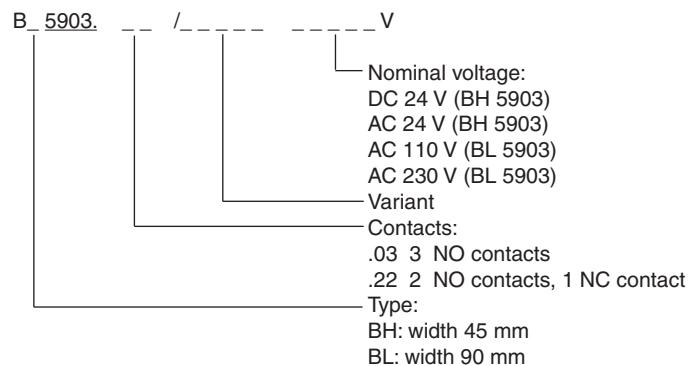

## Standard Type

BL 5903.03/00000 AC 230 V	0053510
Article number:	0053510
• Output:	3 NO contacts
• for 1 E-stop loop, 2 channel operated	
• Nominal voltage U <sub>N</sub> :	AC 230 V
• Width:	45 mm

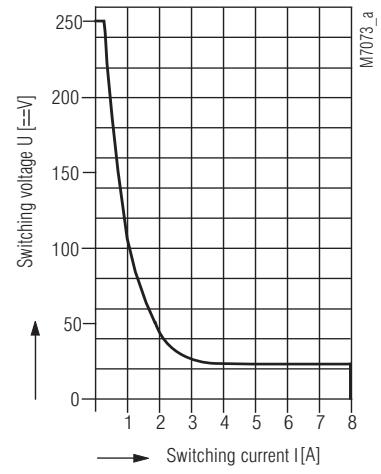

## Variants

B_ 5903. _/00000:	for 1 E-stop loop 2- channel operated
B_ 5903. _/00020:	for 2 E-Stop loops singel channel operated
BH 5903. _/ _ _ _ _/61:	with UL-approval

## Ordering example for variant

## Characteristic

Continuous limit curve

## Fault Indication By Flashing Code

The failure codes are displayed by a flashing sequence of the upper yellow LEDs run 1, run 2. Flashing frequency: env. 0.5 s on, 0.05 s off, end of the sequence: env. 2 s off. It is possible that the two processors show different failure codes. If a failure is displayed, the relays K1 and K2 are switched off.

The module BH 5904 shows 2 types of failure codes:

### 1. FAILURE type 1:

These failures are serious and do not allow further operation of the module. The module can only be reset by switching the power supply off and on again.

### 2. FAILURE type 2:

This failure is concerning the function faults in conjunction with the safety controller. The module can be reset by pressing the reset button.

## Failure type 1

N°*)	Description	Mesures et conseils
0	Internal module failure (LEDs are continuously off)	If both LEDs stay off, the module is defective and has to be repaired.
6	Undervoltage detection or Overvoltage detection	1) Left LED is flashing: The supply voltage dropped below the permitted value (< approx. 0.85 U <sub>N</sub> ) 2) Right LED is flashing: The supply voltage went over the permitted value (> approx. 1.15 U <sub>N</sub> + 5 % residual ripple)
7	Input failure	A short circuit has been detected on the inputs of the unit or the 2 signals of a 2-channel sensor (feedback circuit, start signal of controller, valve) do not correspond (short circuit, broken wire or other fault)
8	Failure on relay output	Output relay defective 1) Check circuit and current. 2) The relay service life is crossing
9		Please try to evaluate the circumstances that lead to this fault and check with the supplier or manufacturer.
10	Internal module failure	
11		
12		
13	Internal module failure	The module has to be repaired
14		

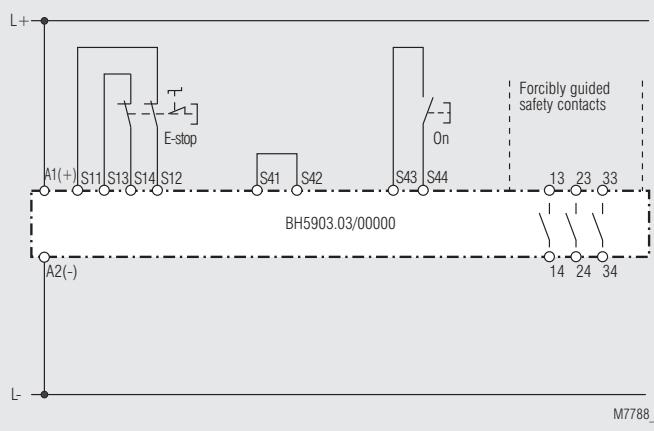

\*) No.: Number of flash pulses in a series

## Failure type 2

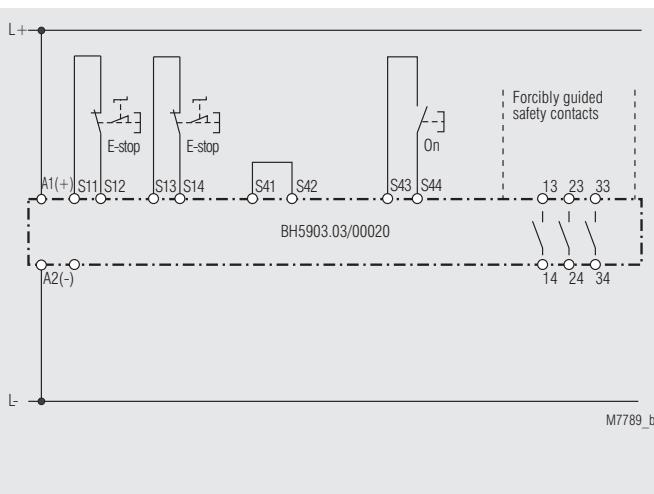

N°*)	Description	Mesures et conseils
1	E-stop activated	
2	Fault on reset button	1) The start button must not be pressed longer than 3 sec. 2) During start up of the unit and initialising the start button must not be pressed
4	Switch off fault	The unit showed already a fault before switching off
6	Feedback failure	Both LED are flashing Feedback on S41/S42 not closed

\*) No.: Number of flash pulses in a series

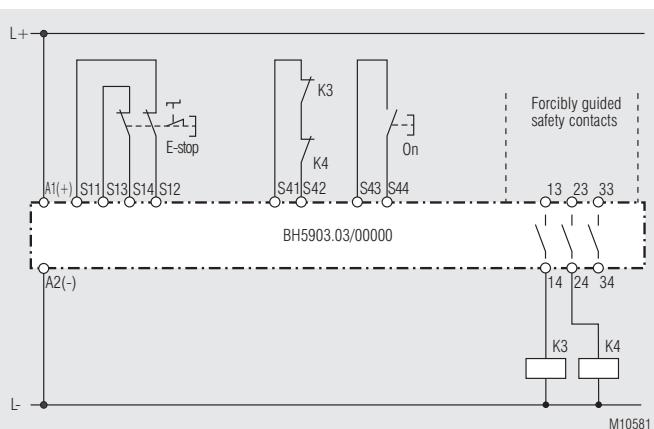

## Application Examples

BH 5903.03/00000 with one E-Stop loop (2-channel), automatic restart after phase failure and manual restart after E-stop. Automatic reset is only active when no E-Stop was operated before phase failure.

BH 5903.03/00020 with two E-Stop loops (single-channel), automatic restart after phase failure and manual restart after E-stop. Automatic reset is only active when no E-Stop was operated before phase failure. Max. Cat. 3, PL d because of fault exclusion in the wiring.

BH 5903 with external contact reinforcement

# Safety Technique

## SAFEMASTER

### Emergency Stop Module With Time Delay

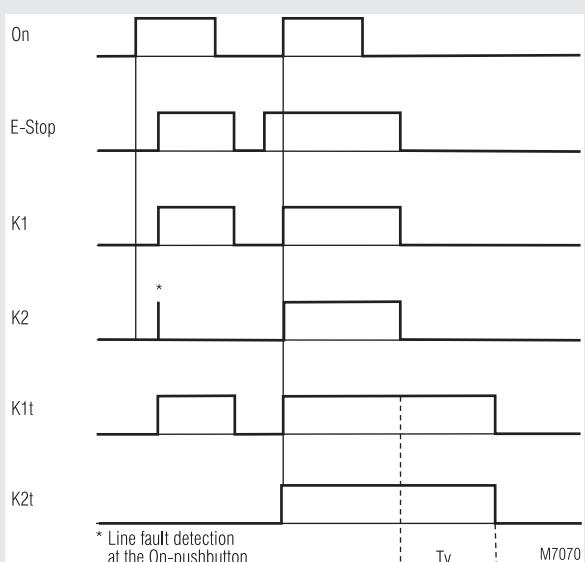

BH 5928, BI 5928

**DOLD** 

0226419

#### Function Diagram

#### • According to

- Performance Level (PL) e and category 4 to EN ISO 13849-1
- SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
- Safety Integrity Level (SIL 3) to IEC/EN 61508 and IEC/EN 61511
- Output: 3 NO or 2 NO, 1 NC instantaneous contacts and 3 NO release delayed contacts
- Single and 2-channel operation
- Line fault detection on On-button, when On-button is connected to S33-S34
- Manual restart with button on S33-S34 or automatic restart with bridge between S13-S14
- With or without cross fault monitoring in the E-stop loop
- LED indication for supply, channel 1/2 and release delayed contacts
- Removable terminal strips
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled (isolated), DIN 46 228-1/-2/-3/-4 or 2 x 2.5 mm<sup>2</sup> stranded ferruled DIN 46 228-1/-2/-3
- Width  
BH 5928: 45 mm  
BI 5928: 67.5 mm

#### Approvals and Markings

\* see variants

#### Applications

Protection of people and machines

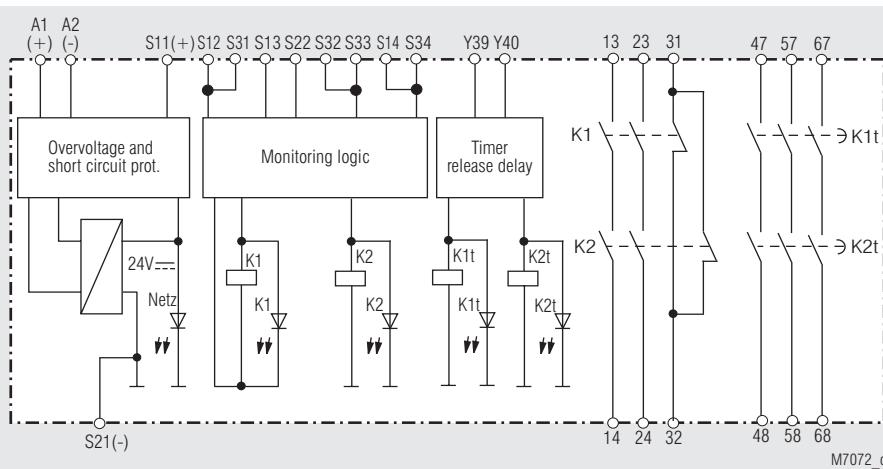

- Emergency stop circuits on machines, stop category 1 can be realised
- Monitoring of safety gates

#### Indicators

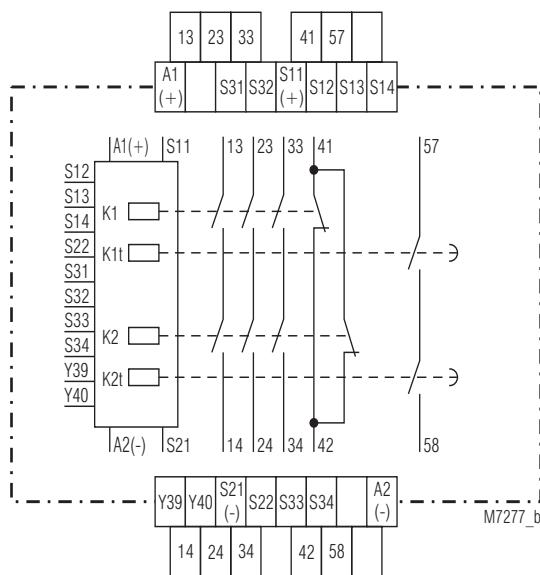

LED power:  
LEDs K1, K2:

on, when supply connected  
on, when relay K1 and K2  
resp. K1<sub>t</sub> and K2<sub>t</sub> energized

BH 5928.47

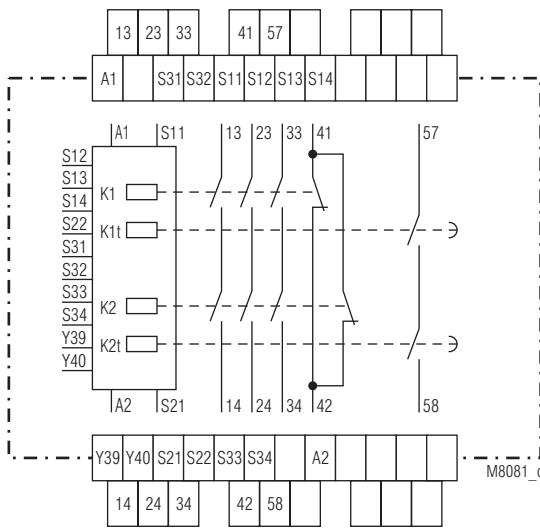

BH 5928.91

BH 5928.92

BH 5928.93

BI 5928.47/100

Connection Terminals		Technical Data	
Terminal designation	Signal description	Input	
A1(+)	+ / L	<b>Nominal voltage <math>U_N</math>:</b> BH 5928: BH 5928.92/900, BI 5928.47/100:	
A2 (-)	- / N	DC 24 V, AC/DC 24 V	
S12, S14, S22, S31, S32, S34, Y39	Inputs	DC 24 V	
S11, S13, S21, S33, Y40	Outputs	DC                    AC/DC 0.9 ... 1.1 $U_N$ 0.95 ... 1.1 $U_N$ 0.8 ... 1.1 $U_N$ 0.8 ... 1.1 $U_N$	
13, 14, 23, 24, 33, 34	Positive driven NO contacts for release circuit	AC approx. 6.0 VA	
37, 38, 47, 48, 57, 58, 67, 68	NO contacts, delay	DC approx. 3.5 W	
31, 32, 41, 42	Positive guided indicator output	50 / 60 Hz 1 s DC 23 V at $U_N$	
Notes		Nominal consumption: Nominal frequency: Min. Off-time: Control voltage on S11: Control current over S12, S32: Min. voltage on S12, S32: Short-circuit protection: Overvoltage protection:	
To select automatic restart terminals S13 - S14 must be bridged, S33 - S34 must be opened. Open terminals S13 - S14 select manual restart, the On-button must then be connected to S33 - S34.		40 mA at $U_N$ each	
Line fault detection on On-button: The line fault detection is only active when the time delayed relais K1, and K2, have released and then S12 (channel A) and S32 (channel B) are switched simultaneously. If the On-button is closed before S12, S31, S32 is connected to voltage (also when line fault across On-button), the output contacts will not close. The unit will not restart before the time delay is finished. A line fault across the On-button which occurred after activation of the relay, will be detected with the next activation and the output contacts will not close. If a line fault occurs after the voltage has been connected to S12, S31, S32, the unit will be activated because this line fault is similar to the normal On-function.		DC 21 V when relay activated Internal PTC Internal VDR	
The unit can be operated with single channel and 2-channel operation with cross fault monitoring. For connection please refer to application examples.		Output	
The gold plated contacts of the BH 5928 mean that this module is also suitable for switching small loads of 1 mVA - 7 VA, 1 mW - 7 W in the range 0.1 - 60 V, 1 - 300 mA. The contacts also permit the maximum switching current. However since the gold plating will be burnt off at this current level, the device is no longer suitable for switching small loads after this. The terminal S21 permits the operation of the device in IT-systems with insulation monitoring, serves as a reference point for testing the control voltage and is used to connect the E-stop loop when cross fault monitoring is selected.		Contacts	
Connecting the terminal S21 to the protective ground bridges the internal short-circuit protection of Line A2(-). The short-circuit protection of line A1(+) remains active.		BH 5928.47, BI 5928.47/100: 3 NO, 1 NC contacts instantaneous and 1 NO contact release delayed BH 5928.91: 2 NO contacts instantaneous, and 2 NO contacts release delayed BH 5928.92: 2 NO, 1 NC contacts instantaneous and 3 NO contacts release delayed BH 5928.93: 3 NO contacts instantaneous and 3 NO contacts release delayed	
Y39 - Y40 must be closed to have timed outputs. By opening the bridge between Y39 and Y40 the time delay can be interrupted immediately. Without bridge the contacts switch without delay. The time setting has to be sealed by the user after test.		The NC contacts 31-32 or 41-42 can only be used for monitoring.

<b>Switching capacity</b>	
to DC 13 BH5928.47 NO contact 57/58:	1 A / DC 24 V IEC/EN 60 947-5-1

 Technical data that is not stated in the CCC-Data, can be found in the technical data section.

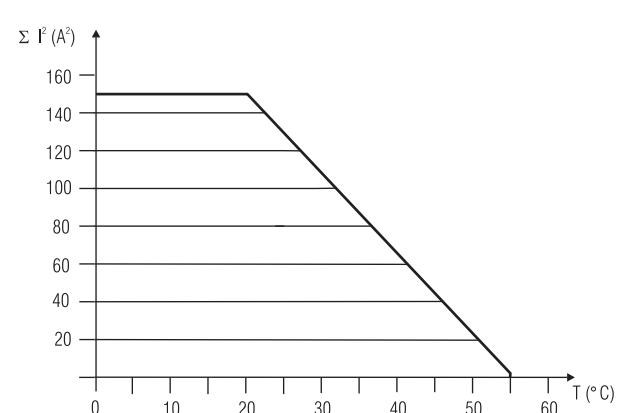

Standard Type	Characteristics
BH 5928.92/61 DC 24 V 0.5 ... 5 s Article number: 0060264 • Output: 2 NO contacts, 1 NC contact instantaneous and 3 NO contacts release delayed • Nominal voltage $U_N$ : DC 24 V • Time delay $t_V$ : 0.5 ... 5 s • Width: 45 mm	 <p>switching voltage VDC</p> <p>switching current A</p> <p>M5334_C</p>
<b>Variant</b>	
BH 5928._/_/_/61: with UL approval BH 5928._/001: with fix time delay fixed times: 1 s, 3 s, 5 s, 10 s, 300s other times on request	
BH 5928._/_/900: with adjustable time delay suitable for light curtains and reed contacts switches	
BI 5928.47/100: with adjustable time delay tolerates voltage drop up to 6 V in e-stop circuit	
<b>Ordering example for variants:</b>	Arc limit curve for resistive load (instantaneous contact)
B_5928._/_/_/ DC 24 V 50/60 Hz 1 ... 10 s	 <p>switching voltage VDC</p> <p>switching current A</p> <p>M2871_C</p>
<p>for fixed time end of scale value, other ranges on request</p> <p>Nominal frequency</p> <p>Nominal voltage</p> <p>Variant, if required</p> <p>Contacts</p> <p>.47 = 3 NO contacts, 1 NC contact instantaneous and 1 NO contact release delayed</p> <p>.91 = 2 NO contacts instantaneous and 2 NO contacts release delayed (only at BH 5928)</p> <p>.92 = 2 NO contacts, 1 NC contact instantaneous and 3 NO contacts release delayed</p> <p>.93 = 3 NO contacts instantaneous and 3 NO contacts release delayed</p>	<p>safe breaking, no continuous arcing, max. 1 switching cycle / s</p> <p>Arc limit curve for resistive load (delayed contact)</p>

Arc limit curve for resistive load (instantaneous contact)

#### Arc limit curve for resistive load (delayed contact)

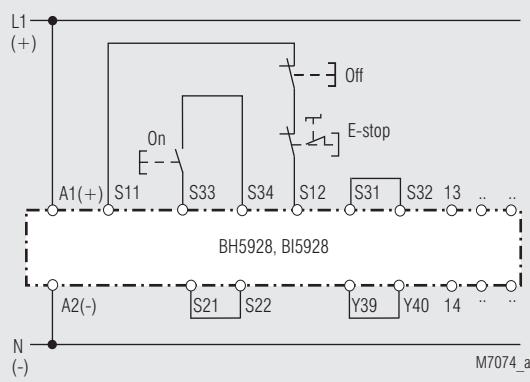

$$\Sigma |^2 = |^2 + |^2 + |^2$$

Current in contact paths

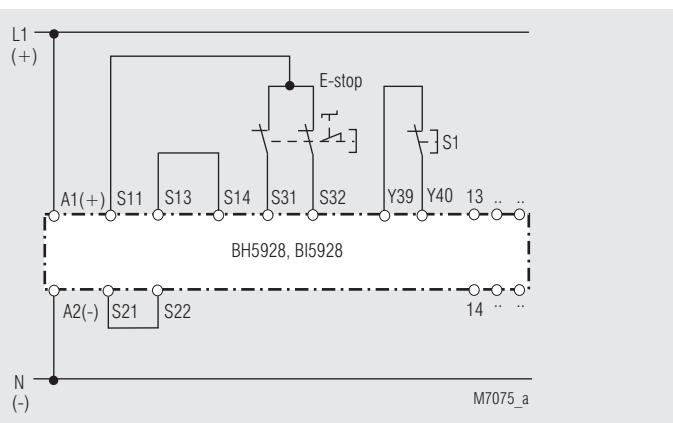

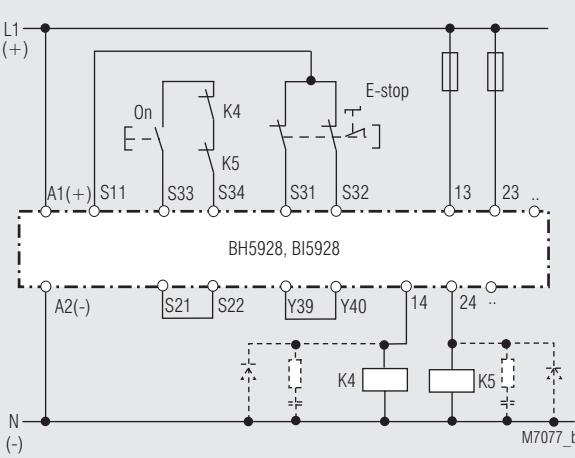

Max. current at 55°C over 3 contact paths = 0.5 A  $\cong 0.5^2 \times 6 = 1.5$  A<sup>2</sup>

### Quadratic total current limit curve

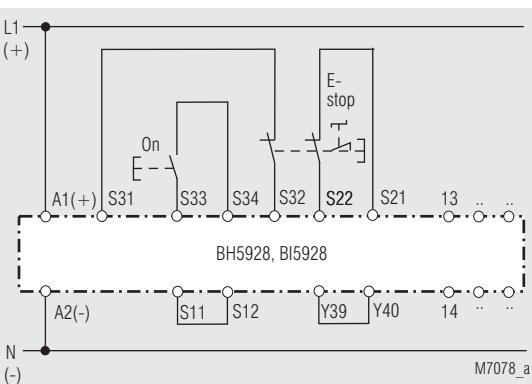

## Application Examples

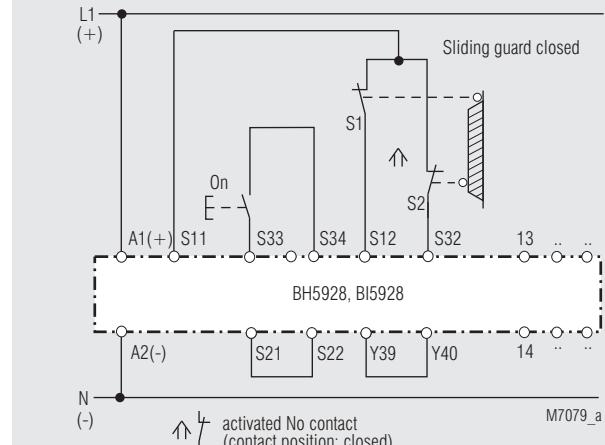

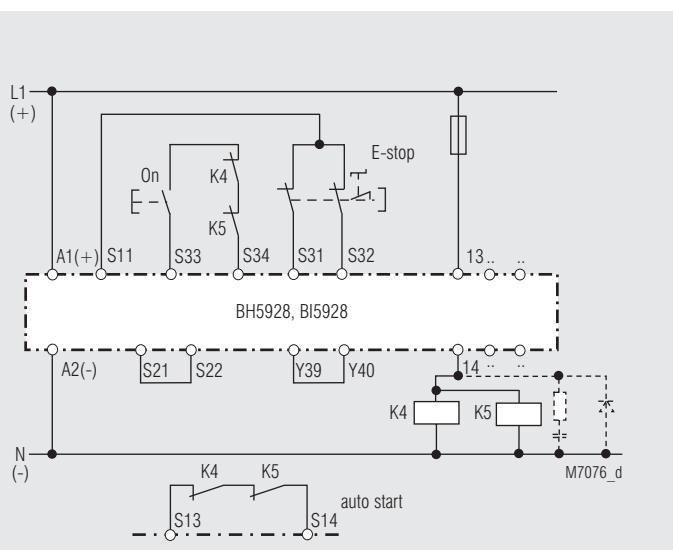

Single channel emergency stop circuit. This circuit does not have any redundancy in the emergency-stop control circuit  
Suited up to SIL2, Performance Level d, Cat. 3

2-channel emergency stop circuit without cross fault monitoring autostart and interruption of time by S1  
Suited up to SIL3, Performance Level e, Cat. 4

2-channel emergency stop circuit without cross fault monitoring autostart and interruption of time by S1  
Suited up to SIL3, Performance Level e, Cat. 4

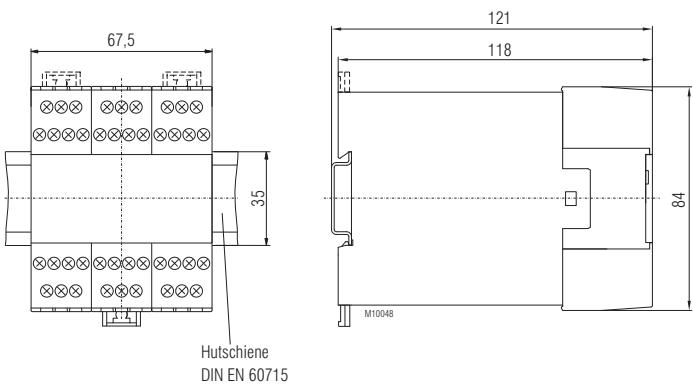

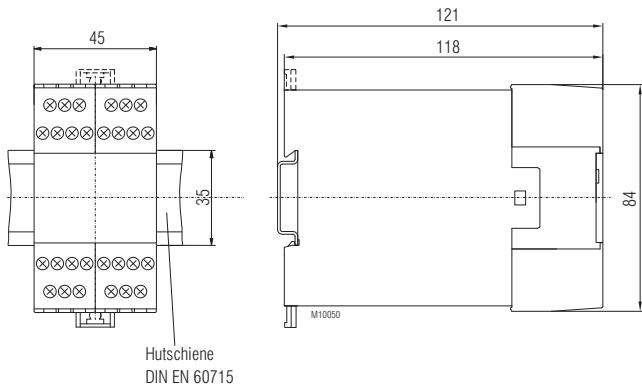

2-channel safety gate monitoring  
Suited up to SIL3, Performance Level e, Cat. 4

# Safety Technique

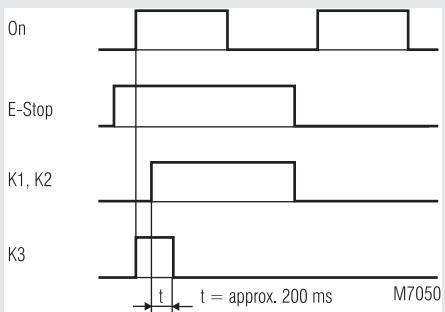

**SAFEMASTER**  
**Emergency Stop Module**  
**BN 5930.48/203, BN 5930.48/204**

**DOLD** 

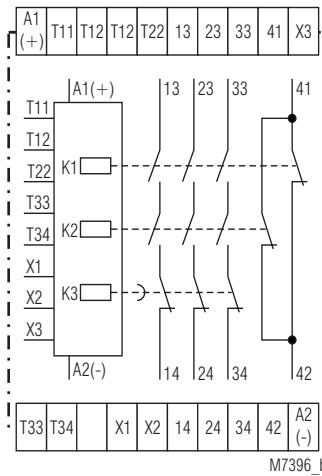

0221559

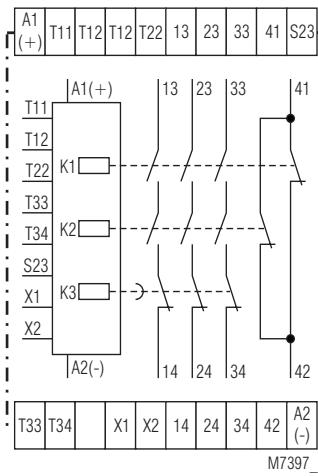

## Function Diagram

## Circuit Diagrams

BN 5930.48/203

BN 5930.48/204

## Your Advantages

- Can be used for long leads in the e-stop loop.  
This allows a long distance between e-stop module and the e-stop button.
- Crossfault detection in the e-stop circuit

## Features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508
- BN 5930.48/203 with cross fault detection by connecting 2 different phases, max. 400 V,  
BN 5930.48/204 with cross fault detection by connecting phase and neutral, max. 230 V
- Dual voltage version
- Emergency-stop circuit T12, T22:  
optionally for AC 110 V / DC 60 V or AC 230 V / DC 110 V
- Output: 3 NO, 1 NC contacts for AC 400 V
- 1-channel or 2-channel circuit
- LED displays for channel 1, 2 and mains
- Feedback circuit X1 - X2 for monitoring external contactors
- Removable terminal strips
- Width 100 mm

## Approvals and Markings

## Applications

Protection of persons and machines

- Emergency stop circuits on machines
- Monitoring safety gates

## Indicators

LED power supply: on when operating voltage present  
LED K1: on when supply on relay K1  
LED K2: on when supply on relay K2

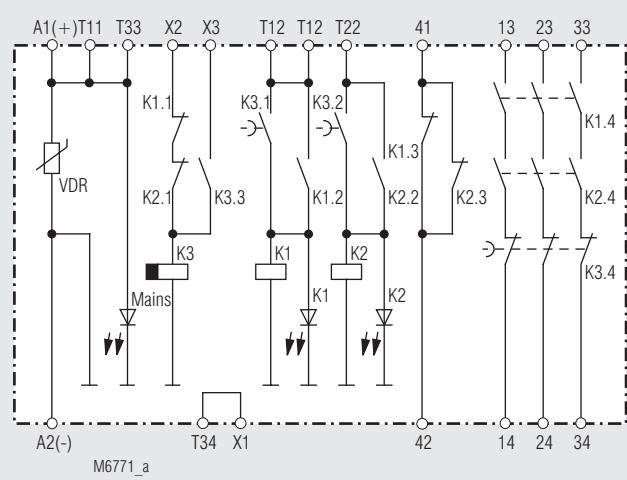

## Notes

One or more BN3081 extension modules or external contactors with positively driven contacts can be used for contact multiplication of the emergency stop module BN 5930.

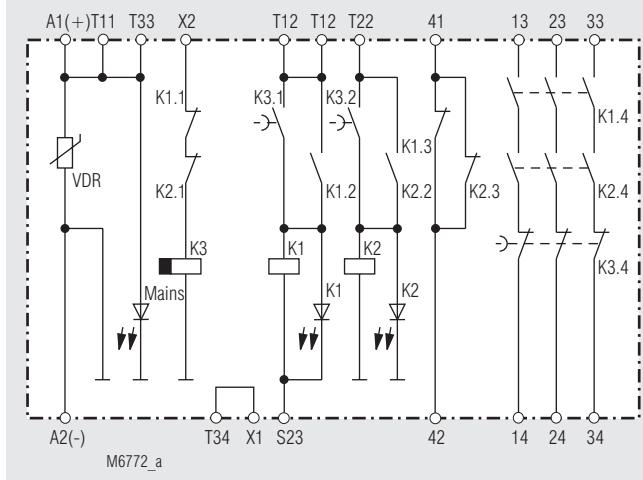

## Connection Terminals

Terminal designation	Signal description
A1 (+)	+ / L
A2 (-)	- / N
T12, T22, X1, X2, X3, S23	Control inputs
T11, PE(-), T33, T34	Control outputs
13, 14, 23, 24, 33, 34	Forcibly guided NO contacts for release circuit
41, 42	Forcibly guided indicator output

## Block Diagrams

BN 5930.48/203

BN 5930.48/204 (with cross fault detection)

## Technical Data

### Input

<b>Nominal voltage <math>U_N</math>:</b>	AC 110 V* / DC 60 V* or AC 230 V* / DC 110 V* over terminal A1 - A2 other voltages on request AC 0.85 ... 1.1 $U_N$ DC 0.9 ... 1.1 $U_N$ DC 0.85 ... 1.1 $U_N$
<b>Voltage range:</b> at 10% residual ripple:	AC 0.85 ... 1.1 $U_N$
at 48% residual ripple:	DC 0.9 ... 1.1 $U_N$
<b>Nominal consumption:</b>	approx. 3.9 VA at AC 230 V
<b>Nominal frequency:</b>	50 / 60 Hz
<b>Control voltage T12, T22:</b>	same as nominal voltage
<b>Control current:</b>	approx. 12 mA for K1 and K2 at AC 230 V
<b>Fusing of the device:</b>	internal with PTC

### Output

<b>Contacts</b> BN 5930.48:	3 NO, 1 NC contacts
--------------------------------	---------------------

The contacts 13...33 / 14...34 are safety contacts.  
The contact 41-42 can only be used for monitoring.

<b>Response / release time of K1 and K2:</b>	35 ms / 35 ms
<b>Release delay of K3:</b>	approx. 250 ms
<b>Contact type:</b>	relay, forcibly guided
<b>Output nominal voltage:</b>	AC 400 V / DC 230 V
<b>Thermal current <math>I_{th}</math>:</b>	see continuous current limit curve (max. 10 A in one contact path)
<b>Switching capacity</b> to AC 15:

Variant, if required  
Contacts  
Type

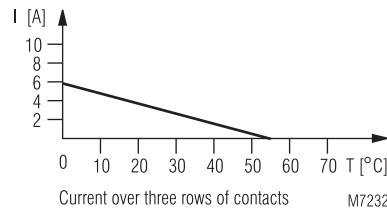

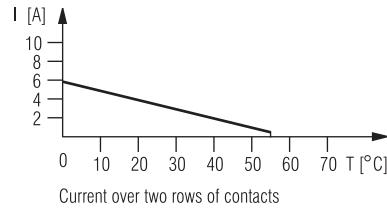

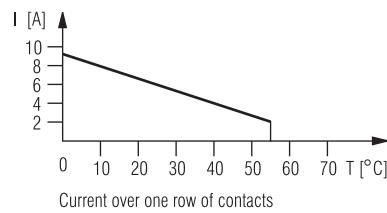

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	Power supply not connected
LED "K1" lights up, but "K2" remains off	- Safety relay K1 is welded (replace device) - A 1-channel switch-off occurred on T22 (switch channel off on T12)
LED "K2" lights up, but "K1" remains off	- Safety relay K2 is welded (replace device) - A 1-channel switch-off occurred on T12 (switch channel off on T22)
Device cannot be activated	- Safety relay is welded (replace device)

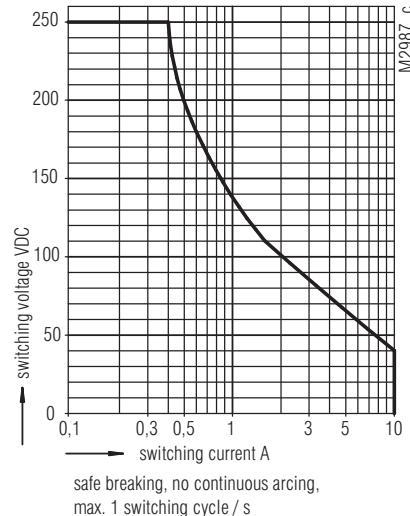

## Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristic

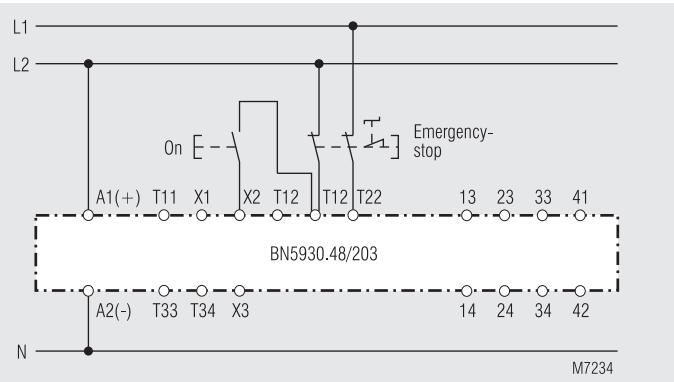

Continuous current limit curves depend on the ambient temperature

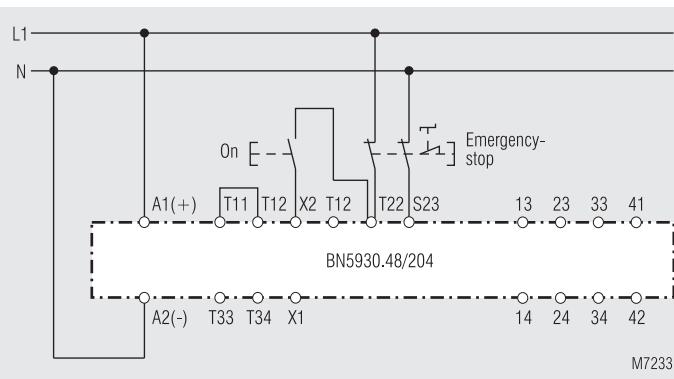

Limit curve for arc-free operation

## Application Examples

Two-channel emergency stop circuit. "Emergency stop" connected at two different phases, thereby giving "Cross fault detection".

Suited up to SIL3, Performance Level e, Cat. 4

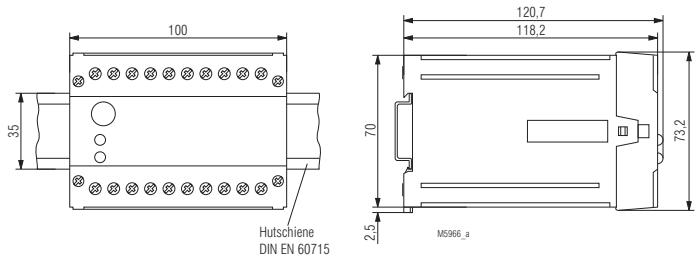

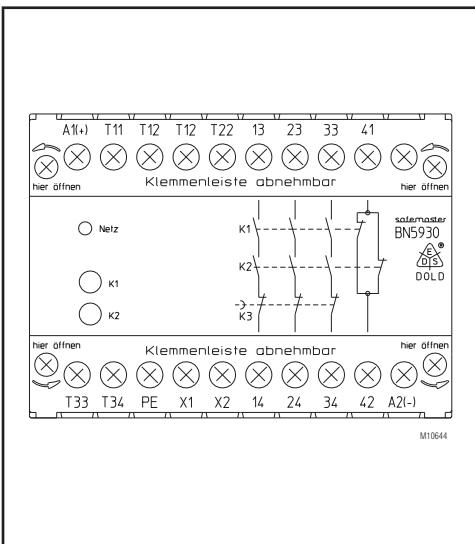

Two-channel emergency stop circuit with "Cross fault detection" in the alternating current network.

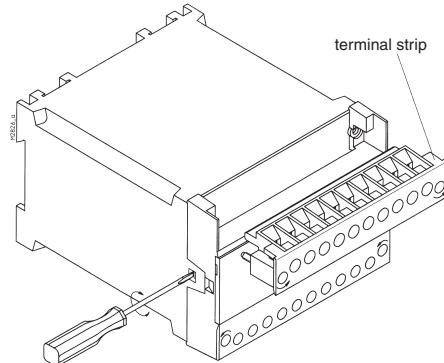

Suited up to SIL3, Performance Level e, Cat. 4

## SAFEMASTER Emergency Stop Module BN 5983

**DOLD**

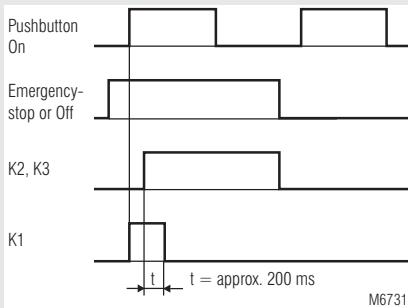

0221560

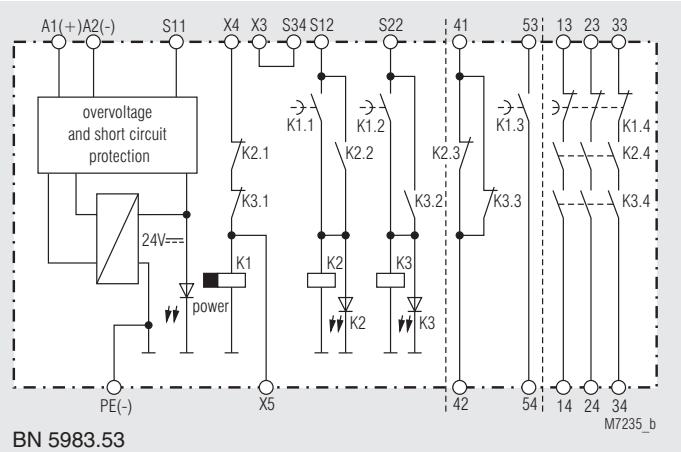

### • According to

- Performance Level (PL) e and category 4 to EN ISO 13849-1
- SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
- Safety Integrity Level (SIL) 3 to IEC/EN 61508
- Output: 3 NO, 1 NC contacts for AC 400 V
- Optionally gold-plated contacts to switch small loads (input for PLC)
- 1-channel or 2-channel connection
- LED displays for channels 1 and 2
- Feedback circuit X3 - X4 for monitoring external contactors
- Removable terminal strips
- Overvoltage and short circuit protection
- Width 100 mm

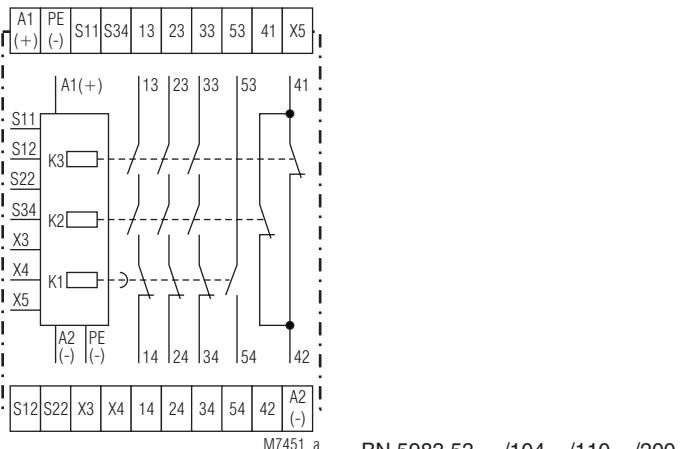

### Function Diagram

### Block Diagrams

### Circuit Diagrams

### Approvals and Markings

### Applications

- Protection of people and machines
- Emergency-stop circuits on machines
  - Monitoring of safety gates

### Indicators

- LED power supply: on when operating voltage present
- LED S12 / K2: on when supply on relay K2
- LED S22 / K3: on when supply on relay K3

### Notes

The PE terminal permits operation of the device in IT systems with insulation monitoring and also serves as a reference point for testing the control voltage. The internal short-circuit protection will be bridged on DC devices, if the protective ground is connected to terminal PE.

One or more extension modules BN 3081 or external contactors with forcibly guided contacts may be used to multiply the number of contacts of the emergency-stop module BN 5983.

### Connection Terminals

Terminal designation	Signal description
A1 (+)	+ / L
A2 (-)	- / N
S12, S22, S34, X3, X4, X5	Inputs
S11, PE(-)	Outputs
13, 14, 23, 24, 33, 34	Forcibly guided NO contacts for release circuit
41, 42, 53, 54	Forcibly guided indicator output

## Technical Data

### Input

<b>Nominal voltage <math>U_N</math>:</b>	AC 24, 42, 48, 110, 127, 230, 240 V DC 24, 48, 110 V
<b>Voltage range:</b>	AC 0.8 ... 1.1 $U_N$
at 10 % residual ripple:	DC 0.9 ... 1.2 $U_N$
at 48 % residual ripple:	DC 0.8 ... 1.1 $U_N$
<b>Nominal consumption:</b>	5 VA ± 30 %
<b>Nominal frequency:</b>	50 / 60 Hz
<b>Control voltage S11:</b>	DC 24 V
<b>Control current:</b>	max. DC 100 mA
<b>Minimum voltage at terminals S12, S22:</b>	DC 21 V with activated device

### Output

#### Contacts

BN 5983.53:	3 NO, 1 NC contacts 1 delay-release NO contact (K1.3)
The NO contacts 13...33 / 14...34 are safety contacts.	
<b>The NC contact 41-42 and the NO contact 53-54 can only be used for monitoring.</b>	

**Operate time:** 35 ms

**Release time**

opening in secondary circuit (S12-S22):  
30 ms ± 25 %

opening in supply circuit:  
100 ms ± 50 %

**Release delay of K1:** approx. 200 ms

**Contact type:** Relay, forcibly guided

**Nominal output voltage:** AC 400 V / DC 230 V

**Thermal current  $I_{th}$ :** see continuous current limit curve (max. 10 A in one contact path)

**Switching capacity to AC 15:**

NO contacts : 5 A / AC 230 V IEC/EN 60 947-5-1  
NC contacts: 2 A / AC 230 V IEC/EN 60 947-5-1

to DC 13: NO contacts : 4 A / DC 24 V IEC/EN 60 947-5-1  
NC contacts: 4 A / DC 24 V IEC/EN 60 947-5-1

**Electrical life**

to AC 15 at 2 A, AC 230 V:  
10<sup>5</sup> switching cycles IEC/EN 60 947-5-1  
to DC 13 at 2 A, DC 24 V:  
> 240 x 10<sup>3</sup> switching cycles

**Permissible operating frequency:**

**Short circuit strength** max. fuse rating

NO contact: 10 A gL IEC/EN 60 947-5-1  
NC contact: 6 A gL IEC/EN 60 947-5-1

**Mechanical life:**

10 x 10<sup>6</sup> switching cycles

### General Data

**Operating mode:** Continuous operation

**Temperature range** operation:  
- 15 ... + 55°C  
storage : at max. 90 % humidity  
altitude: - 25 ... + 85 °C  
< 2.000 m

**Clearance and creepage distances**

**EMC**  
Interference suppression:  
**Degree of protection**

Housing: IP 40 IEC/EN 60 529  
Terminals: IP 20 IEC/EN 60 529  
Housing: Thermoplastic with V0 behaviour according to UL subject 94

**Vibration resistance:** Amplitude 0.35 mm IEC/EN 60 068-2-6  
frequency: 10 ... 55 Hz

**Climate resistance:** 15 / 055 / 04 IEC/EN 60 068-1  
**Terminal designation:** EN 50 005

**Wire fixing:** Flat terminals with self-lifting clamping piece IEC/EN 60 999-1  
Removable terminal strip

**Mounting:** DIN rail IEC/EN 60 715  
**Weight:** 840 g

### Dimensions

**Width x height x depth:** 100 x 74 x 121 mm

## UL-Data

**Nominal voltage  $U_N$ :** AC 110, 127, 230 V  
DC 24 V

**Ambient temperature:** - 15 ... + 55 °C

**Switching capacity:** 3 A, 250 Vac G.P.

**Wire connection:** 60°C / 75°C copper conductors only  
AWG 16 - 14 Torque 7 lb in

Technical data that is not stated in the UL-Data, can be found in the technical data section.

## CCC-Data

**Nominal voltage  $U_N$ :** AC 24, 42, 48, 110, 127, 230 V  
DC 24, 48, 110 V

**Thermal current  $I_{th}$ :** see continuous current limit curve (max. 5 A in one contact path)

Technical data that is not stated in the CCC-Data, can be found in the technical data section.

## Standard Type

BN 5983.53 DC 24 V

Article number: 0032155

- **Output:** 3 NO, 1 NC contacts
- **Nominal voltage  $U_N$ :** DC 24 V
- **Width:** 100 mm

## Variants

### BN 5983.53/104:

For switching small loads of 1 mVA ... 7 VA or 1 mW ... 7 W in the ranges 0.1 ... 60 V and 1 ... 300 mA.

The device is also suitable for switching the maximum switching current. However, this will burn off the gold plating of the contacts, so that switching of small loads is no longer possible afterwards.

### BN 5983.53/110:

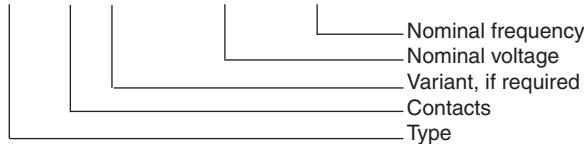

To avoid latching problems in the case of short voltage drops K2 and K3 are switched definitely off before reset.

### BN 5983.53/200:

Redundant switching off with device diversity. Device diversity means that safety relays from different production batches or from different manufacturers are used.

## Ordering example for Variants

BN 5983 .53 / \_ \_ \_ AC 230 V 50/60 Hz

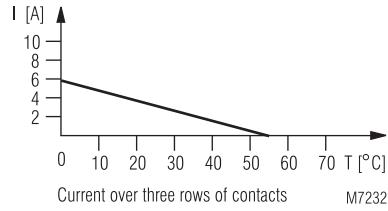

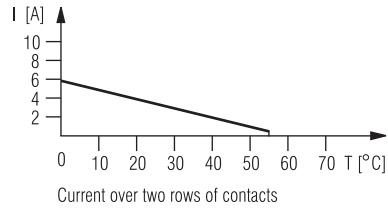

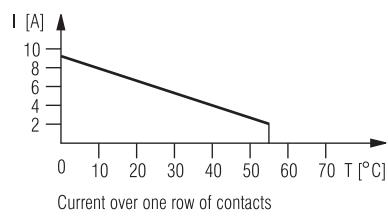

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	Power supply not connected
LED "S22/K3" lights up, but "S12/K2" remains off	- Safety relay K3 is welded (replace device) - A 1-channel switch-off occurred on S12 (switch channel off on S22)
LED "S12/K2" lights up, but "S22/K3" remains off	- Safety relay K2 is welded (replace device) - A 1-channel switch-off occurred on S22 (switch channel off on S12)
Device cannot be activated	- Safety relay is welded (replace device) - Safety relay K1 via X5 energized

## Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

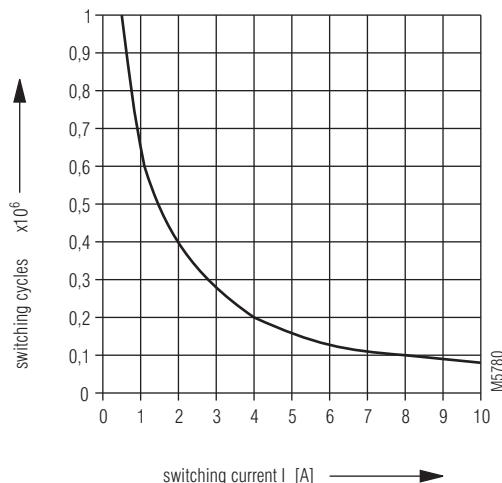

## Characteristics

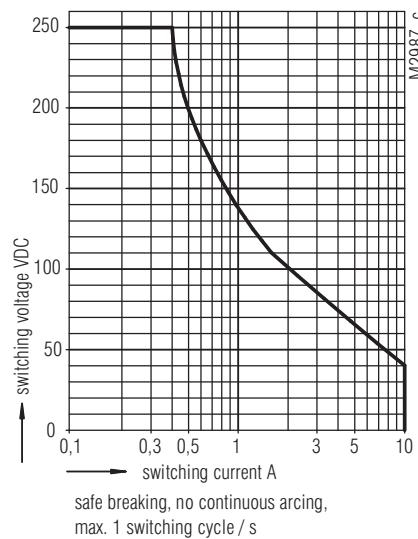

M7232

Continuous current limit curves  
as a function of ambient temperature

electric life DC13 24V DC /  $t_{on}$  0,4s;  $t_{off}$  9,6s  
2 contacts in series

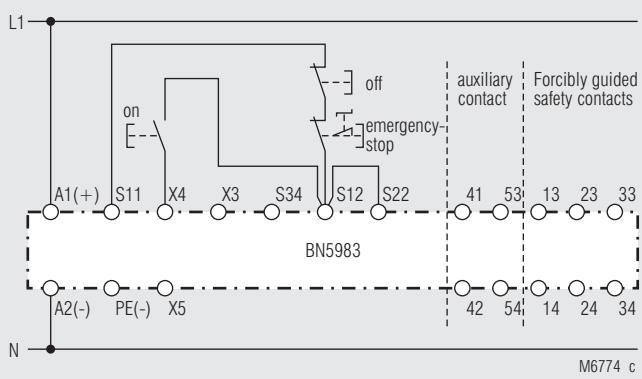

Contact service life

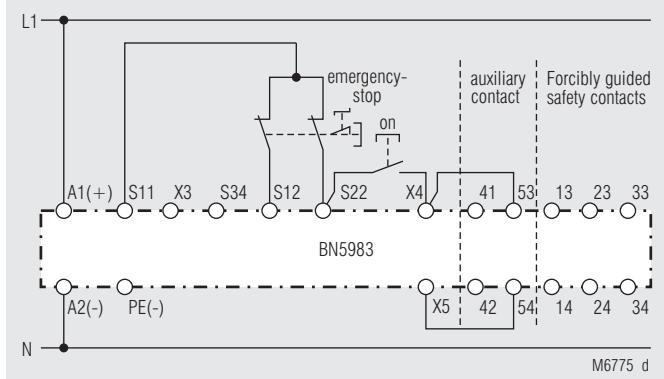

Limit curve for arc-free operation with resistive load

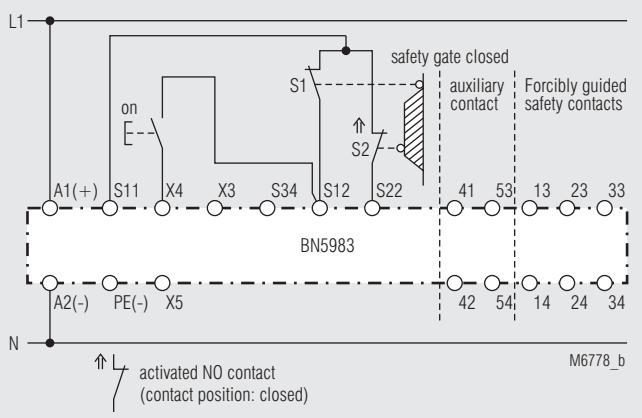

## Application Examples

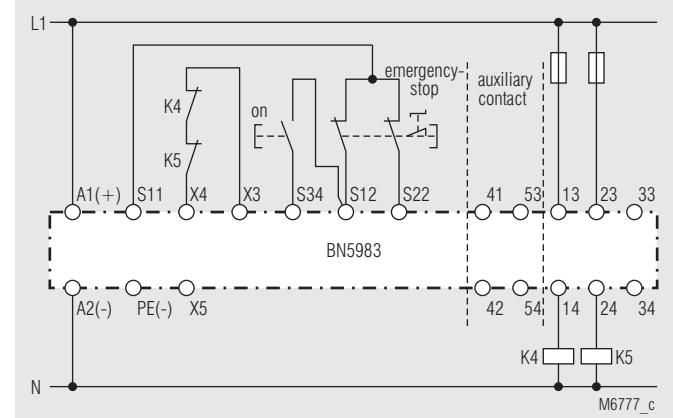

One-channel emergency-stop circuit. This circuit does not have any redundancy in the emergency-stop control circuit.  
Suited up to SIL2, Performance Level d, Cat. 3

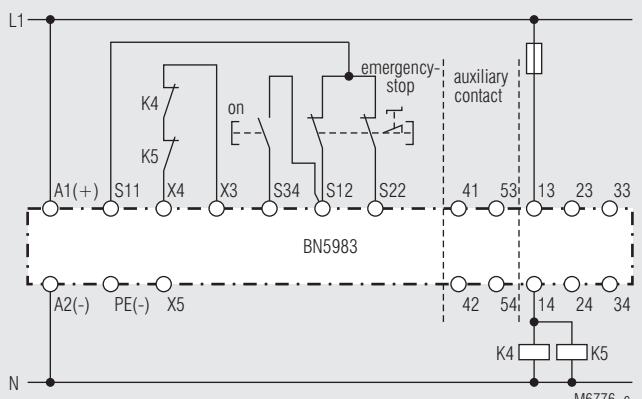

Two-channel emergency stop circuit with line fault detection on start button. The unit starts with the negative edge of the start signal (contrary to the function diagram).  
If line fault detection is not necessary the links X4-53 and X5-54 can be removed.  
Suited up to SIL3, Performance Level e, Cat. 4

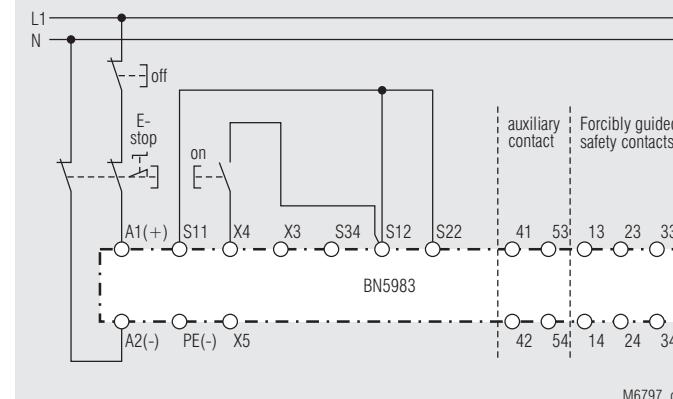

Two-channel monitoring of a safety gate.  
Suited up to SIL3, Performance Level e, Cat. 4

Contact reinforcement by external contactors, 2-channel.  
The output contacts can be reinforced by external contactors with forcibly guided contacts for switching currents > 10 A. Functioning of the external contactors is monitored by looping the NC contacts into the closing circuit (terminals X3 - X4).  
Suited up to SIL3, Performance Level e, Cat. 4

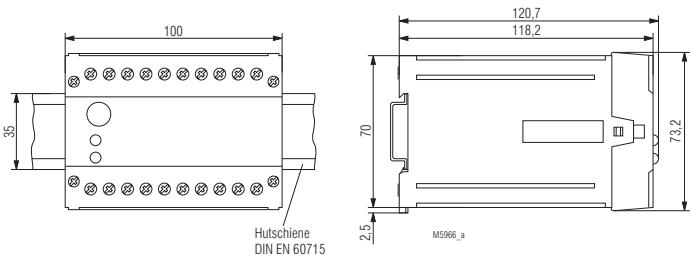

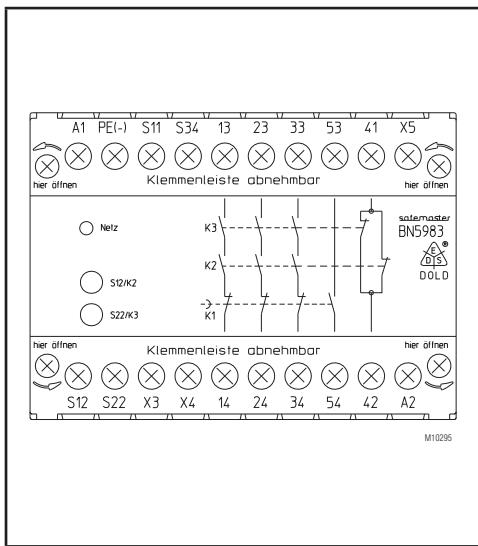

Contact reinforcement by external contactors with reduced safety level.  
Suited up to SIL3, Performance Level e, Cat. 4

Two-pole emergency-stop circuit with emergency stop control device in supply circuit.  
Application for long emergency stop loops where the control voltage drops below the minimum voltage of 21 V.  
**Attention:**  
Single faults (e.g. line faults at the emergency stop control device) are not detected with this external circuit configuration.  
Suited up to SIL3, Performance Level e, Cat. 4

## Unit Programming

Disconnect unit over switch S2.

Drawing shows setting at the state of delivery

### Notes

Line fault detection on On-button:

The line fault detection is only active when S12 and S22 are switched simultaneously. If the On-button is closed before S12, S22 is connected to voltage (also when line fault across On-Button), the output contacts will not close.

A line fault across the On-button which occurred after activation of the relay, will be detected with the next activation and the output contacts will not close. If a line fault occurs after the voltage has been connected to S12, S22, the unit will be activated because this line fault is similar to the normal On-function. (Cross fault detection between terminals S12-S22)

The terminal S21 permits the operation of the device in IT-systems with insulation monitoring, serves as a reference point for testing the control voltage and is used to connect the E-stop loop when cross fault monitoring is selected.

Connecting the terminal S21 to the protective ground bridges the internal short-circuit protection of Line A2 (-). The short-circuit protection of line A1 (+) remains active.

## Technical Data

### Input

<b>Nominal voltage <math>U_N</math>:</b>	DC 24 V

**DOLD** 

0264281

LG 5925/900

#### Function Diagram

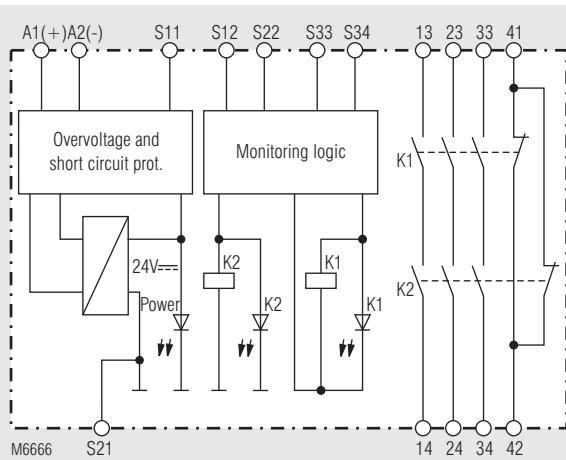

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508 and IEC/EN 61511
- According to EN 50156-2 for furnaces
- to connect:
  - safety switch NE 5020
  - safety switch NE 5021
- Output: max. 4 NO contacts, see contacts
- 1- or 2-channel operation
- Line fault detection on On-button
- Manual restart or automatic restart, switch S2
- with or without cross fault monitoring switch S1
- LED indicator for state of operation
- LED indicator for channel 1 and 2
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled, or 2 x 2.5 mm<sup>2</sup> solid DIN 46 228-1/-2/-3/-4
- As option with plugable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width 22.5 mm

#### Approvals and Markings

#### Block Diagram

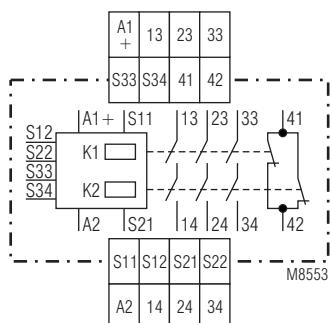

#### Indicators

- upper LED: on, when supply connected  
lower LEDs: on, when relay K1 and K2 energized

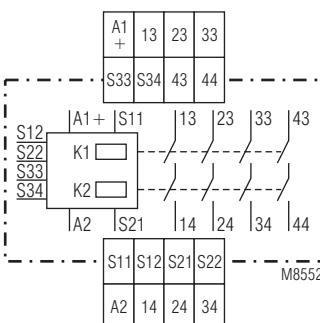

#### Notes

Line fault detection on On-button:  
The line fault detection is only active when S12 and S22 are switched simultaneously. If The On-button is closed before S12, S22 is connected to voltage (also when line fault across On-Button), the output contacts will not close. A line fault across the On-button which occurred after activation of the relay, will be detected with the next activation and the output contacts will not close.

## Dimensions

### Width x height x depth

LG 5925/920: 22.5 x 90 x 121 mm

LG 5925/920 PC: 22.5 x 111 x 121 mm

LG 5925/920 PS: 22.5 x 104 x 121 mm

## Standard Type

LG 5925.48/920 DC 24 V

Article number:

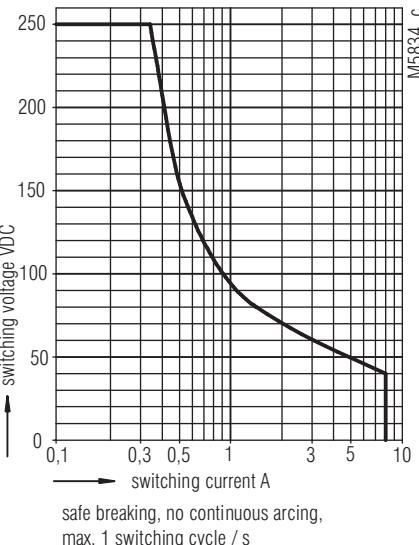

- Output: 0063683
- Nominal voltage  $U_N$ : 3 Schließer, 1 Öffner
- Width: DC 24 V
- Width: 22.5 mm

## Ordering Example

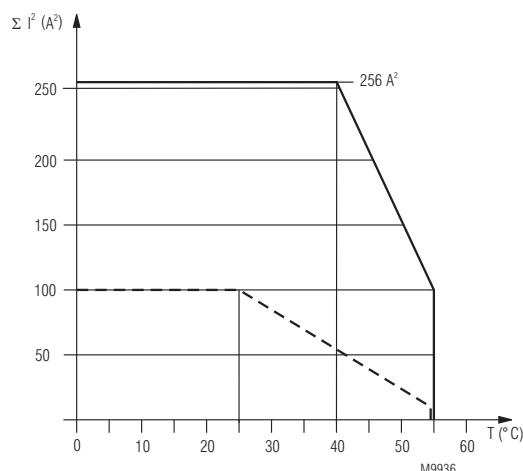

LG 5925 . . . /920 DC 24 V

- Nominal voltage
- Type of terminals without indication: terminal blocks fixed, with screw terminals
- PC (plugin cage clamp): plugable terminal blocks with cage clamp terminals
- PS (plugin screw): plugable terminal blocks with screw terminals
- Contacts
- Type

## Characteristics

Arc limit curve under resistive load

## Troubleshooting

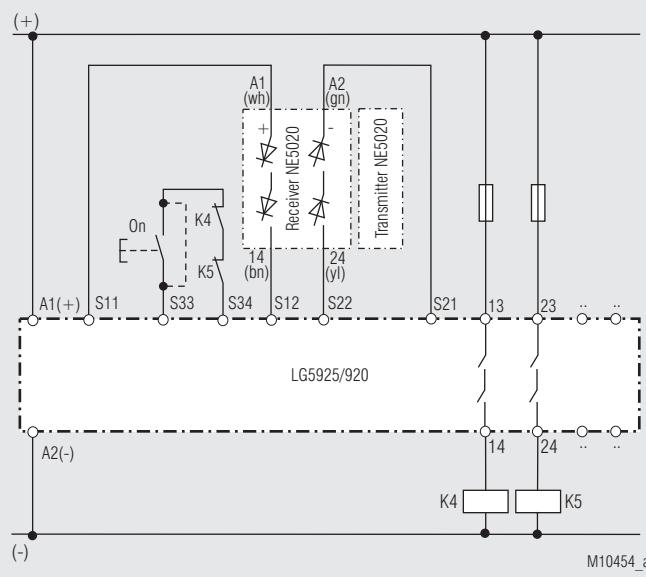

Failure	Potential cause
LED "Power" does not light up	- Power supply not connected
LED "K1" lights up, but "K2" remains off	- Safety relay K1 is welded (replace device) - A 1-channel switch-off occurred on S12 (switch channel off on S22)
LED "K2" lights up, but "K1" remains off	- Safety relay K2 is welded (replace device) - A 1-channel switch-off occurred on S22 (switch channel off on S12)
Device cannot be activated	- Safety relay K2 is welded (replace device) - Incorrect setting of switch S2 - Manual start mode: Line fault on start-button (disconnect power supply and remove fault) - Automatic start mode: S33-S34 not bridged

## Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

Total current limit curve

## Application Examples

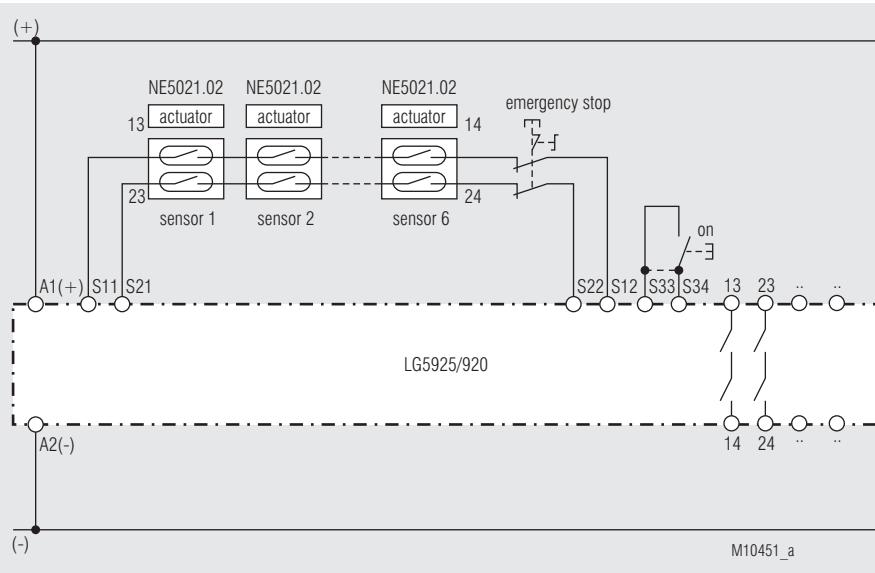

With safety switch NE 5020. Contact reinforcement by external contactors. 2-channel operation, cross fault detection

**Please note:** Refer to „Unit programming“!

Switches in position:  
S1 cross fault detection  
S2 manual start

With autostart link On-button and set S2 to „automatic“.

Suited up to SIL3, Performance Level e, Cat. 4

6 safety switches NE 5021 + 1 E-stop button in series. 2-channel operation, cross fault detection

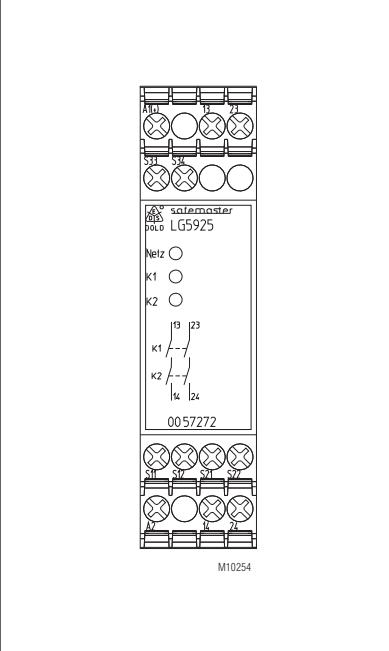

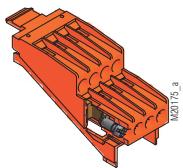

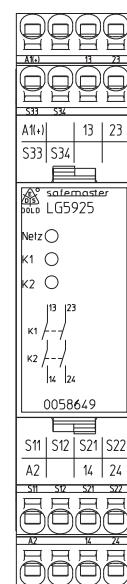

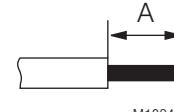

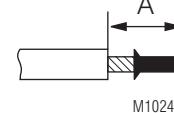

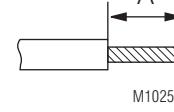

**Please note:** Refer to „Unit programming“!

Switches in position:  
S1 cross fault detection  
S2 manual start

With autostart link On-button and set S2 to „automatic“.

Suited up to SIL3, Performance Level e, Cat. 3

## SAFEMASTER Emergency Stop Module BN 5930.48

**DOLD** 

- same as BN 5983, but with other terminal designation (see circuit diagram)
- **According to**
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508
- Output: 3 NO, 1 NC contacts for AC 400 V
- 1-channel or 2-channel circuit
- LED displays for channel 1, 2 and mains
- Feedback circuit X1 - X2 for monitoring external contactors
- Removable terminal strips
- Width 100 mm

### Function Diagram

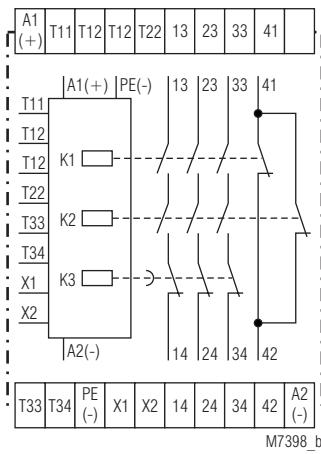

### Approvals and Markings

### Applications

- Protection of persons and machines
- Emergency stop circuits on machines
  - Monitoring safety gates

### Circuit Diagram

### Notes

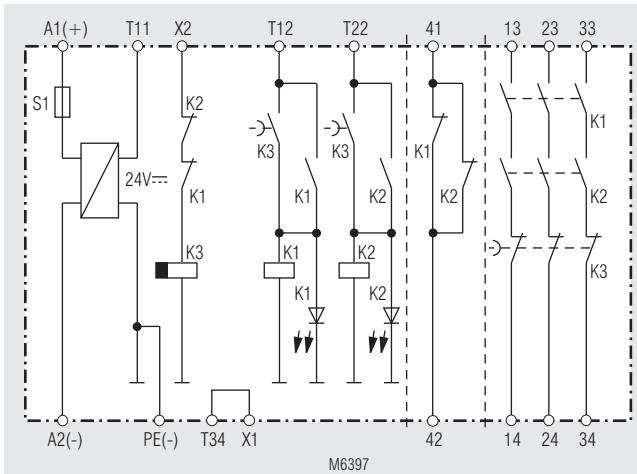

The PE terminal permits operation of the device in IT systems with insulation monitoring and also serves as a reference point for testing the control voltage.

One or more extension modules BN 3081 or external contactors with positively-driven contacts may be used to multiply the number of contacts of the emergency-stop module BN 5930.

### Connection Terminals

Terminal designation	Signal description
A1 (+)	+ / L
A2 (-)	- / N
T12, T22, X1, X2	Inputs
T11, PE(-), T34	Outputs
13, 14, 23, 24, 33, 34	Forcibly guided NO contacts for release circuit
41, 42	Forcibly guided indicator output

## Block Diagrams

## Technical Data

### Clearance and creepage distances

## Dimensions

Width x height x depth: 100 x 74 x 121 mm

### Standard Type

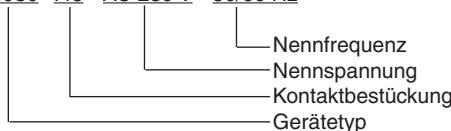

BN 5930.48 DC 24 V

Article number: 0041438

- Output: 3 NO contacts, 1 NC contact for AC 400 V
- Nominal voltage  $U_N$ : DC 24 V
- Width: 100 mm

### Ordering Example

BN 5930 .48 AC 230 V 50/60 Hz

### Troubleshooting

Failure	Potential cause
LED "Power" does not light up	Power supply not connected
LED "K1" lights up, but "K2" remains off	- Safety relay K1 is welded (replace device) - A 1-channel switch-off occurred on T22 (switch channel off on T12)
LED "K2" lights up, but "K1" remains off	- Safety relay K2 is welded (replace device) - A 1-channel switch-off occurred on T12 (switch channel off on T22)
Device cannot be activated	- Safety relay is welded (replace device)

### Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Technical Data

### Input

Nominal voltage  $U_N$ :

AC 24, 48, 110, 127, 230, 240 V \*

DC 24 V \*

\* see device label

### Voltage range:

at 10 % residual ripple:

AC 0.8 ... 1.1  $U_N$

at 48 % residual ripple:

DC 0.9 ... 1.2  $U_N$

### Nominal consumption:

DC 0.8 ... 1.1  $U_N$

5 VA ± 30 %

### Nominal frequency:

50 / 60 Hz

### Control voltage S11:

DC 24 V

### Control current:

max. DC 100 mA

### Minimum voltage at terminals T33, T34:

DC 21 V with activated device

### Output

#### Contacts

BN 5930.48:

3 NO, 1 NC contacts  
1 delay-release NO contact (K1.3)

The NO contacts 13...33 / 14...34 are safety contacts.

The NC contact 41-42 can only be used for monitoring.

Operate time:  
Release time  
opening in secondary circuit (T33 - T34):  
opening in supply circuit:

35 ms

30 ms ± 25 %

100 ms ± 50 %

approx. 200 ms

Release delay of K3:

Relay, positively-driven

Contact type:

AC 400 V / DC 220 V

Nominal output voltage:

AC 10 A cos φ 1 .. 0,7, DC 10 A (see arc limit curve under resistive load)

Switching capacity:

see continuous current limit curve

Thermal current  $I_{th}$ :  
Switching capacity

to AC 15:

NC contact:

see continuous current limit curve

Switching capacity max.:

Electrical life

to AC 15 at 2 A, AC 230 V:

10<sup>5</sup> switching cycles IEC/EN 60 947-5-1

Permissible operating frequency:

6 000 switching cycles / h

Short circuit strength

max. fuse rating:

10 A gL

IEC/EN 60 947-5-1

max. line circuit breaker:

C 10 A

IEC/EN 60 947-5-1

Mechanical life:

10 x 10<sup>6</sup> switching cycles

## General Data

### Operating mode:

Continuous operation

### Temperature range

Operation: - 15 ... + 55 °C

Storage:

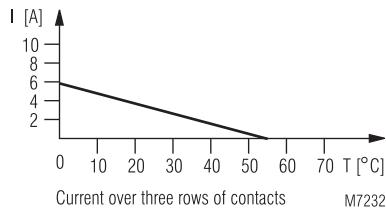

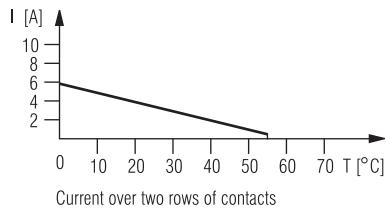

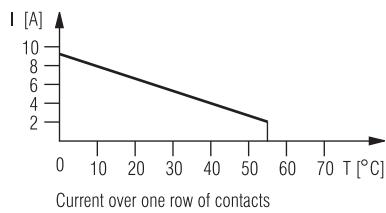

at max. 90 % humidity

Altitude:

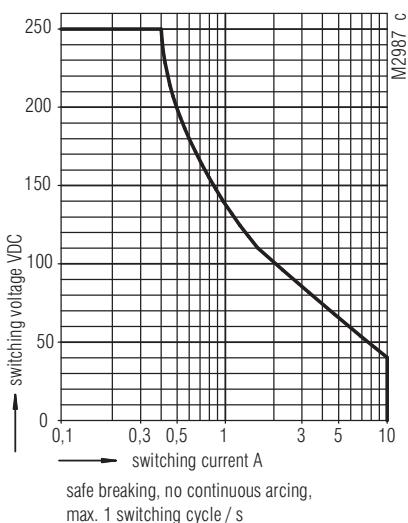

- 25 ... + 85 °C

< 2.000 m

## Characteristic

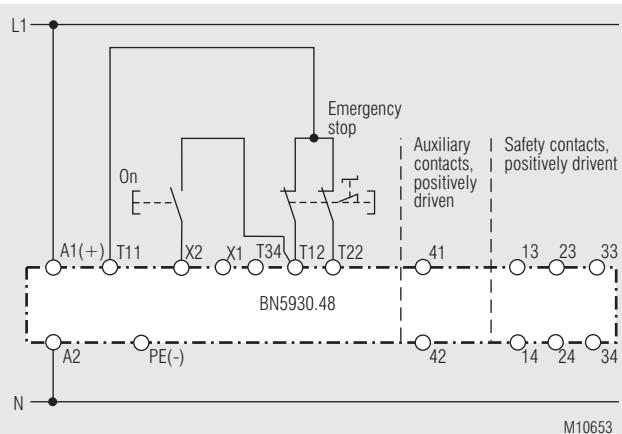

Continuous current limit curves depend on the ambient temperature

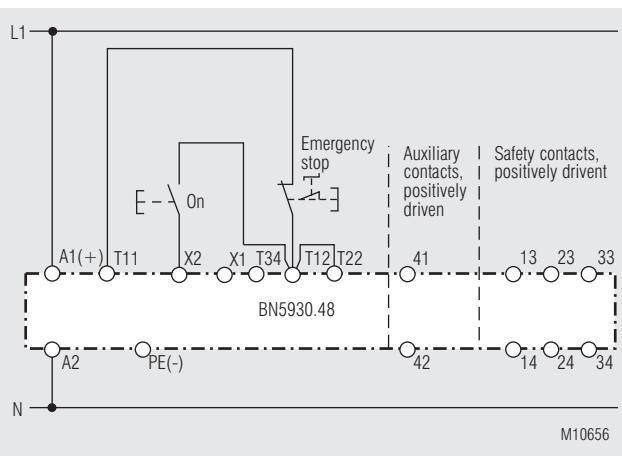

Limit curve for arc-free operation

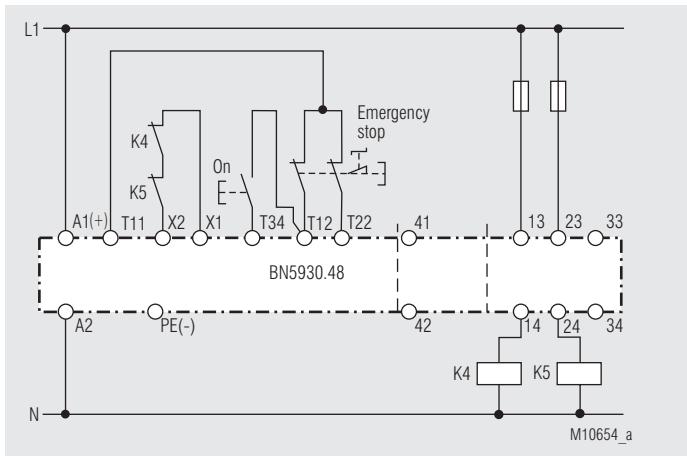

## Application Examples

Two-channel emergency stop circuit  
Suited up to SIL3, Performance Level e, Cat. 4

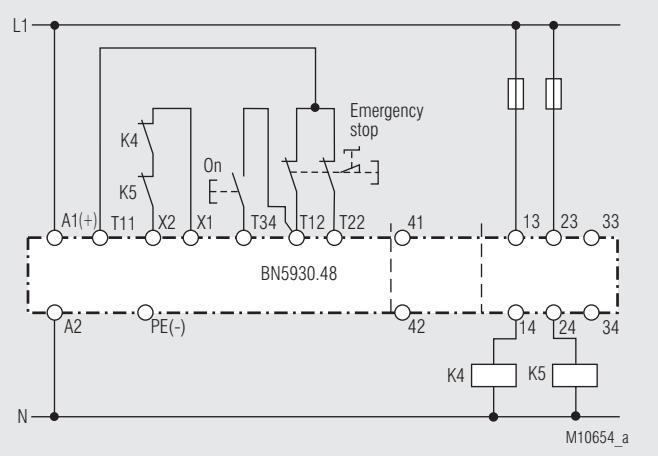

One-channel emergency-stop circuit. This circuit does not have any redundancy in the emergency-stop control circuit.  
Suited up to SIL2, Performance Level d, Cat. 3

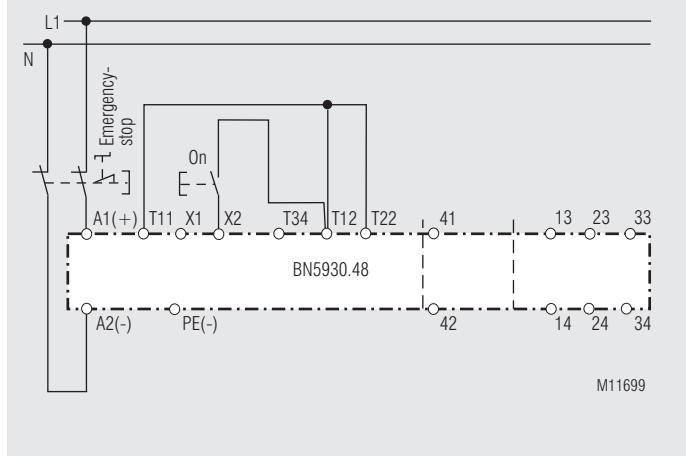

Contact reinforcement by external contactors, 2-channel.  
The output contacts can be reinforced by external contactors with positively driven contacts for switching currents > 10 A. Functioning of the external contactors is monitored by looping the NC contacts into the closing circuit (terminals X1 - X2).  
Suited up to SIL3, Performance Level e, Cat. 4

## Application Examples

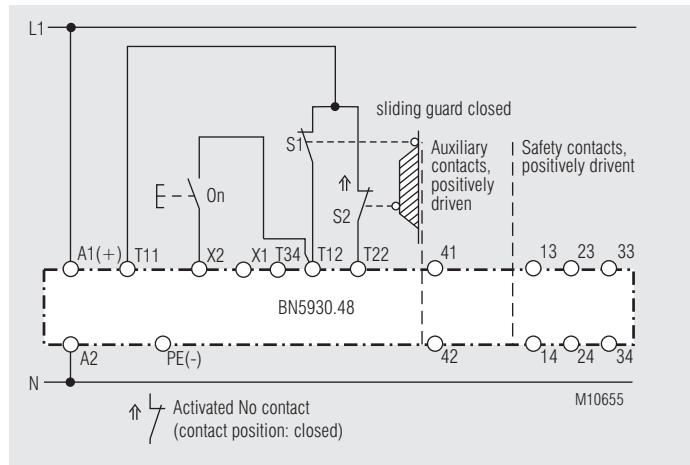

Contact reinforcement by external contactors with reduced safety level.  
Suited up to SIL3, Performance Level e, Cat. 4

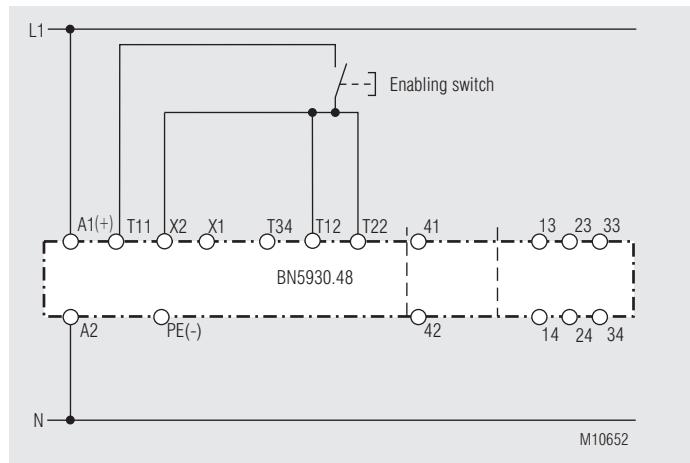

Two-pole emergency-stop with emergency-stop control device in the supply circuit..

Application for long emergency-stop loops in which the control voltage dropped below the minimum voltage of 21 V.

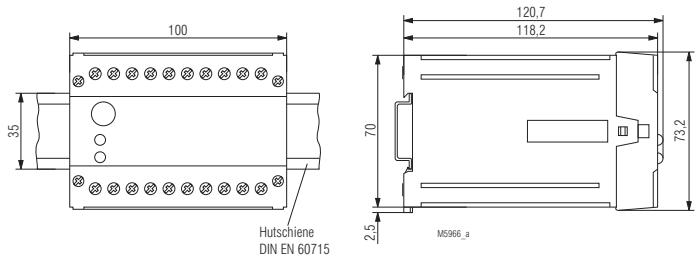

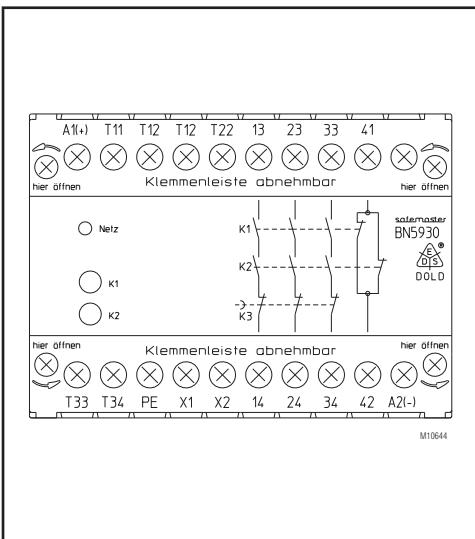

Two-channel monitoring of a safety gate.  
Suited up to SIL3, Performance Level e, Cat. 4

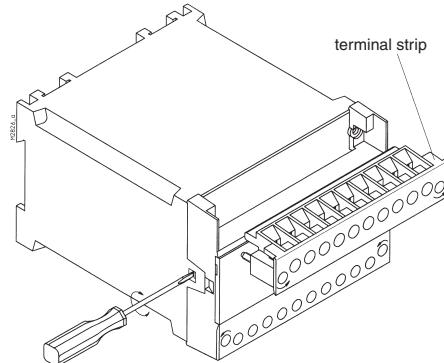

Emergency stop circuit with control of enabling switch.  
Suited up to SIL1, Performance Level c, Cat. 1

## SAFEMASTER Emergency Stop Module BO 5988

**DOLD** 

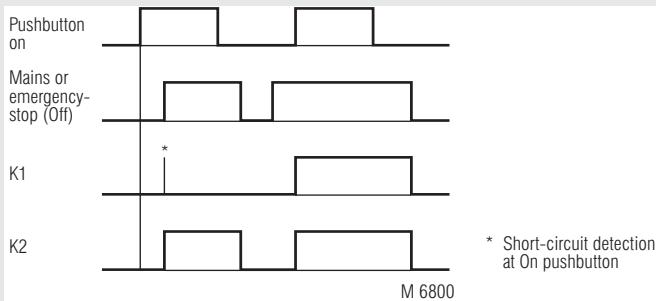

0221562

### • According to

- Performance Level (PL) e and category 4 to EN ISO 13849-1
- SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
- Safety Integrity Level (SIL) 3 to IEC/EN 61508
- Output: max. 6 NO, 1 NC contacts or 1 NO contact for AC 250 V
- 1-channel or 2-channel connection
- Line fault detection at On pushbutton
- Feedback circuit X1-X2 for monitoring external contactors
- Integrated short-circuit and overvoltage protection
- LED displays for channels 1 and 2 and supply
- Removable terminal strips
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled (isolated), DIN 46 228-1/-2/-3-4 or 2 x 2.5 mm<sup>2</sup> stranded ferruled DIN 46 228-1/-2/-3
- Optionally with release delayed NO contact to 10 min
- Optionally automatic On function after connection of operating voltage or activation via On pushbutton
- Optionally cross fault detection in emergency stop control circuit
- Optionally dual voltage version
- Width 100 mm

### Function Diagram

### Approvals and Markings

## Notes

Jumper assignment for functions:

Activation via On pushbutton / or automatic On function

On push-button Y1 - Y2	Jumper X5 - X6	Function
		The output contacts are switches only after operation of the On pushbutton. Line fault monitoring at the On pushbutton
M8687	• — •	Automatic On function for operating voltage Off/On or after emergency stop release

Line fault detection at the On pushbutton:

The output contacts cannot be closed if the On pushbutton is already closed before the voltage is applied to S12, S22 (also in the event of a line fault at the On pushbutton).

A line fault at the On pushbutton which occurs after activation of the device is recognized when switching-on takes place again and closing of the output contacts is then prevented.

If a line fault occurs at the On pushbutton after the voltage is already present at S12, S22, undesired activation will take place, because this line fault does not differ from the normal closing function.

The gold-plated contacts of the BO 5988 also mean that this module is suitable for switching small loads of 1 mVA ... 7 VA, 1 mW ... 7 W in the range 0.1 ... 60 V, 1 ... 300 mA. The contacts also permit the maximum switching current. However, since the gold plating is burnt off at this current level, the device is no longer suitable for switching small loads after this. The PE terminal permits operation of the device in IT systems with insulation monitoring and also serves as a reference point for testing the control voltage. The internal short-circuit protection will be bridged on DC devices, if the protective ground is connected to terminal PE.

One or more extension modules BN 3081 or external contactors with forcibly guided contacts may be used to multiply the number of contacts of the emergency stop module BO 5988.

## Technical Data

### Input

#### Nominal voltage $U_N$

BO 5988.--/00:

	DC 24 V + AC 230 V
	DC 24 V + AC 240 V
	either DC 24 is connected to A3-A4 or the AC voltage to A1-A2

### Ambient temperature:

- 15 ... + 50 °C

**Wire connection:** 60°C / 75°C copper conductors only AWG 18 - 16 Torque 7 lb in

Technical data that is not stated in the UL-Data, can be found in the technical data section.

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	- Power supply not connected
LED "K2" lights up, but "K3" remains off	- Safety relay K2 is welded (replace device) - A 1-channel switch-off occurred on S12 (switch channel off on S22 e.g. S23)
LED "K3" lights up, but "K2" remains off	- Safety relay K3 is welded (replace device) - A 1-channel switch-off occurred on S22 e.g. S23 (switch channel off on S12)
Device cannot be activated	- The delay contacts are not yet switched off - Safety relay is welded (replace device) - Feedback circuit X1 - X2 not closed - Manual start mode: Line fault on start-button (disconnect power supply and remove fault) - Automatic start mode: S13-S14 are not bridged

## Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Standard Types

BO 5988.61/024 DC 24 V + AC 230 V 50 / 60 Hz  
Article number: 0040375

- Dual voltage version
- Output: 6 NO contacts, 1 NC contact as monitoring contact
- Width: 100 mm

BO 5988.47/124 DC 24 V + AC 230 V 50 / 60 Hz 1 ... 10 s  
Article number: 0040430

- Dual voltage version
- Output: 3 NO contacts, 1 NC contact as monitoring contact, 1 release delayed NO contact
- With adjustable time delay  $t_v$  to 10 s
- Width: 100 mm

## Variants

BO 5988.\_/\_61: with UL approval (Canada/USA)

Auxiliary supply is not necessary during elapse of time:

BO 5988.47 / 1 \_/\_: 3 NO / 1 NC contacts +  $t_v$  adjustable

BO 5988.47 / 2 \_/\_: 3 NO / 1 NC contacts +  $t_v$  fixed

Auxiliary supply must be connected during elapse of time:

BO 5988.47 / 4 \_/\_: 3 NO / 1 NC contacts +  $t_v$  adjustable

BO 5988.47 / 5 \_/\_: 3 NO / 1 NC contacts +  $t_v$  fixed

Without time delay  $t_v$ :

BO 5988.61 / 0 \_/\_: 6 NO / 1 NC contacts as monitoring contact

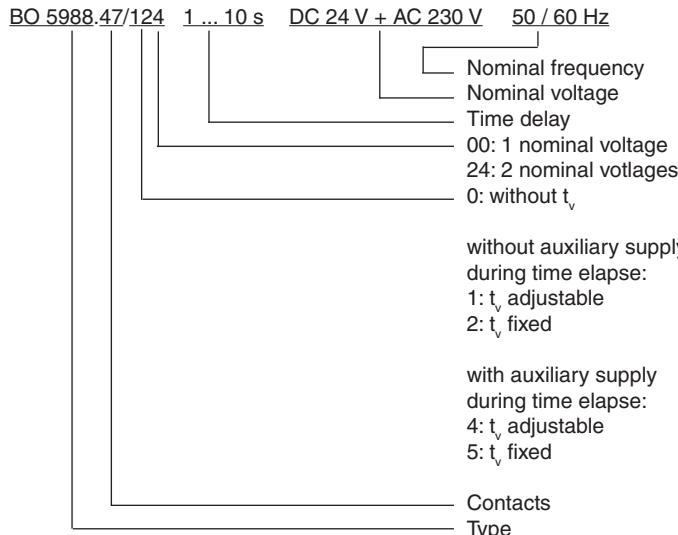

BO 5988.62 / 0 \_/\_: 6 NO / 1 NC contacts as monitoring contact

BO 5988.\_/\_ / 00: single voltage model

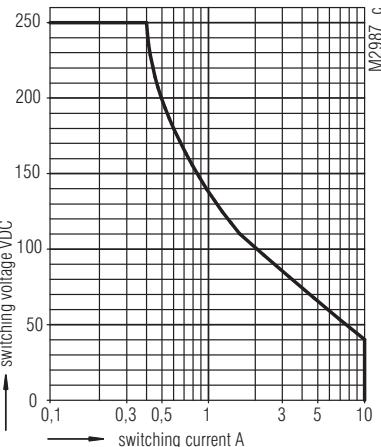

BO 5988.\_/\_ / 24: dual voltage model

BO 5988.61 / 324: Dual voltage model 0.5 s operate delay with automatic restart

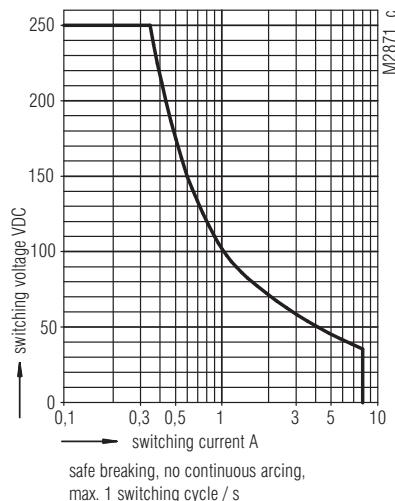

## Ordering example for variants

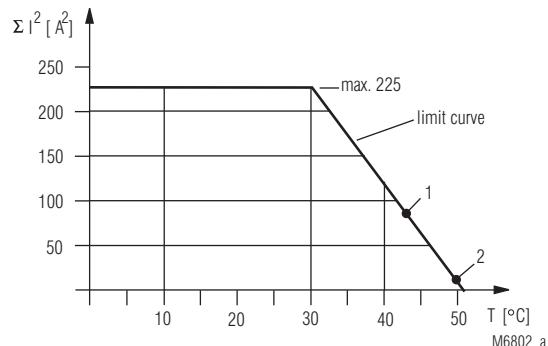

## Characteristics

Limit curve for arc-free operation with resistive load (instantaneous contact)

Limit curve for arc-free operation with resistive load (delayed contacts)

### Total current limit curve

It is necessary to use the square of the currents in order to obtain a linear limit curve.

### General formula for determination of the maximum ambient temperature

- Sum of currents<sup>2</sup> per safety contact = value on scale  $\Sigma I^2 (A^2)$
- Max. ambient temperature  $T$  = Cross point of scale  $\Sigma I^2 (A^2)$  with limit curve

### Example 1

- $(4A)^2 + (4A)^2 + (4A)^2 + (4A)^2 + (4A)^2 = 96 A^2$  (Scale  $\Sigma I^2$ )
- Max. ambient temperature  $T = 43^\circ C$  (point 1)

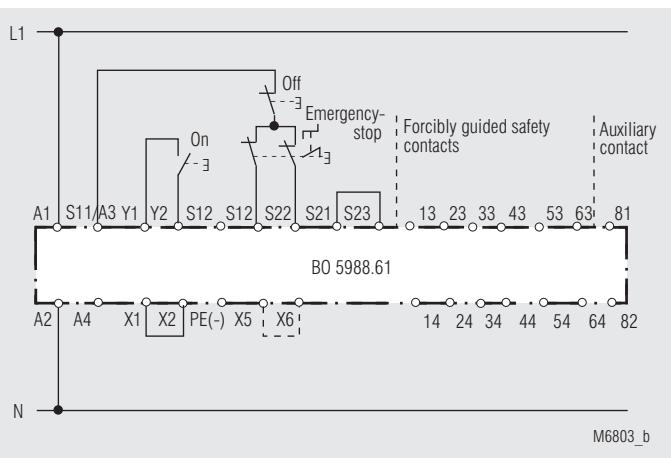

### Example 2

- $(0.5 A)^2 + (1 A)^2 + (2 A)^2 + (1 A)^2 = 6.25 A^2$  (Scale  $\Sigma I^2$ )
- Max. ambient temperature  $T = 49^\circ C$  (point 2)

### Please note:

The total current<sup>2</sup> can still be 1.5 A<sup>2</sup> at 50°C, i.e. 0.5 A per safety contact  
 A)  $(0.5 A)^2 + (0.5 A)^2 + (0.5 A)^2 + (0.5 A)^2 + (0.5 A)^2 = 1.5 A^2$   
 B) Max. ambient temperature = 50°C

## Application Examples

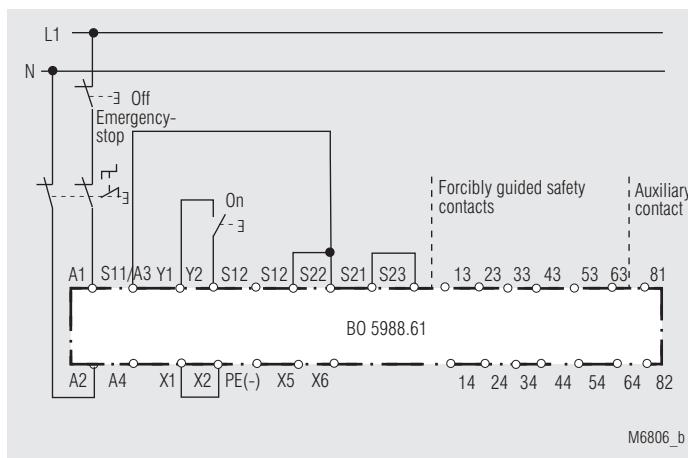

Two-channel emergency stop circuit without cross fault detection.

Activation via On pushbutton. - - - Jumper X5 - X6:

A jumper must be fitted X5 - X6 for the automatic On function.

The On pushbutton is not required

Suited up to SIL3, Performance Level e, Cat. 4

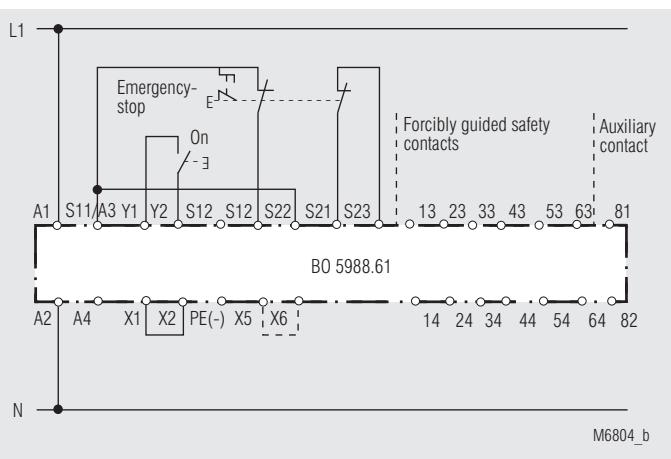

Two-pole emergency stop circuit with emergency stop control device in the supply circuit.

Application for long emergency stop loops where the control voltage drops below the minimum voltage of 21 V.

**Attention:**

**Attention:**  
Single faults (e.g. line faults at the emergency stop control device) are not detected with this external circuit configuration.

Suited up to SIL3. Performance Level e. Cat. 4

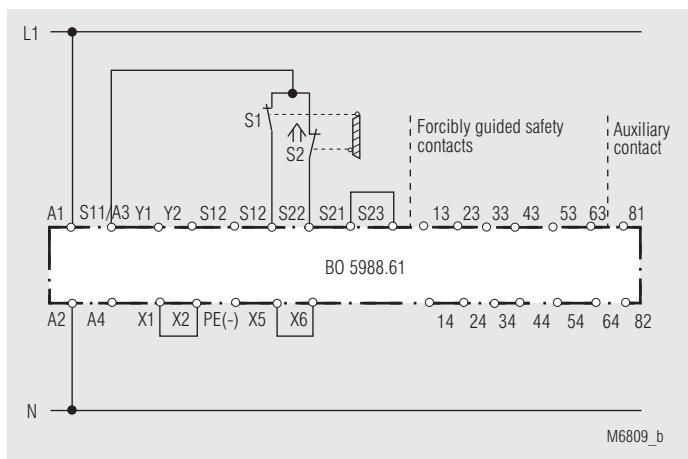

Two-channel emergency-stop circuit with cross fault detection.

Activation via On pushbutton. - - - Jumper X5 - X6:

A jumper must be fitted X5 - X6 for the automatic On function.

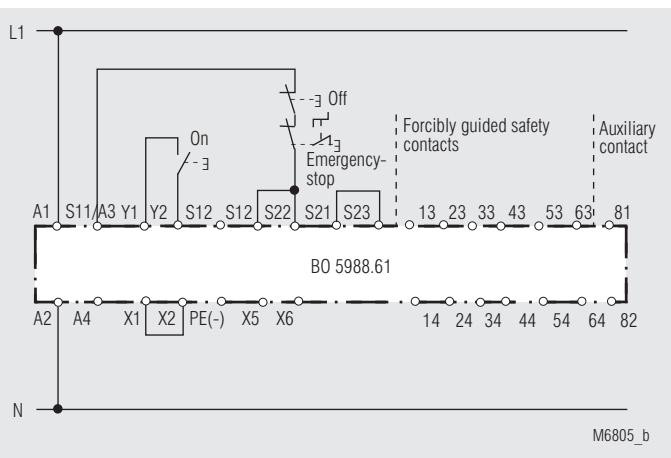

The On pushbutton is not required

Suited up to SIL3, Performance Level e, Cat. 4

Two-channel monitoring of a safety gate. S1 must not close before S2. Suited up to SIL3, Performance Level e, Cat. 4

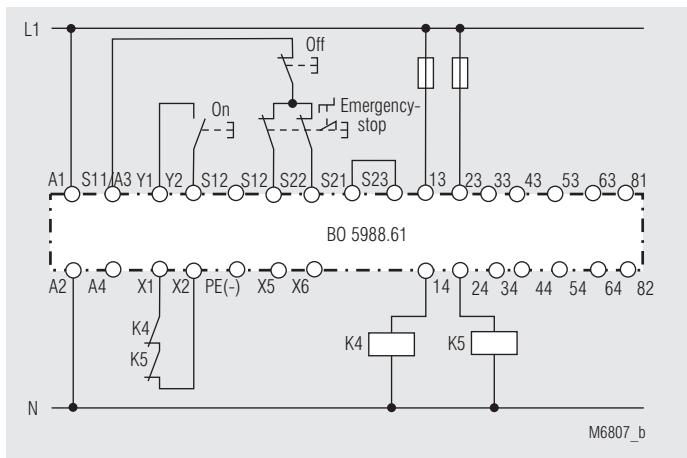

Scalped up to GTEC; Performance Level 6, Cat. 4

One-channel emergency stop circuit. This circuit does not have any redundancy in the emergency stop control device circuit.

Suited up to SIL2, Performance Level d, Cat. 3

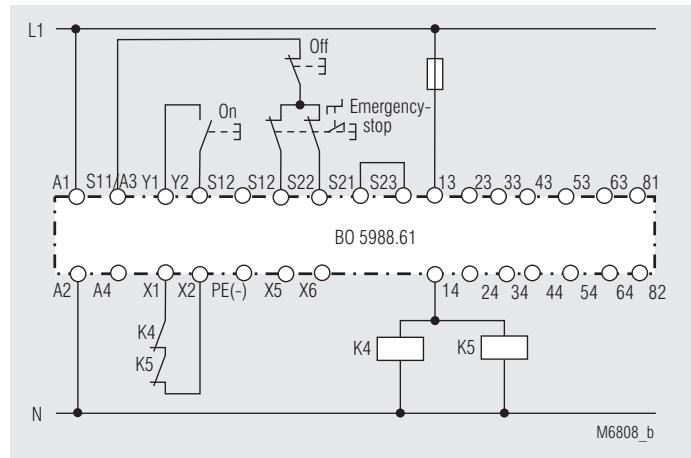

## Application Examples

Contact reinforcement by external contactors, two-channel

The output contacts can be reinforced by external contactors with forcibly guided contacts for switching currents > 8 A. Functioning of the external contactors is monitored by looping the NC contacts into the closing circuit (terminals X1 - X2).

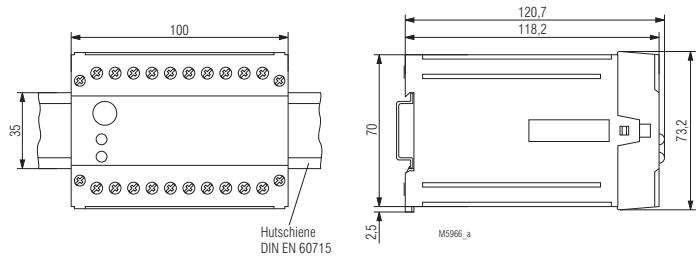

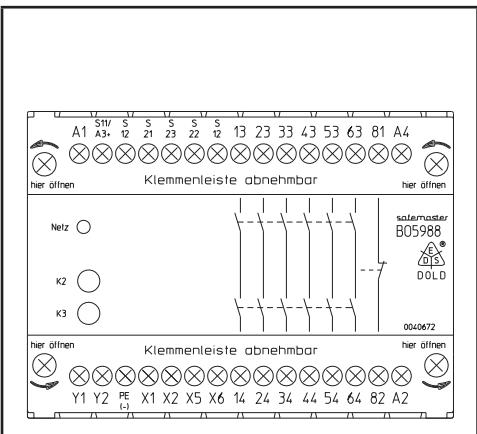

Suited up to SIL3, Performance Level e, Cat. 4

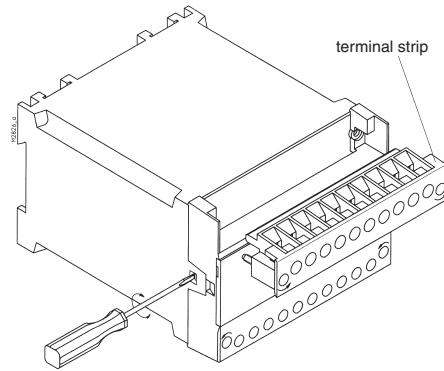

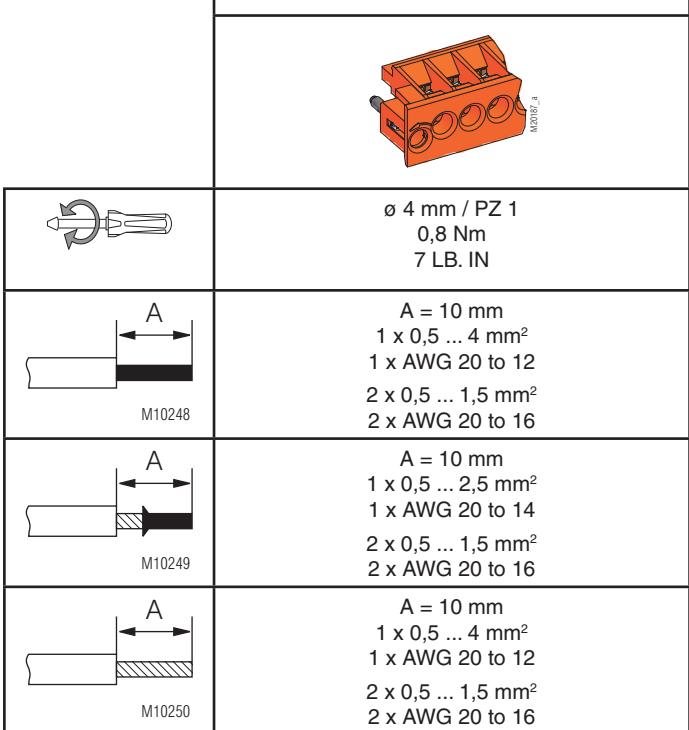

Contact reinforcement by external contactors with reduced safety level.  
Suited up to SIL3, Performance Level e, Cat. 4

**SAFEMASTER**  
Light Curtain Controller  
LG 5925/900

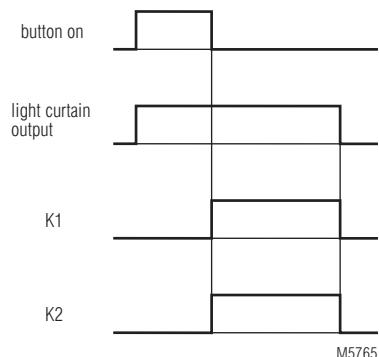

**DOLD** 

0255047

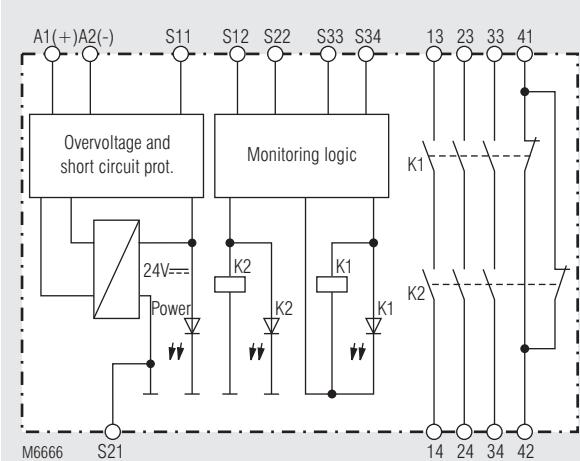

LG 5925/900

## Function Diagram

## Block Diagram

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508 and IEC/EN 61511
- According to EN 50156-2 for furnaces
- For light curtains with symmetric or asymmetric outputs adjustment with switch S1
- Output: max. 4 NO contacts, see contacts
- Single and 2-channel operation
- Line fault detection on On-button
- Manual restart or automatic restart, switch S2
- LED indicator for state of operation
- LED indicator for channel 1 and 2 and power
- Removable terminal strips
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled, or 2 x 2.5 mm<sup>2</sup> solid DIN 46 228-1/-2/-3/-4
- As option with pluggable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width 22.5 mm

## Approvals and Markings

## Applications

Protection of people and machines

- Light curtain controller for light curtains with selftesting (Type 4) according to IEC/EN 61 496-1
- Usage in furnace application in continuous operation acc. to EN 50156-1

## Indicators

- upper LED: on when supply connected  
lower LEDs: on when relay K1 and K2 energized

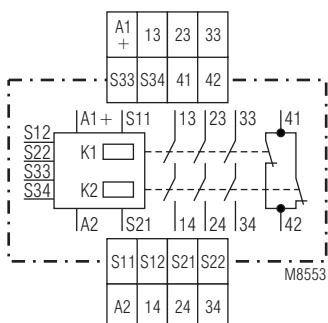

## Notes

Line fault detection on On-button:

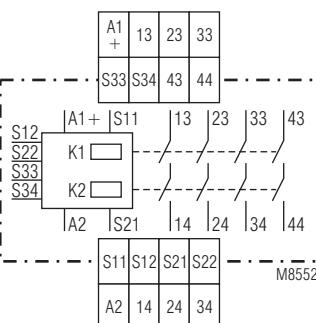

The line fault detection is only active when S12 and S22 are switched simultaneously. If The On-button is closed before S12, S22 is connected to voltage (also when line fault across On-Button), the output contacts will not close. A line fault across the On-button which occurred after activation of the relay, will be detected with the next activation and the output contacts will not close.

When using light curtains with asymmetric outputs (one output + switching, one output - switching) the MINUS switching output has to be connected to S22 and the Plus switching to S12.

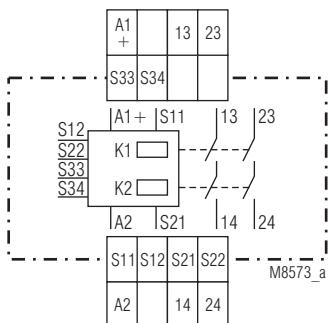

## Circuit Diagrams

A2	- / N
S12, S22, S33, S34	Inputs
S11, S21	Reference points to measure the control voltage
13, 14, 23, 24, 33, 34, 43, 44	Forcibly guided NO contacts for release circuit
41, 42	Forcibly guided indicator output

## Technical Data

### Input Circuit

Nominal Voltage $U_N$ :	DC 24 V
Voltage range:	0.9 ... 1.1 $U_N$
Nominal consumption:	DC approx. 1.7 W
Min. Off-time:	250 ms
Control voltage on S11 at $U_N$ :	DC 22.5 V
Control current typ. over S12, S22:	35 mA at $U_N$
Min. voltage on S12, S22 when relay activated:	DC 21
Short-circuit protection:	Internal PTC
Oversupply protection:	Internal VDR

### Output

Contacts	
LG 5925.02:	2 NO contacts
LG 5925.04:	4 NO contact
LG 5925.48:	3 NO, 1 NC contact

The NO contacts are safety contacts.

The NC contacts 41-42 can only be used for monitoring.

Operate delay typ. at $U_N$ :	
Manual start:	20 ms
Automatic start:	350 ms
Release delay typ. at $U_N$ :	
Disconnecting S12, S22:	15 ms
Contact type:	forcibly guided
Nominal output voltage:	AC 250 V
Thermal current $I_{th}$ :	DC: see limit curve for arc-free operation max. 8 A per contact see current limit curve

## Standard Type

LG 5925.48/900/61 DC 24 V

Article number:

0063278

- Output:

3 NO contacts, 1 NC contact

- Nominal voltage  $U_N$ :

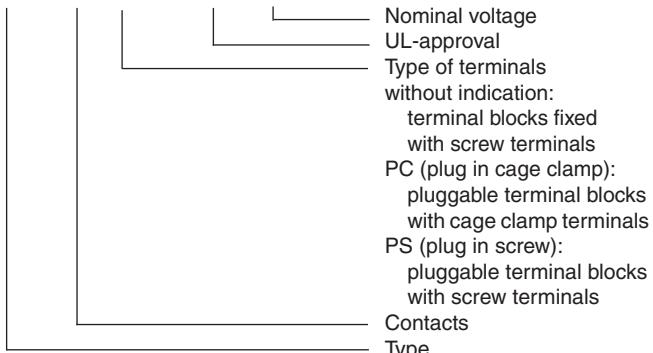

DC 24 V

- Width:

22.5 mm

## Ordering Example

LG 5925 .\_\_\_. /900 /61 DC 24 V

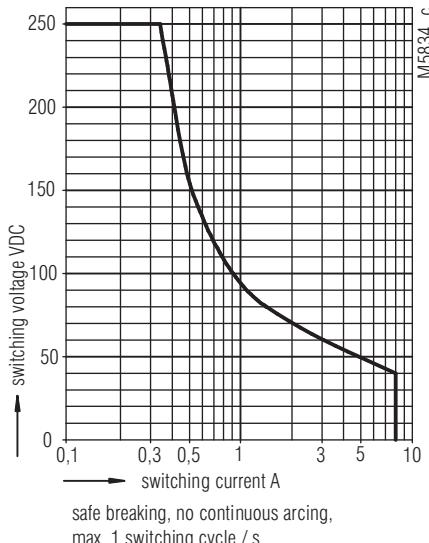

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	- Power supply not connected
LED "K1" lights up, but "K2" remains off	- Safety relay K1 is welded (replace device) - A 1-channel switch-off occurred on S12 (switch channel off on S22)
LED "K2" lights up, but "K1" remains off	- Safety relay K2 is welded (replace device) - A 1-channel switch-off occurred on S22 (switch channel off on S12)
Device cannot be activated	Manual start mode: - Line fault on start-button (disconnect power supply and remove fault) Automatic start mode: - S33-S34 not bridged - A safety relay is welded (replace device) - Incorrect setting of switch S1

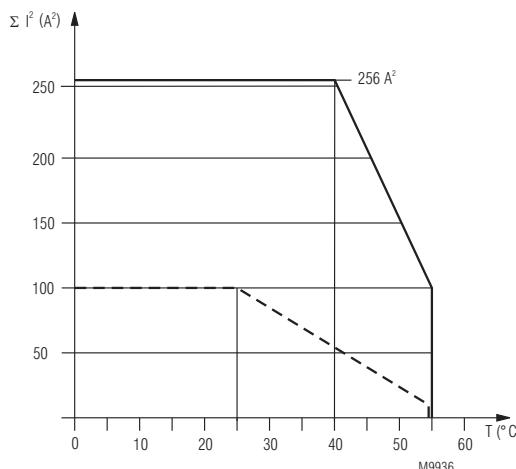

## Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristics

Arc limit curve under resistive load

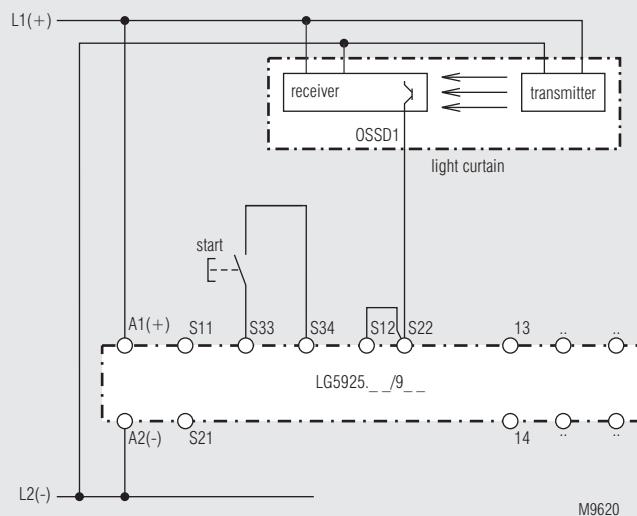

$$\Sigma I^2 = I_1^2 + I_2^2 + I_3^2 + I_4^2$$

$I_1, I_2, I_3, I_4$  - current in contactrows

Total current limit curve

## Application Examples

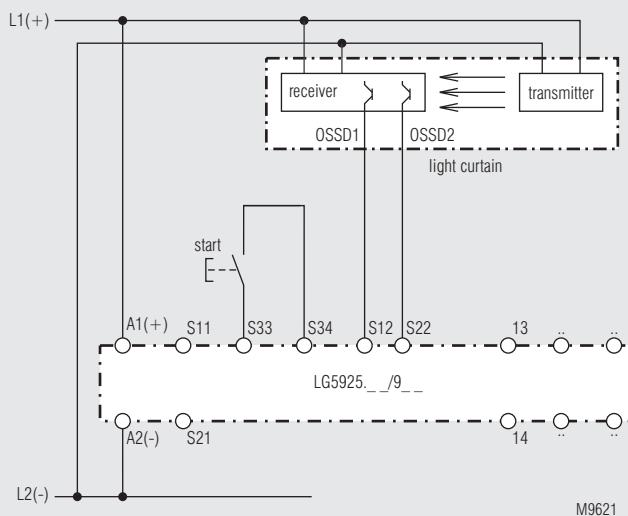

Single channel connection of light curtains with selftest according to EN 61 496-1.

**Note: Refer to "Unit programming"!**

Switches in pos.: S1 "symmetrical"

S2 "manual"

When autostart link S33 - S34, S2 set to "automatic". Suited up to SIL2, Performance Level d, Cat. 2

2channel connection of light curtains with selftest according to EN 61 496-1.

Cross fault detection in the light curtain.

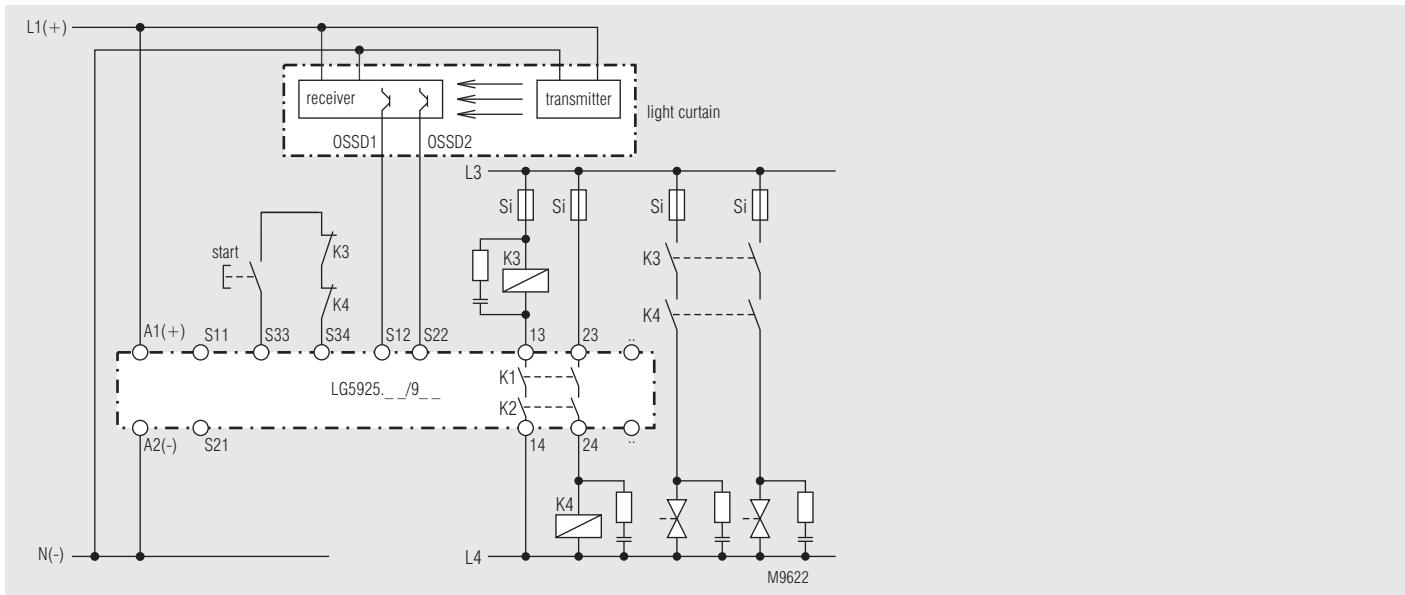

**Note: Refer to "Unit programming"!**

Switches in pos.:

S1: With symmetric outputs on light curtain switch S1 in position "symmetrical" with asymmetric outputs on light curtains switch S1 in position "asymmetric".

S2: "manual"

Suited up to SIL3, Performance Level e, Cat. 4

Contact reinforcement and contact extension by external contactors

**Note: Refer to "Unit programming"!**

Switches in pos.:

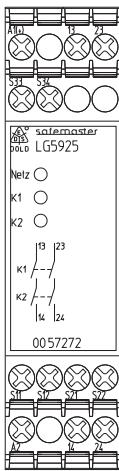

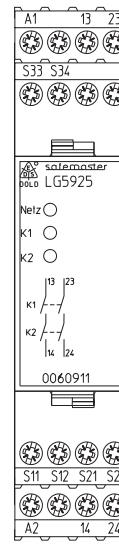

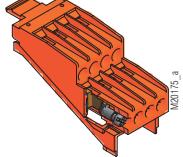

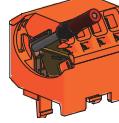

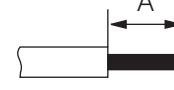

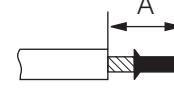

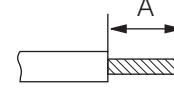

Switches in pos.:

S1: With symmetric outputs on light curtain switch S1 in position "symmetrical" with asymmetric outputs on light curtains switch S1 in position "asymmetric".

**SAFEMASTER**  
Light Curtain Controller  
BG 5925. \_\_/900

**DOLD** 

0233217

## Function Diagram

## • According to

- Performance Level (PL) e and category 4 to EN ISO 13849-1
- SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
- Safety Integrity Level (SIL) 3 to IEC/EN 61508
- Output: max. 3 NO contacts, see contacts
- Single and 2-channel operation
- Line fault detection on On-button
- Manual restart or automatic restart, switch S2
- For light curtains with symmetric or asymmetric outputs, selection via S1
- Option: fast auto start
- LED indicator for channel 1 and 2 an power
- Removable terminal strips
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled (isolated), DIN 46 228-1/-2/-3/-4 or 2 x 2.5 mm<sup>2</sup> stranded ferruled DIN 46 228-1/-2/-3
- Width 22.5 mm

## Approvals and Markings

## Applications

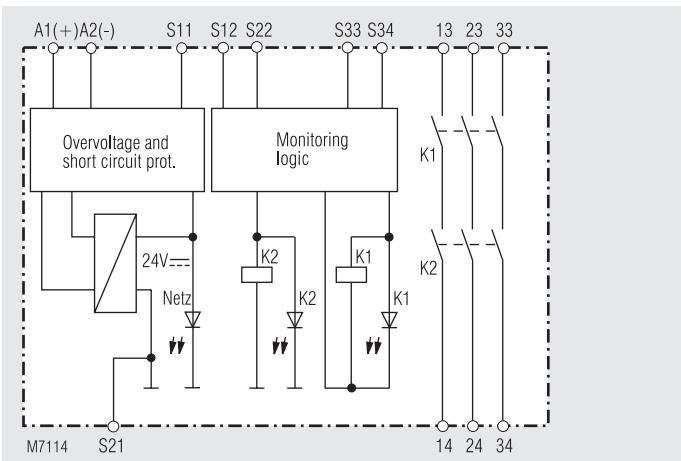

Protection of people and machines

- switch gear (FSD) for light bars with selftest (type 4) according to IEC/EN 61 496-1

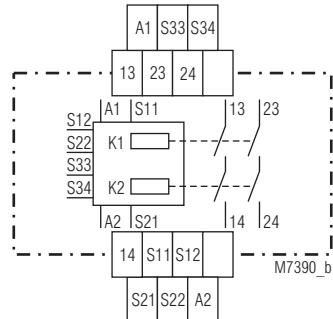

## Indicators

- upper LED: on when supply connected  
lower LEDs: on when relay K1 and K2 energized

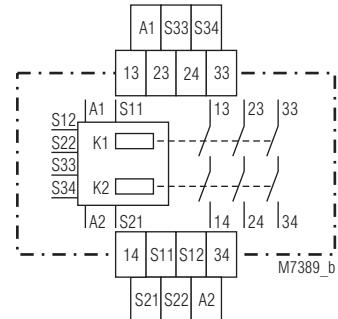

## Block Diagram

S11, S21, S33	Outputs
13, 14, 23, 24, 33, 34	Forcibly guided NO contacts for release circuit
21, 22, 31, 32	Forcibly guided indicator output

M10794

**symmetric:**  
Light bars with symmetric outputs

**asymmetric:**  
Light bars with asymmetric outputs

Drawing shows setting at the state of delivery

## Notes

### Line fault detection on On-button:

The line fault detection is only active when S12 and S22 are switched simultaneously. If the On-button is closed before S12, S22 is connected to voltage (also when line fault across On-Button), the output contacts will not close.

A line fault across the On-button which occurred after activation of the relay, will be detected with the next activation and the output contacts will not close. If a line fault occurs after the voltage has been connected to S12, S22, the unit will be activated because this line fault is similar to the normal On-function.

When using light curtains with asymmetric outputs (one output + switching, one output - switching) the MINUS switching output has to be connected to S22 and the Plus switching to S12.

The gold plated contacts of the BG 5925 mean that this module is also suitable for switching small loads of 1 mVA - 7 VA, 1 mW - 7 W in the range 0.1 - 60 V, 1 - 300 mA. The contacts also permit the maximum switching current. However since the gold plating will be burnt off at this current level, the device is no longer suitable for switching small loads after this.

## Technical Data

### Input circuit

Nominal Voltage $U_N$ :	DC 24 V
Voltage range	DC
at 10% residual ripple:	0.9 ... 1.1 $U_N$
Nominal consumption:	approx. 2.5 W
Min. Off-time:	250 ms
Control voltage on S11:	DC 23 V at $U_N$
Control current over S12, S22:	approx. 55 mA at $U_N$
Min. voltage between terminals S12, S22 and S21:	DC 21 V when relay activated and $U_N$ on A1 - A2
Short-circuit protection:	Internal PTC
Oversupply protection:	Internal VDR

### Output

Contacts	
BG 5925.02:	2 NO contacts
BG 5925.03:	3 NO contact
BG 5925.16:	1 NO, 1 NC contact
BG 5925.22:	2 NO, 1 NC contact

The NO contacts are safety contacts.

**The NC contacts 21-22 or 31-32 can only be used for monitoring.**

### Operate delay typ. at $U_N$ :

Manual start:	40 ms
Automatic start:	250 ms
BG 5925_/_901:	100 ms

### Release delay typ. at $U_N$ :

Disconnecting S12, S22:	15 ms
In the case that S22 is not disconnected because of fault:	≤ 200 ms
Contact type:	forcibly guided

## Technical Data

### Nominal output voltage:

AC 250 V

DC: see limit curve for arc-free operation

5A 24Vdc Resistive or G.P.

Ambient temperature 55°C: Pilot duty B300  
4A 250Vac Resistive  
4A 24Vdc Resistive or G.P.

**Wire connection:** 60°C / 75°C copper conductors only  
AWG 20 - 12 Sol Torque 0.8 Nm  
AWG 20 - 14 Str Torque 0.8 Nm

Technical data that is not stated in the UL-Data, can be found in the technical data section.

## Standard Type

BG 5925.02/900/61 DC 24 V

Article number: 0050918

- Output: 2 NO contacts
- Nominal voltage  $U_N$ : DC 24 V
- Width: 22.5 mm

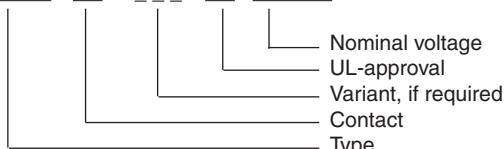

## Variant

BG 5925.02/901/61: unit with fast autostart, switch 2 on "Autostart".

Without line fault detection on ON-button when S2 on "Handstart"

## Ordering example for variant

BG 5925 .02 /\_/\_/\_ /61 DC 24 V

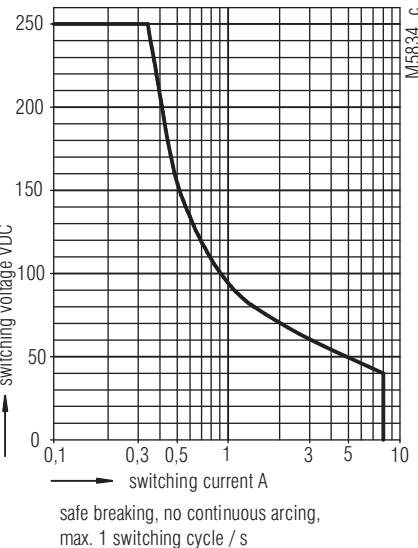

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	- Power supply not connected
LED "K1" lights up, but "K2" remains off	- Safety relay K1 is welded (replace device) - A 1-channel switch-off occurred on S12 (switch channel off on S22)
LED "K2" lights up, but "K1" remains off	- Safety relay K2 is welded (replace device) - A 1-channel switch-off occurred on S22 (switch channel off on S12)
Device cannot be activated	Manual start mode: - Line fault on start-button (disconnect power supply and remove fault) Automatic start mode: - S33-S34 not bridged - A safety relay is welded (replace device) - Incorrect setting of switch S1

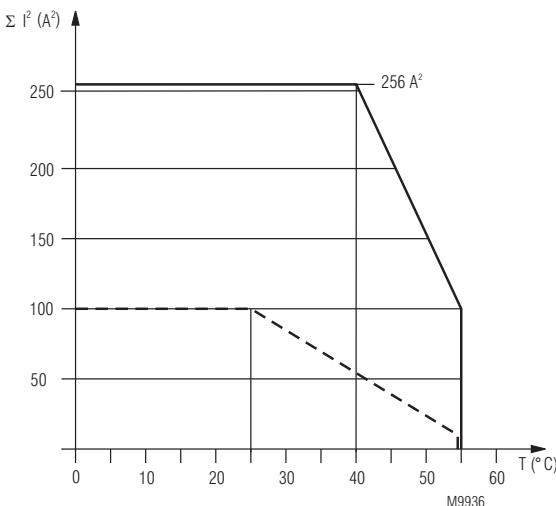

## Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristic

Arc limit curve under resistive load

device mounted on distance with air circulation.  
max. current at 55°C over  
4 contactrows = 5A  $\sqrt{4 \times 5^2 A^2} = 100 A^2$

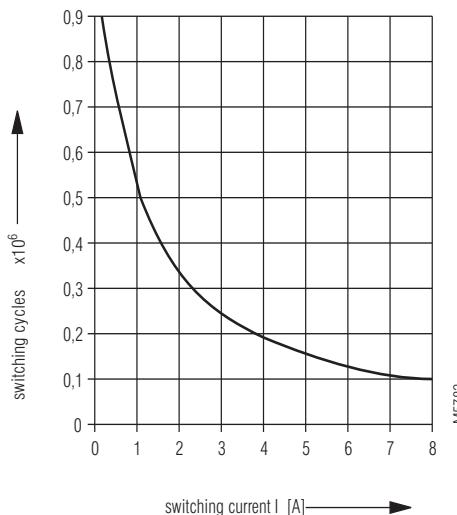

device mounted without distance heated by  
devices with same load.  
max current at 55°C over  
4 contactrows = 1A  $\sqrt{4 \times 1^2 A^2} = 4 A^2$

$$\Sigma I^2 = I_1^2 + I_2^2 + I_3^2 + I_4^2$$

$I_1, I_2, I_3, I_4$  - current in contactrows

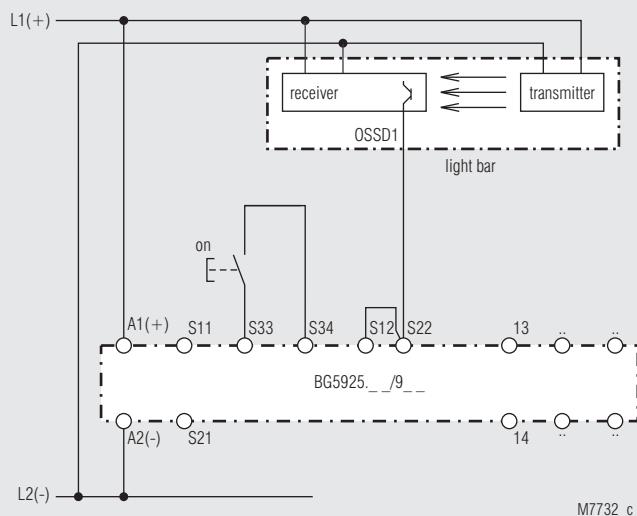

Quadratic total current limit curve  
electric life DC13 24V DC /  $t_{on}$  0.4s;  $t_{off}$  9.6s

2 contacts in series

Contact service life

## Application Examples

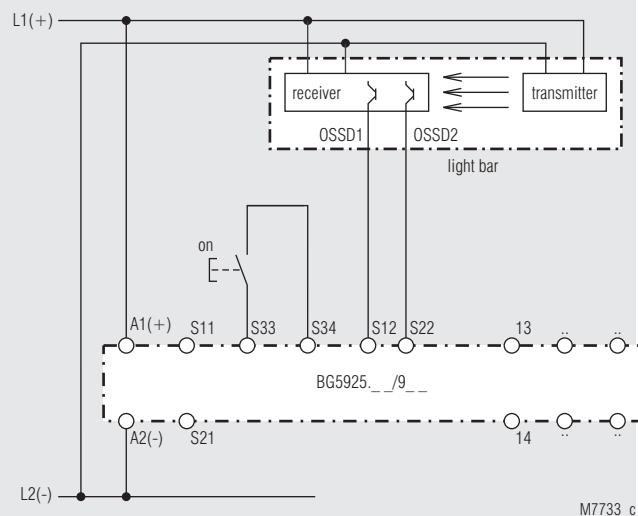

1-channel control by light bar with selftest according to EN 61 496-1

**Note: Refer to "Unit programming"!**

Switches in pos.: S1: "symmetric"

S2: manual start

Suited up to SIL2, Performance Level d, Cat. 2

2-channel control by light bar with selftest according to EN 61 496-1.

Crossfault monitoring by light bar.

**Note: Refer to "Unit programming"!**

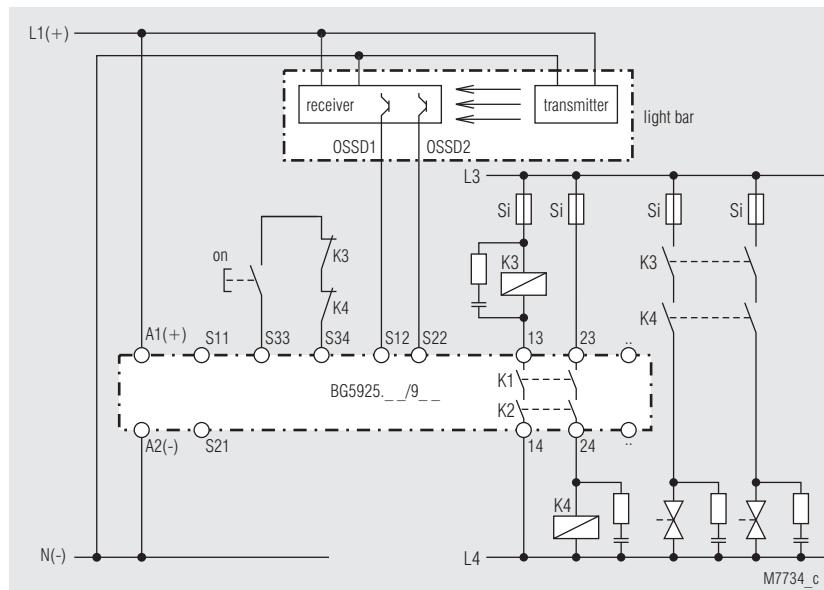

Switches in pos.:

S1: On light curtains with symmetric outputs S1 in upper position "symmetric".

On light curtains with asymmetric outputs S1 in lower position "asymmetric".

S2: manual start

Suited up to SIL3, Performance Level e, Cat. 4

Reinforcement and multiplication of contacts by external contactors

**Note: Refer to "Unit programming"!**

Switches in pos.:

S1: On line curtains with symmetric outputs S1 in upper position "symmetric".

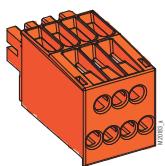

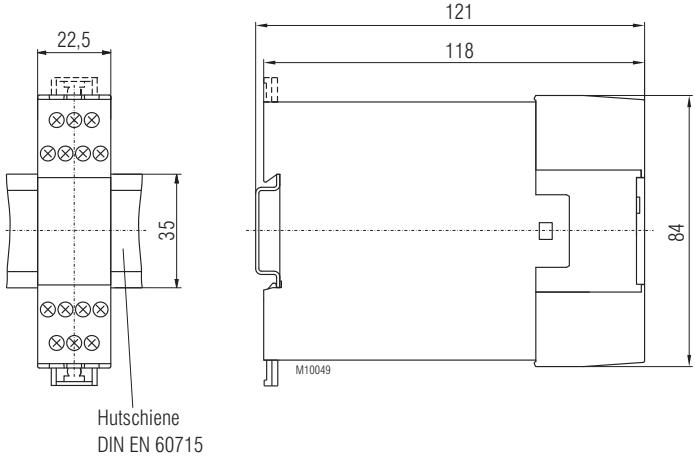

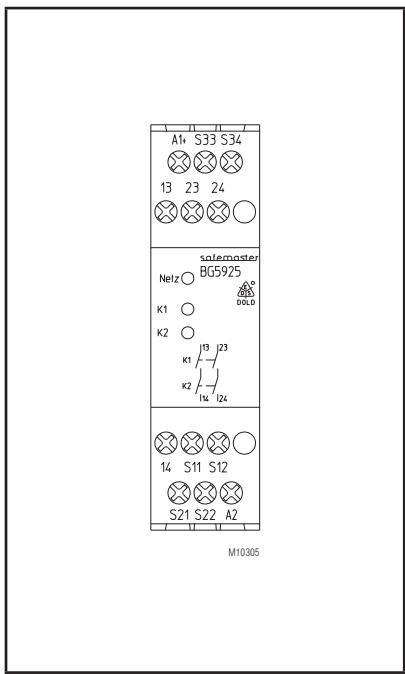

On line curtains with asymmetric outputs S1 in lower position "asymmetric".

S2: manual start

Suited up to SIL3, Performance Level e, Cat. 4

# Safety Technique

## SAFEMASTER

Light Curtain Controller With Selectable Operating Modes

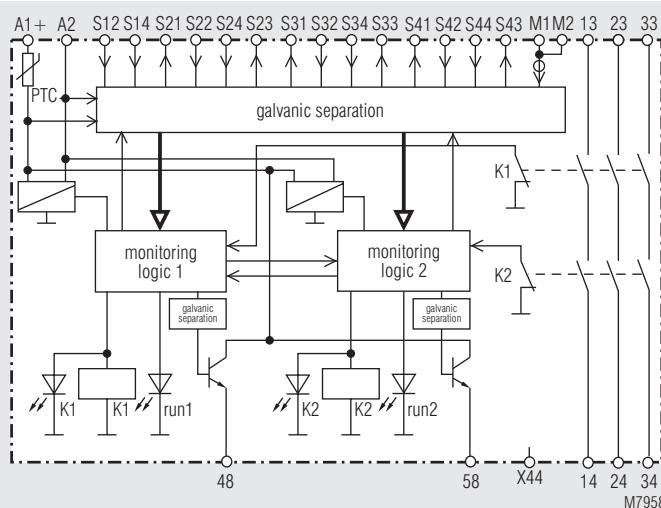

BH 5902/01MF2

**DOLD** 

0237093

### Block Diagram

### • According to

- Performance Level (PL) e and category 4 to EN ISO 13849-1: 2008
- SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
- Safety Integrity Level (SIL 3) to IEC/EN 61508
- Category 4 to EN 954-1

### • To connect max.:

- 3 light curtains 2-channel or
- 2 light curtains 2-channel and 2 muting sensors 1-channel or
- 1 light curtain 2-channel and 4 muting sensors 1-channel or
- 2 light curtains 2-channel and key switch for stepping operation
- additionally: Start button and machine contact with line fault detection

### • Broken wire detection on light curtain input

### • Outputs:

- 3 NO or 2 NO and 1 NC
- 2 Semiconductor outputs, protected against short circuit and overload
- Multifunction device, different functions selectable by rotational switches:
  - protective operation e.g. light curtains
  - protective operation with muting, e.g. conveyors
    - \* signal sequence of muting sensors can be selected
    - \* override function via start button
  - Stepping operation e.g. on presses
    - \* optionally with key switch
    - \* 1, 2 or 3 steps possible
    - \* setting of number of step possible via selector switch

### • Suitable to connect light curtains of type 4 or selftesting light curtains type 2 according to IEC/EN 61 496-1, crossfault monitoring in the light curtain

### • With under- and overvoltage detection and indication

### • Reaction time: max. 30 ms

### • LED indication for RUN and Channel 1,2

### • Width 45 mm

### Approvals and Markings

### Applications

- Protection of men and machines e.g. presses and conveyors

### Indicators

lower green LEDs

K1, K2:

upper yellow LED

run 1:

- on, when K1 and K2 are energized

- permanent on, when relay K1 and K2 are energized
- flashes with 1 Hz when the unit waits for the start signal after fault free operation (power up of the unit)
- flashes fast with approx. 3 Hz when the start button is pressed and all conditions for an override are fulfilled during muting
- flashes fast with approx. 3 Hz when at stepping operation the unit waits for interruption of the light curtain
- flashes with failure code to indicate normal indication states that disable the energisation of the output relays (e.g. after not allowed interruption of the light curtain) until the start button is pressed
- flashes with failure code to indicate special failures (e.g. undervoltage)

semiconductor output 48: - off, when unit is in special failure mode

- normally off when relays K1 and K2 are energized
- continuously on, when unit in muting mode
- shows the same failure codes as LED run 1 (except on special failures)

## Indicators

- upper yellow LED run 2:
- permanent on, when unit operates correctly
  - flashes with failure code to indicate special operation failures (e.g. undervoltage)
- semiconductor output 58:
- off, when unit is on special failure mode
  - off, when relays K1 and K2 are energized
  - symmetric flashing, when a normal functional state is active that disables the energisation of the output relays (e.g. no allowed interruption of a light curtain)
  - permanent on, when waiting for start

## Notes

- On BH 5902.22 the NC contact 31-32 must only be used as monitoring contact
- Not suitable for machines where the area behind the light curtain is accessible
- Settings have to be carried out by educated personnel with disconnected power supply

## Operation Modes

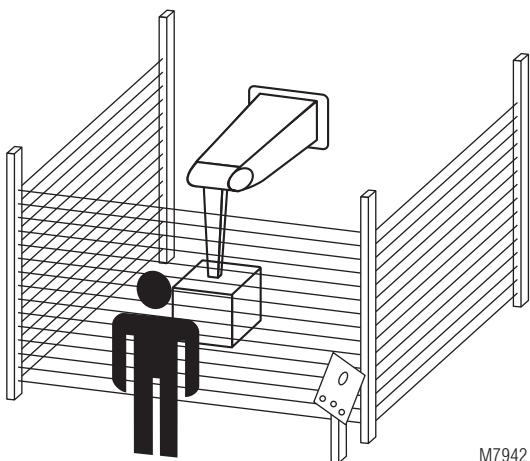

### Protective operation (see Picture 1)

e.g. light curtains to secure dangerous areas

- Connection up to 3 light curtains
- Manual or automatic start possible for each light curtain
- With or without feedback input for external contactors

Possible settings:

Switch 10: Start mode and feedback input										
	0	1	2	3	4	5	6	7	8	9
	without feedback input			with feedback input						
Switch 1	0	LC 1 LC 2 LC 3	Auto Manu Manu	Auto Auto Manu	Auto Auto Auto	not allowed (fault 5)	Auto Manu Manu	Auto Auto Manu	Auto Auto Auto	not allowed (fault 5)
1	LC 1 LC 2 LC 3	Manu Manu Manu	Manu Auto Manu	Manu Auto Auto	Manu Manu Manu		Manu Manu Manu	Manu Auto Manu	Manu Auto Auto	

M7942

## Operation Modes

### Automatic start

On automatic start the contacts K1 and K2 are energized when the light curtain that is set for auto start is free after interruption. It is necessary that the other light curtains with manual start are not interrupted.

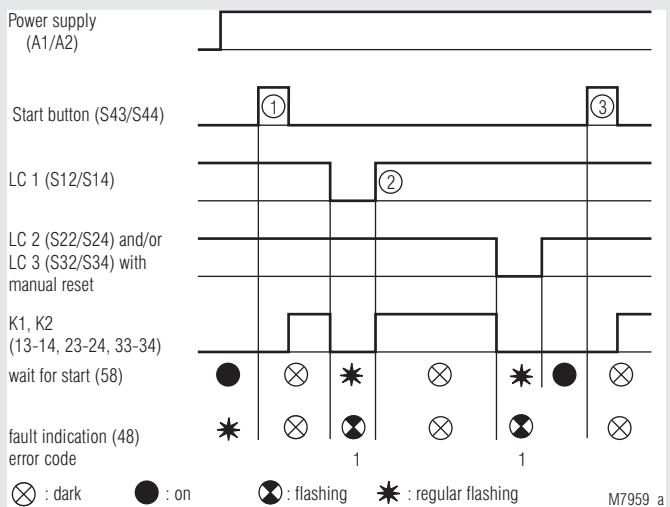

### Manual start

On manual start the contacts K1 and K2 are energized when the light barrier that is set for manual start is free after interruption and the start button is pressed ③

The start button must be activated in 2 conditions:

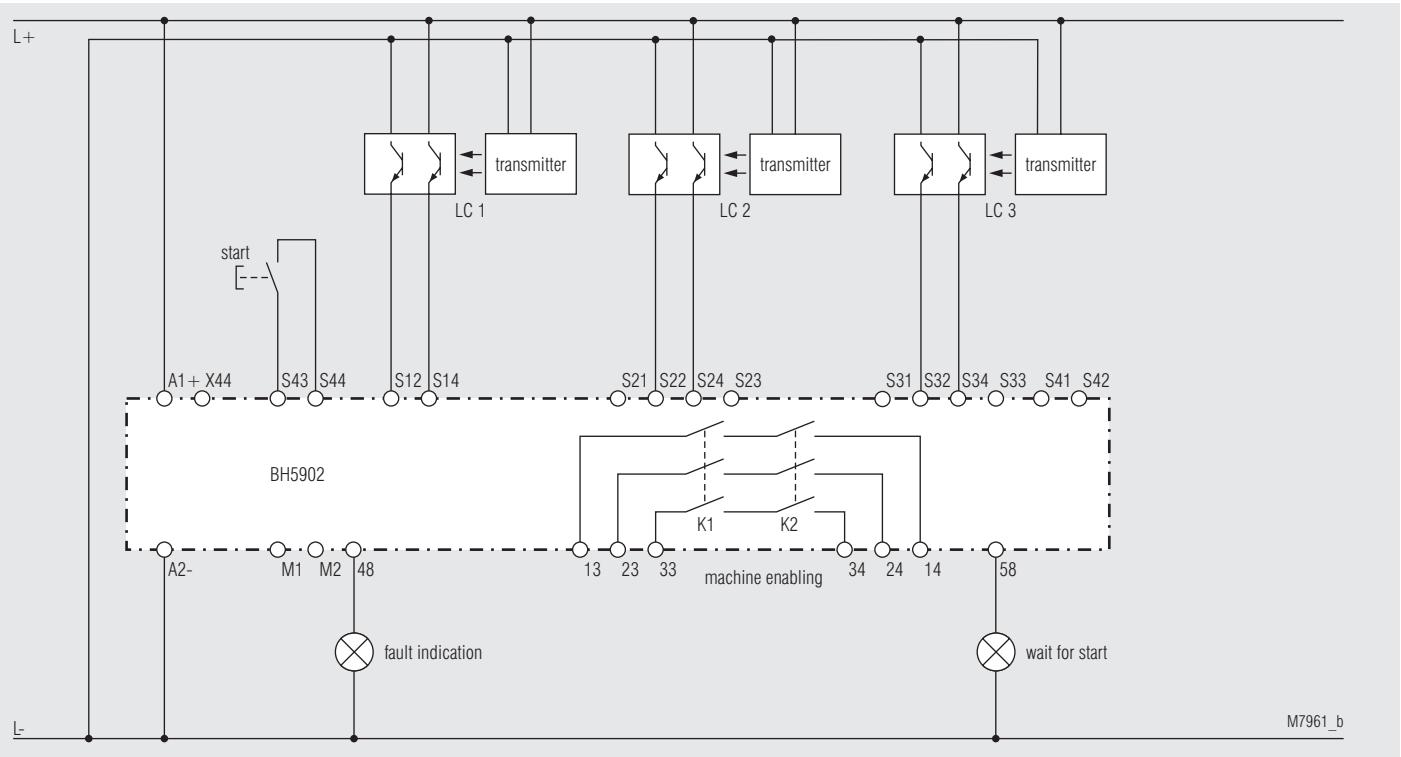

- after return of the supply voltage ①  
(when minimum 1 light curtain is programmed for manual start)
- when 1 light curtain with manual start was interrupted ③

## Function Diagram

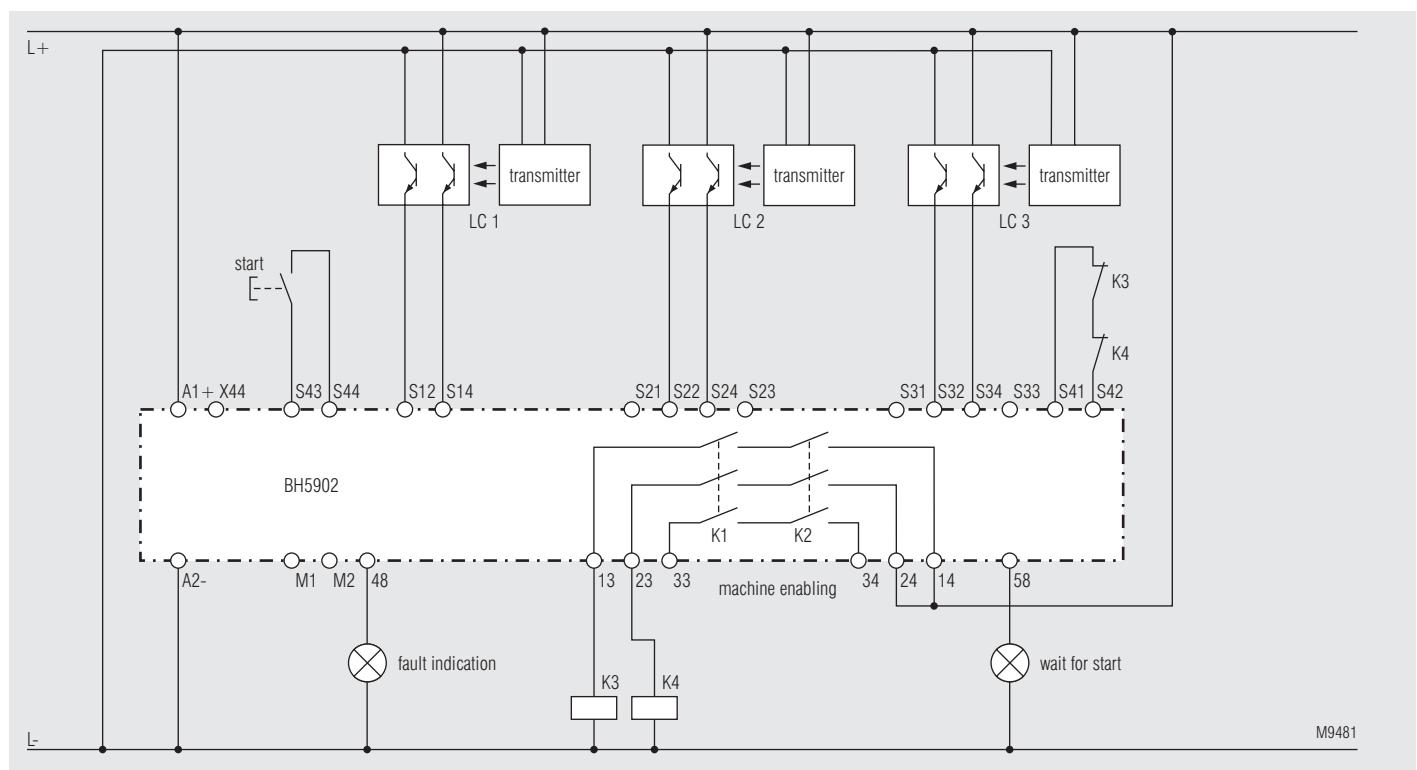

M7959\_a

## Application Examples

Picture 1: Protective operation with 3 LCs, manual or auto start, setting without feedback input

Picture 2: Protective operation with 3 LCs, manual or autostart, setting with feedback input

## Operation Modes

### Protective operation with muting

- e.g. conveyors
- 1 or 2 light curtains
- Muting of light curtain 1
- 2 or 4 muting sensors with different input sequences
- LC1 with auto or manual start
- LC2 always with manual start
- Override via start button
- Manual start is always necessary after supply voltage is connected

### Muting

Muting means to disable temporarily the protective function of a light curtain. This function is used to transport material through a light curtain without stopping the machine. The differentiation between material and persons is done by additional muting sensors which have to create a certain switching sequence together with the light curtain when material passes the light curtain. The muting control starts then the muting cycle for the time the material is passing the light curtain. It must not be possible that a person activates the muting sensors in the same switching sequence as the material. To realise this function 2 different switching sequences can be chosen on BH 5902 either with 2 or 4 muting sensors. This makes sure that if a person passes the light curtain the dangerous movement of the machine is stopped immediately. The muting cycle is indicated by a muting lamp that is controlled and monitored by the BH 5902. The maximum muting time can be set in 10 steps between 10 s and infinite.

If the light curtain is still interrupted after the max. permitted muting time e.g. by blocked material the contacts K1, K2 open and the muting lamp as well as the LED run 1 show failure code 4.

Starting by pressing the start button is only possible if the muting lamp is working and the light curtain to be muted is free of interruption. During the muting cycle a wrong switching sequence or exceeding the maximum muting time leads to failure code 4. This failure can only be reset by pressing the start button. The muting sensors have to be installed in a way, that the correct sequence cannot be achieved manually or by passing the light curtain (see IEC/EN 61 491-1)

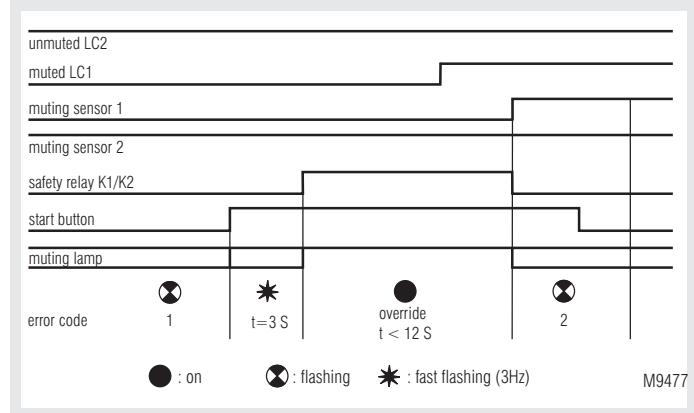

Possible settings:

Switch 1	Switch 10: a = maximum muting time b = maximum synchronising time									
	0	1	2	3	4	5	6	7	8	9
2	LC S1 Auto, muting 2 sensors	a: 10 s / b: 3 s								no muting time monitoring
3	LC S1 Manu, muting 2 sensors	a: 20 s / b: 3 s	a: 30 s / b: 3 s	a: 1 min / b: 6 s	a: 5 min / b: 30 s	a: 15 min / b: 90 s	a: 30 min / b: 3 min	a: 1 h / b: 3 min	a: 8 h / b: 3 min	
4	LC S1 Auto, muting 4 sensors									
5	LC S1 Manu, Muting 4 sensors									

### Override

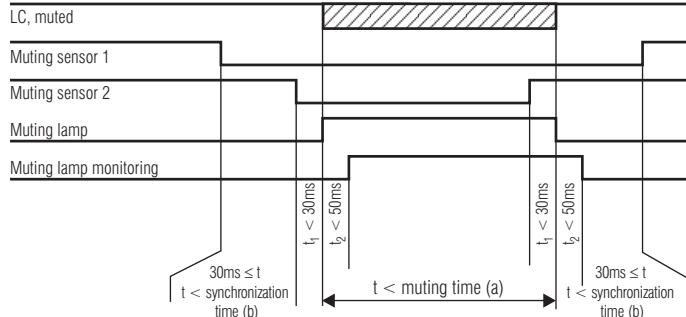

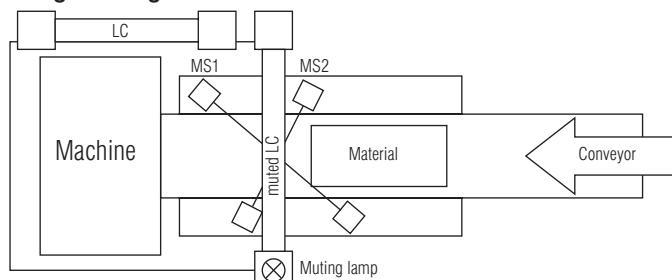

If the monitored area is blocked by transported material and the outputs K1, K2 are switched off, this is indicated by fast flashing (approx. 3 Hz) of the muting lamp. The operator can activate the outputs K1, K2 by pressing the start button for more than 3 s for a maximum time of 12 s until the muting sensor are again inactive or the start button is released again.

Example for an override cycle when muting with 2 sensors

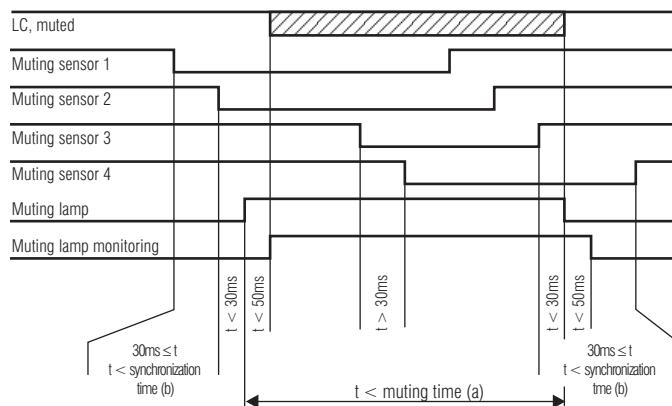

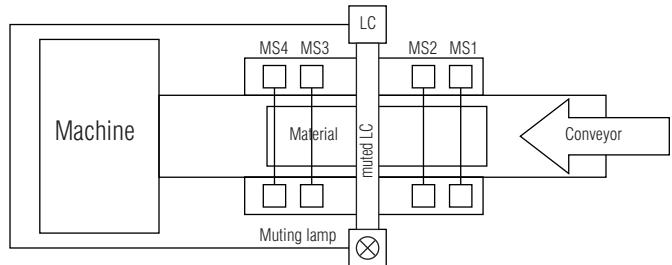

In all function diagrams the part "monitored operation" is the phase where the unit differentiates between men and material.

### Using 2 muting sensors

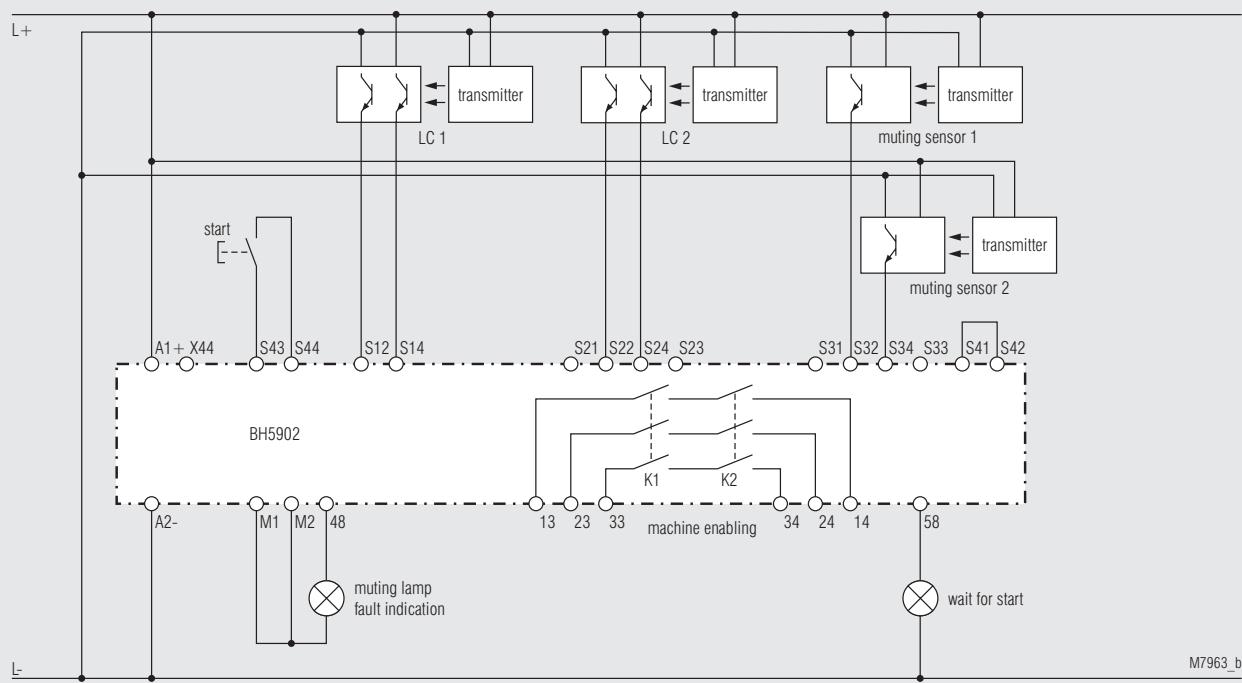

M7962\_a

### Using 4 muting sensors

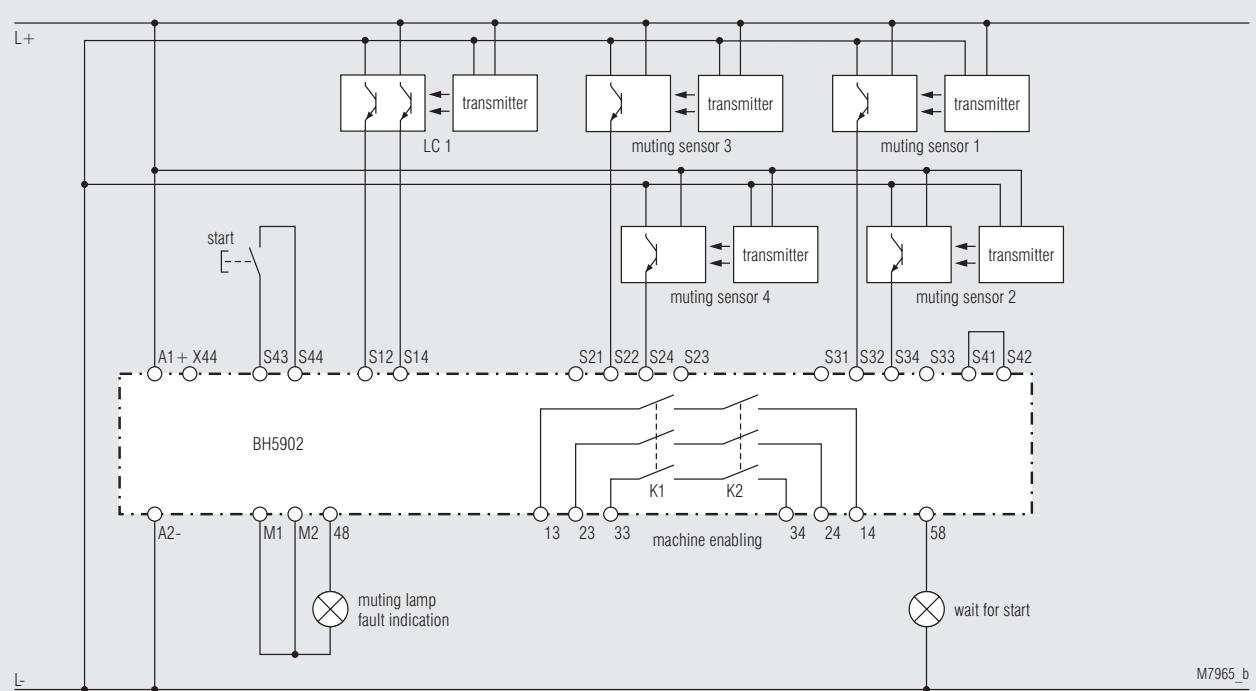

M7964\_a

## Application Examples

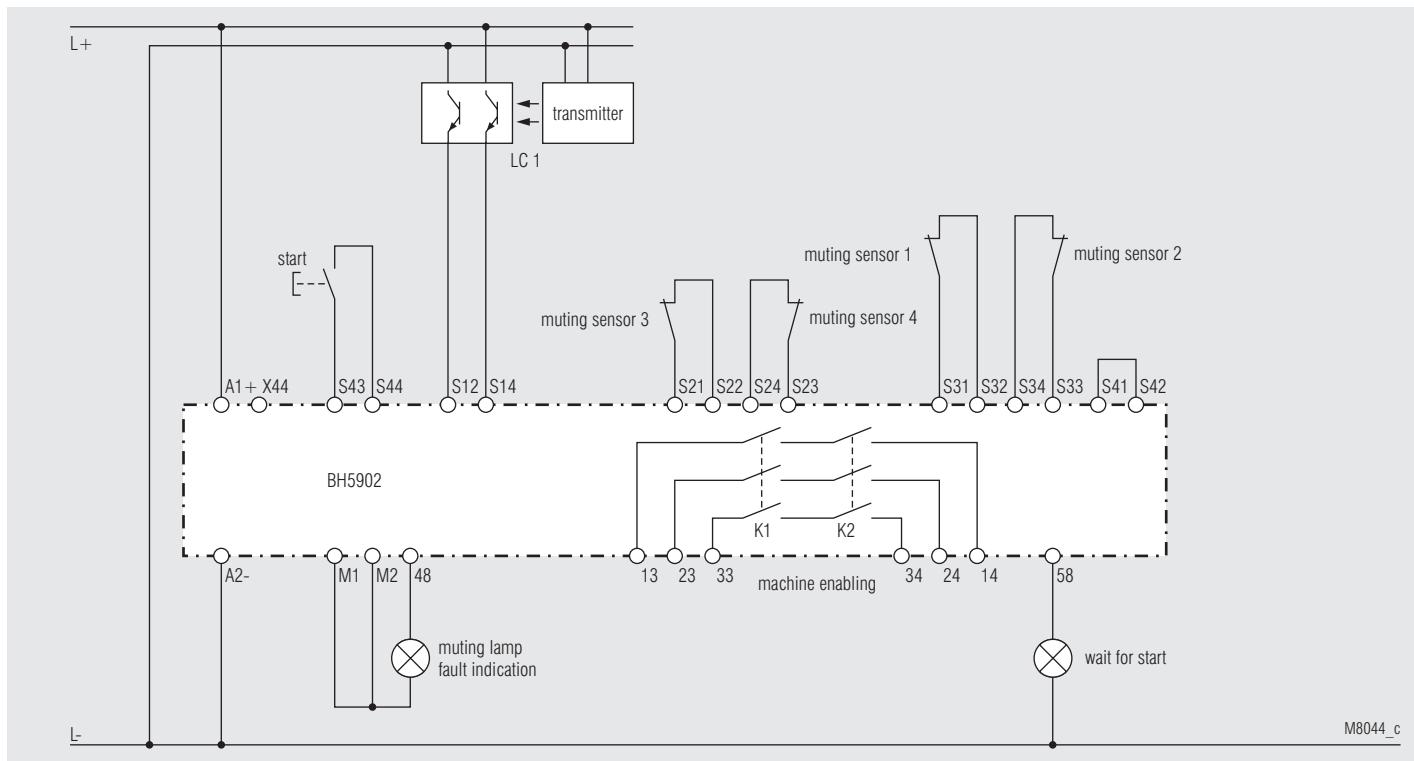

Picture 3: Protective operation with muting a light curtain via 2 muting sensors, 2 light curtains

Picture 4: Protective operation with muting, 1 light curtain, 4 muting sensors

## Application Example

Picture 5: Protective operation with muting via 4 muting sensor contacts

### Contact reinforcement

If external relays or contactors are used to reinforce or multiply the contacts of the safety relays these must be monitored by feeding back one NC contact of each relay/contactor into the start circuit (see application example picture 8).

## Operation Modes

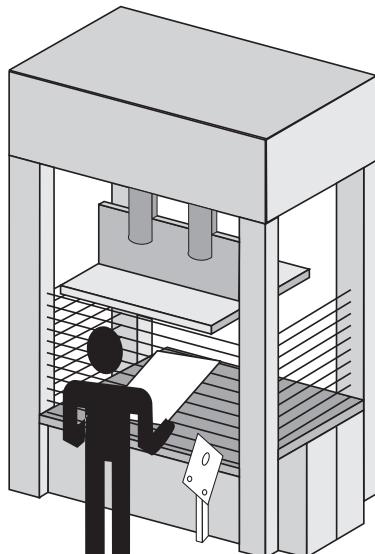

### Stepping operation

e.g. Presses with manual operation and automatic start

- Max. 3 light curtains
- LC2 and LC3 always with manual start

Setting functions:

- 1, 2 or 3 steps
- 2 different start sequences
- 2 ways of monitoring the machine contact
- Number of steps fixed or settable with key switch

M7955

Stepping operation enables automatic restart of a machine (Press) after a certain number of accesses into the protected area of the first LC. This Operation consists of start sequence and normal sequence.

Possible settings

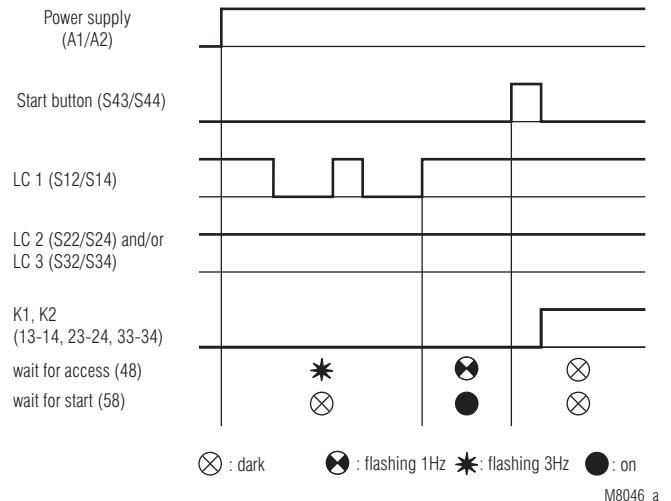

Stepping operation		Switch 10: Number of steps				
		0	1	2	3	4 - 9
Switch 1	6	selectable by key switch	1 step	2 step	3 step	not allowed (fault 5)
	7					
	8					
	9					

### Start sequence

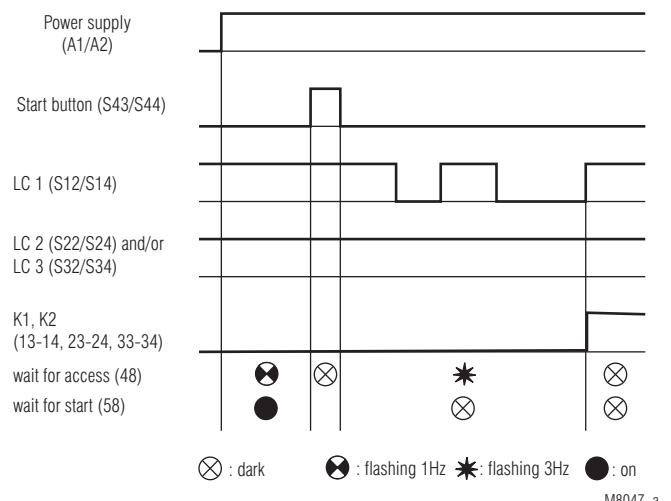

To enable the machine at start-up on stepping operation 2 different start sequences can be chosen:

- 1.) The required number of interruptions of the LC must be completed and then the start button must be pressed.
- 2.) The start button is pressed first, and after that the required number of interruptions must be completed.

The request to start the operation (e.g. 2 steps according to the diagrams below) is signalled by a flashing lamp (terminal 48). The request to press the start button is signalled by continuous light on a lamp (terminal 58). After finishing the starting sequence correctly the lamps go off and the contact K1 and K2 close.

Start sequence: 2 steps and start button

Start sequence: start button and 2 steps

## Operation Modes

### Normal sequence

A correct starting sequence is necessary to run the normal operating sequence. In the normal operating sequence the machine movement is signalled to the light curtain by opening and closing of the machine contact. The output contacts of the BH 5902 are opened when the machine contact opens. After that the operator must interrupt the LC for the required number of times to start again the machine operation. All necessary steps must be completed within 30 s. The demand to access is indicated on fast flashing (3 Hz) output 48. When the required number of interruptions on the LC is completed the lamp goes off and the contacts K1 and K2 close.

### Machine contact

To the terminals S41 and S42 of the BH 5902 a machine contact must be connected. It opens and closes depending on the machine movement.

### Monitoring of the machine contact

2 ways of monitoring are selectable:

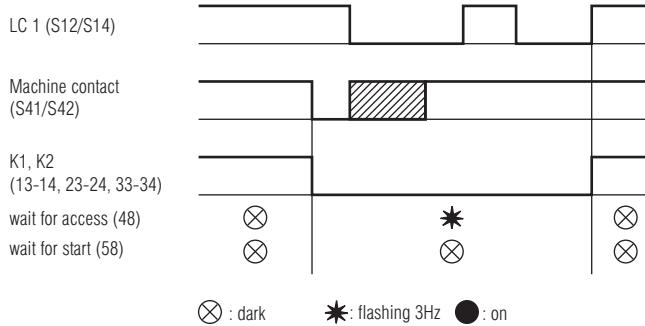

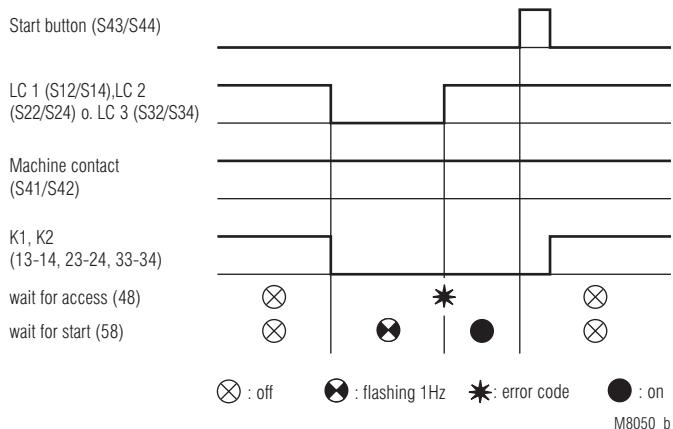

#### Mode 1

In this mode the access to the LC must only be done when the machine contact has been openend and closed again. An exception is when the access is done while the contact is open and still is going on while the contact closes.

#### Mode 2

In this mode the accesses are accepted already when the machine con-

The lamp on terminal 48 flashes with code 1. After finishing the access the lamp on terminal 58 returns to permanent light and signalises, that the machine can be started with the start button.

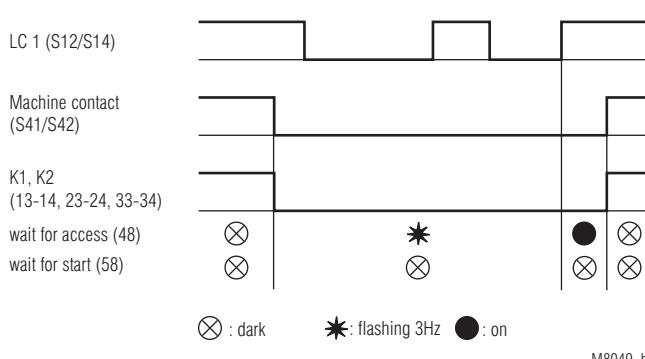

Application: Presses with normal to fast movement

tact is open. The machine is only enabled when all the accesses are completed and the machine contact is closed again.

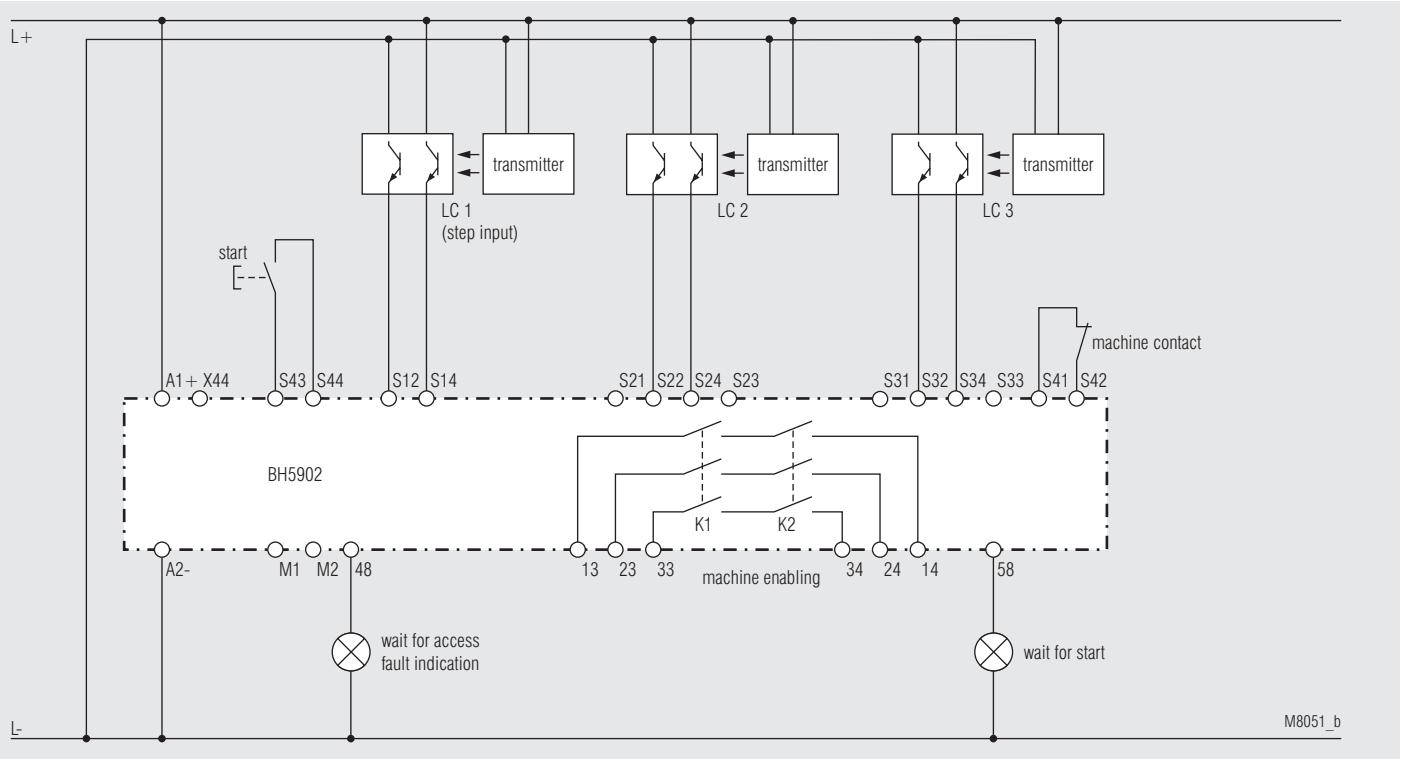

### Forbidden access into the light curtain

On forbidden access the lamp (on terminal 58) shows symmetric flashing.

Application: Presses with slow movement

## Application Examples

Picture 6: Stepping operation with 3 light curtains

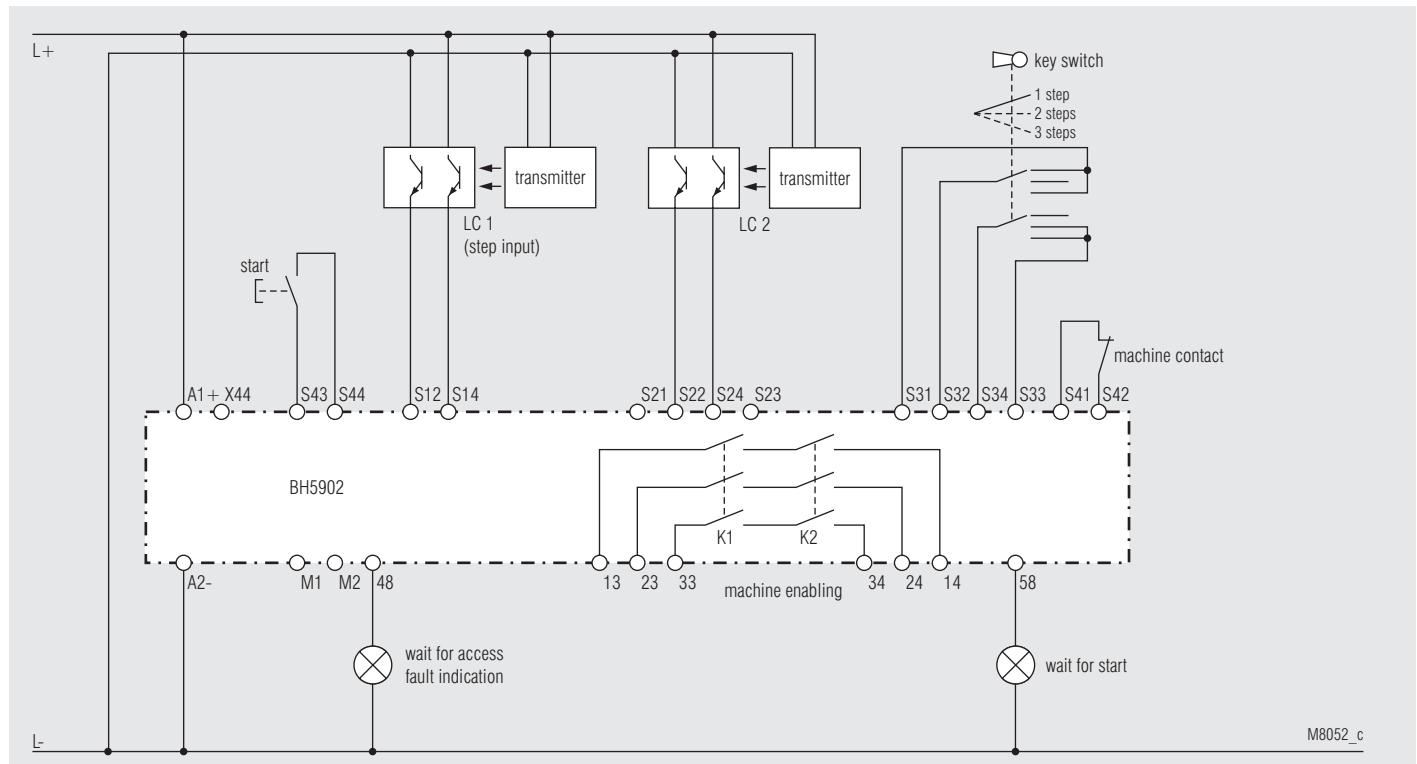

### Stepping operation with key switch

- e.g. Presses switch changing number of accesses
- selection with key switch: 1, 2 or 3 steps

### Enable new setting

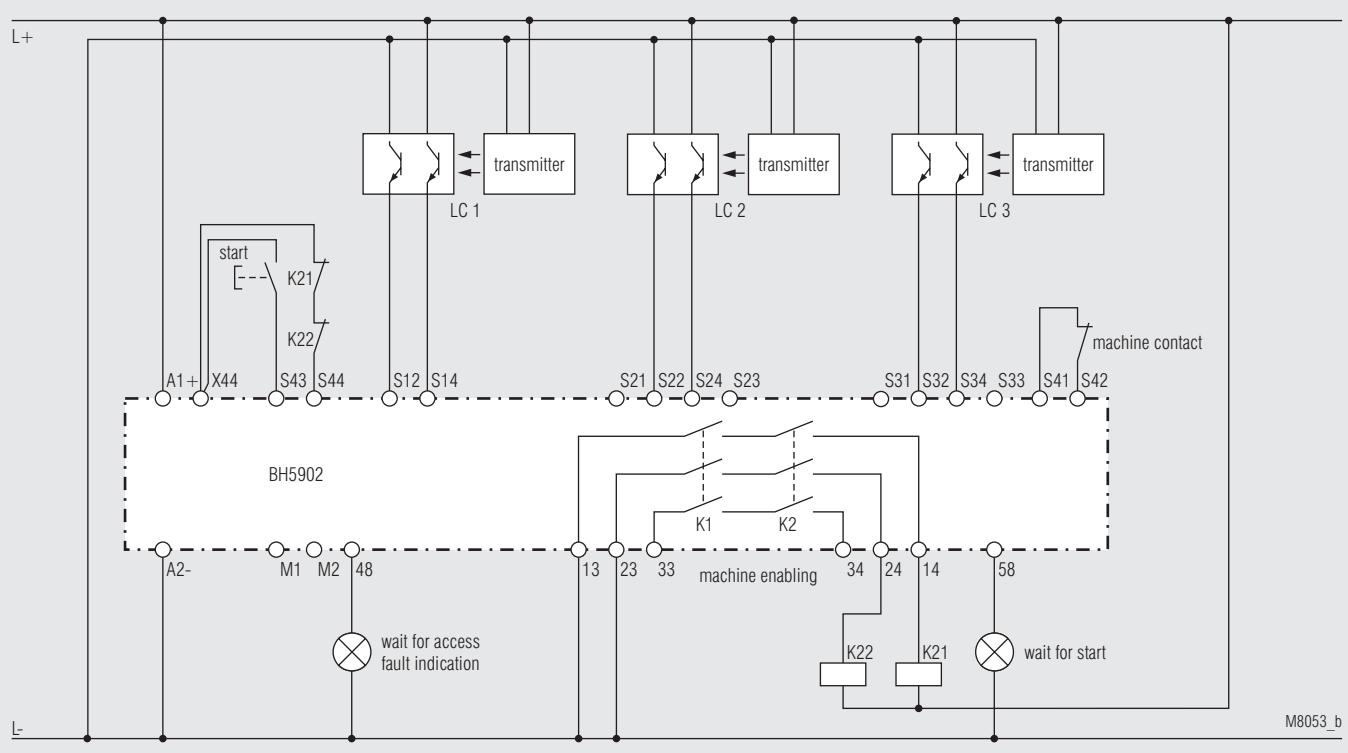

A changed number of steps is only recognised at standstill (K1 and K2 open).

A new number of steps is signalled by failure indication 3 on the lamp (terminal 48). Pressing the start button will restart the unit. After that the normal start sequence complete with start button and number of accesses must be completed to enable the machine with the new number of steps.

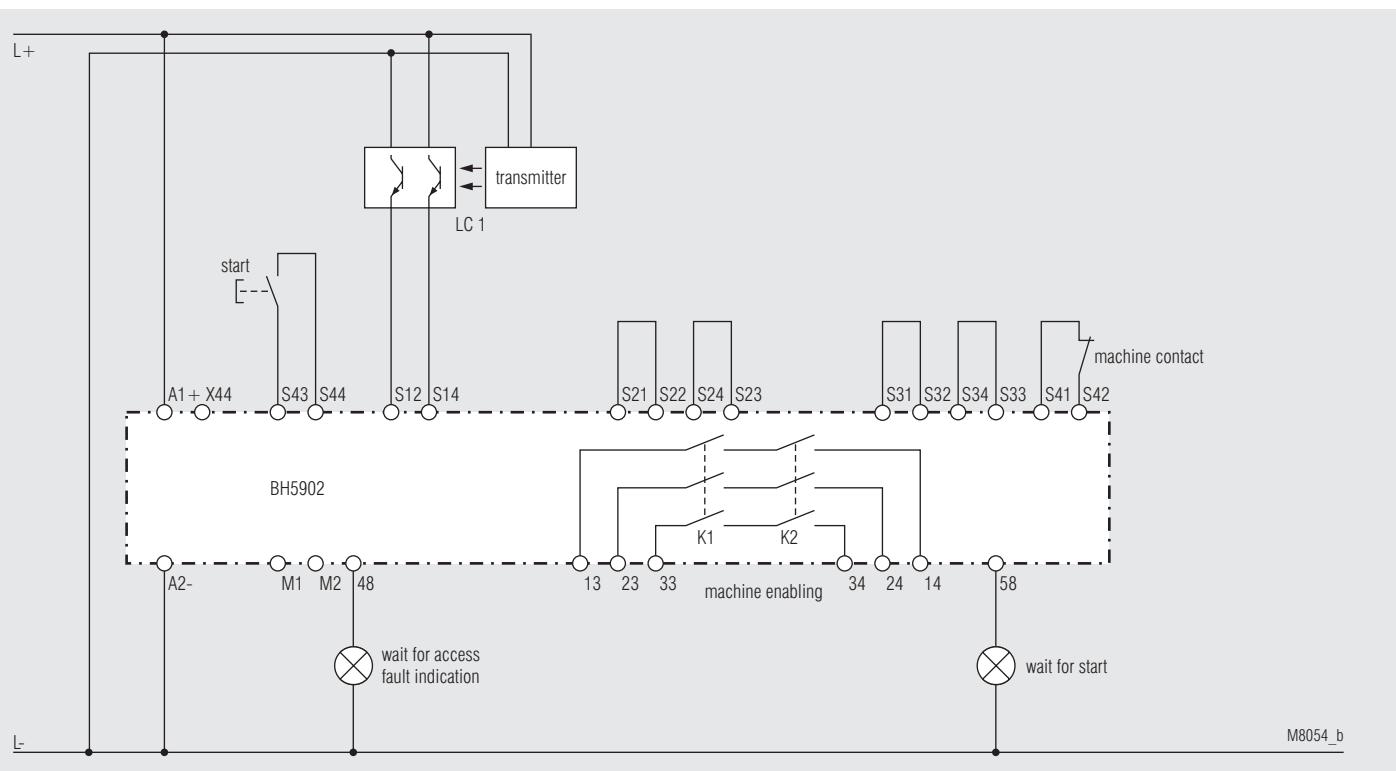

Picture 7: Stepping operation with key switch

## Application Examples

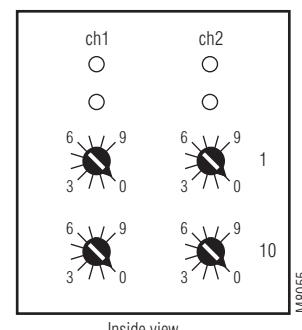

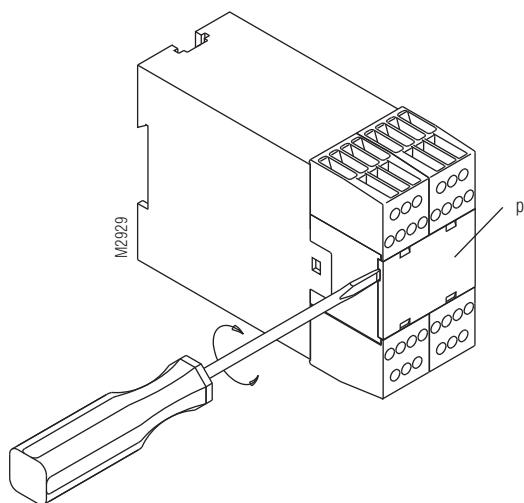

Picture 8: Stepping operation with 3 light curtains and contact reinforcement by external contactors, 2-channel operation (switching of feedback input can also be used at protective operation with muting)

The feed back circuit of the external relays is only tested when the module is started by pressing the push button. When using this circuit the safe function has to be tested in regular intervals. This can be done by interrupting a light curtain so that a reset requires activation of the start button. activating the module is only possible when all external relays are de-energized.

Picture 9: Stepping operation with one light curtain (with all different operating modes unused inputs must be linked).

## Setting

Inside view

M8055

### Example:

Required function: Protective operation with manual start, with muting, 4 muting sensors, max. 30 s muting time.

### Setting:

Upper switches set to "5" for both µprocessors

Lower switches set to "2" for both µprocessors

The function setting of BH 5902 is made by 4 rotational switches behind the frontplate (see picture). The switches on the left make the setting for µprocessor 1 (LED run 1) and the switches on the right for µprocessor (LED run 2). For both processors the same functions must be set. On the upper switches (1) the main function is adjusted. On the lower switches (10) the setting of the muting time (Protective operation) or the number of steps (stepping operation) is adjustable.

On muting or stepping function the light curtains LC 2 and LC 3 are always in protective operation with manual start.

### Protective operation without muting

Switch 10: Start mode and feedback input										
	0	1	2	3	4	5	6	7	8	9
without feedback input						with feedback input				
Switch 1	0	LC 1 LC 2 LC 3	Auto Manu Manu	Auto Auto Manu	Auto Auto Auto	not allowed (fault 5)	Auto Manu Manu	Auto Auto Manu	Auto Auto Auto	not allowed (fault 5)
	1	LC 1 LC 2 LC 3	Manu Manu Manu	Manu Auto Manu	Manu Auto Auto		Manu Manu Manu	Manu Auto Manu	Manu Auto Auto	

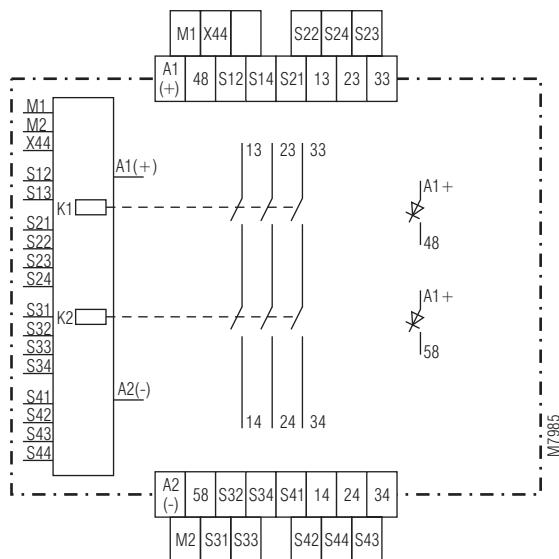

### Protective operation with muting

Switch 10: a = maximum muting time b = maximum synchronising time										
	0	1	2	3	4	5	6	7	8	9
Switch 1	2	LC S1 Auto, muting 2 sensors	a: 10 s / b: 3 s		a: 20 s / b: 3 s	a: 30 s / b: 3 s	a: 1 min / b: 6 s	a: 5 min / b: 30 s	a: 15 min / b: 90 s	a: 30 min / b: 3 min
	3	LC S1 Manu, muting 2 sensors								
	4	LC S1 Auto, muting 4 sensors								
	5	LC S1 Manu, muting 4 sensors								
			a: 8 h / b: 3 min		no muting time monitoring					

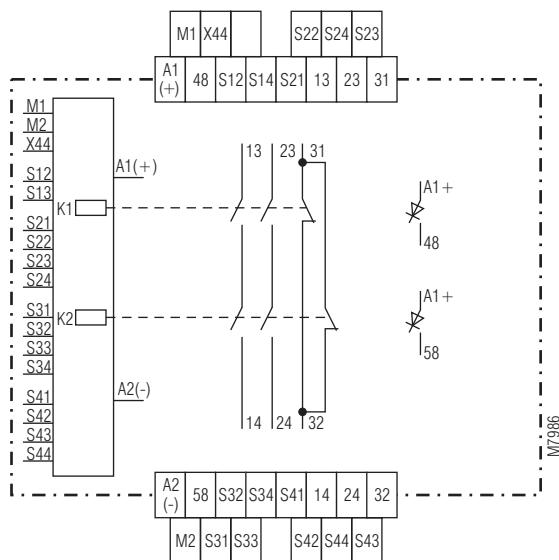

### Stepping operation

Switch 10: Number of steps					
	0	1	2	3	4 - 9
Switch 1	6	Stepping operation, contact type 1, Start-sequence: stepping and start	selectable by key switch		1 step
	7	Stepping operation, contact type 2, Start-sequence: stepping and start			2 step
	8	Stepping operation, contact type 1, Start-sequence: start and stepping			3 step
	9	Stepping operation, contact type 2, Start-sequence: start and stepping			not allowed (fault 5)

## Safety Related Data

### Values according to EN ISO 13849-1:

Category:	4	
MTTF <sub>d</sub> :	31.5	a
DC / DC <sub>avg</sub> :	98.9	%
d <sub>op</sub> :	220	d/a (days/year)
h <sub>op</sub> :	12	h/d (hours/day)
t <sub>Zyklus</sub> :	144	s/Zyklus

### Values according to IEC/EN 62061 / IEC/EN 61508:

SIL CL:	3	IEC/EN 62061
SIL	3	IEC/EN 61508
HFT:	1	
DC / DC <sub>avg</sub> :	98.9	%
SFF	99.6	%
PFH <sub>D</sub> :	7.80E-09	h <sup>-1</sup>

<sup>1) HFT = Hardware-Failure Tolerance</sup>

The values stated above are valid for the standard type.

Safety data for other variants are available on request.

The safety relevant data of the complete system has to be determined by the manufacturer of the system.

## UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL 508, "general use applications"

**Nominal voltage U<sub>N</sub>:** DC 24 V

**Ambient temperature:** 0 ... +50°C

**Switching capacity:**

Ambient temperature 50°C: Pilot duty B300  
5A 250Vac G.P.  
5A 24Vdc

Semiconductor outputs: 24Vdc, 100 mA

**Wire connection:** 60°C / 75°C copper conductors only  
AWG 20 - 12 Sol Torque 0.8 Nm  
AWG 20 - 14 Str Torque 0.8 Nm

Technical data that is not stated in the UL-Data, can be found in the technical data section.

## Standard Type

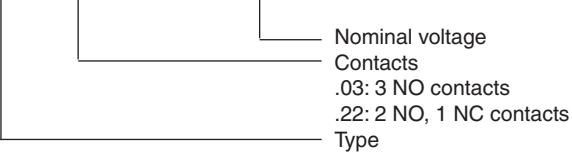

BH 5902.03/01MF2/61 DC 24 V

Article number: 0053847

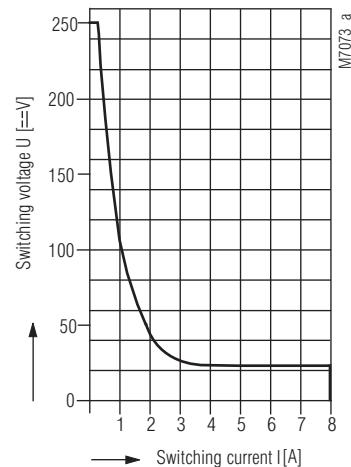

- Output: 3 NO contacts
- all functions settable via rotational switches
- Nominal voltage U<sub>N</sub>: DC 24 V
- Width: 45 mm

## Ordering Example

BH 5902 .\_\_ /01MF2/61 DC 24 V

## Characteristic

Arc limit curve

safe breaking, no continuous arcing under the curve, max. 1 switching cycle/s

## Flashing Codes For Status And Failure Indication

When a failure is detected the relays K1, K2 are de-energized. The different failures are indicated by different flashing codes on the LEDs run 1 and run 2. The failures are split into 2 groups.

### Failure group 1:

#### System failure

On occurrence of such a failure the unit locks out and shows the failure code, the module can only be reset by switching the unit off and on again. These failures are only indicated on LEDs run 1 and/or run 2. At the same time 2 different codes can be indicated on the 2 LEDs. The outputs (48 and 58) are always off in this state.

### Failure group 2:

#### Function failure

These failure codes are only displayed on LED run 1 and output 48 while LED run 2 remains on permanently.

The relays K1, K2 are de-energized in this state, the module is still active and the relays can be activated by pressing the start button after the failure has been removed.

#### System failure: (indicated only on LEDs run 1 and/or run 2)

No.*)	Description	Measures and notes
0	internal failure (LEDs off)	If both LEDs are off the relay is defective and has to be sent back for examination.
5	Faulty setting	1) The switches on both channels are not identically 2) The selected setting is not allowed.
6	Undervoltage detection	Left LED is flashing when the voltage drops under the allowed level (< approx. 0.85 UN). After returned to normal a reset is made (similar to power up of the unit).
6	Oversupply detection	The right LED is flashing when the voltage rises over the allowed level of > approx. 1,15 UN + 5 % residual ripple.
7	Input failure	1) A short circuit occurred on the start button or machine contact input. 2) Both signals of one LC are not identically (short circuit, broken wire of defective LC)
8	Failure on output contacts K1, K2	Please check the output K1, K2 circuit and contact current, relay has to be repaired.
9	Internal failure	Please try to evaluate the circumstances that led to this fault and check with the supplier or manufacturer.
11		
12	Internal failure	The relay has to be repaired.
13		

\*) No.: number of flash pulses in a series

## Flashing Codes For Status And Failure Indication

#### Function failure: indication on LED run 1 and output 48

No.*)	Description	Measures and notes
1	LC failure	1) One LC has been interrupted. 2) All LC inputs that are not used must be bridged: LC 2: S21-S22, S23-S24 LC 3: S31-S32, S33-S34
2	Failure on start button	1) During start up of the unit and initialising the start button must not be pressed 2) The start button must not be pressed longer than 3 s.
3	Protective operation failure in feed back circuit	1) An operating mode with feed back circuit 1st selected and the circuit connected to S41-S42 is not closed before activation of K1, K2. 2) The machine contact is not closed in initial position (waiting for start) 3) With contact type 1 the machine contact was not closed at the end of the required first interruption of the light curtain.
3	Stepping operation contact failure	1) The machine contact is not closed in initial position (waiting for start) 2) With contact type 1 the machine contact was not closed at the end of the required first interruption of the light curtain.
4	Muting failure (blocked LC)	1) The selected max. muting time had been exceeded (muting lamp on). 2) The muting lamp is not connected between terminals 48 and M1 and M2. 3) The necessary bridge is not connected between terminal S41-S42.. 4) The muting lamp is defective. 5) The measuring circuit for the muting lamp is defective, the unit has to be repaired.
4	Muting failure (lamp)	1) The selected max. muting time had been exceeded (muting lamp on). 2) The muting lamp is not connected between terminals 48 and M1 and M2. 3) The necessary bridge is not connected between terminal S41-S42.. 4) The muting lamp is defective. 5) The measuring circuit for the muting lamp is defective, the unit has to be repaired.
5	Stepping operation (key failure)	1) Both contacts of the key switch to select the number of steps are open

\*) No.: number of flash pulses in a series

#### Status indication

run 1 and output 48 are flashing fast with 3 Hz	Minimum one muting sensor is active, LC 1 is interrupted and the start button is pressed. After 3 s with activated start button the override is started for max. 12 s.
Muting operation: Override possible	The unit is waiting for the required number of interruptions of the LC so that the safety relays can be activated.

# Safety Technique

**SAFEMASTER**  
Two-Hand Safety Relay  
BG 5933, BH 5933

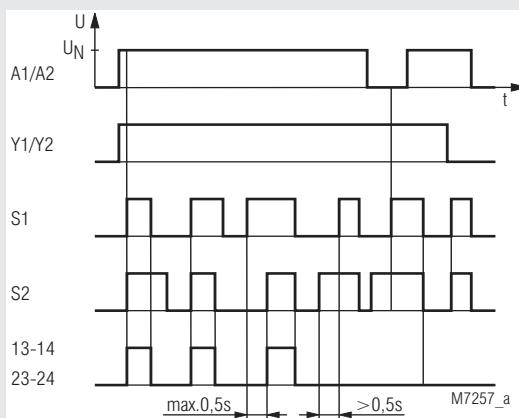

**DOLD** 

## Product Description

The BG 5933 or BH 5933 enables and disables a safety circuit in a safe way. It is used to protect people and machines in applications with 2-hand buttons on presses for metal products as well as for other production machinery with dangerous closing movements.

## Function Diagram

- 1.) "S1, S2 activated" means, NC open and NO closed
- 2.) activated S1, switches "+"-potential
- 3.) activated S2, switches "-"-potential

## Your Advantage

- Compact, ready to connect 2-hand safety circuit
- Cost reduction by replacing conventional contactor circuits
- Feedback circuit Y1 - Y2 to monitor external contactors used for reinforcement of contacts
- EC-type examined circuit according to the requirements of the health and safety authorities

## Features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508
  - Safety Level Type III-C according to EN 574
  - the safety regulations for two-hand controls on power-operated presses in metalworking ZH 1-456
- Inputs for 2 push buttons with 1 NC and 1 NO contact
- Output:
  - 2 NO contacts, 1 NC contact or
  - 3 NO contacts, 1 NC contact
- Overvoltage and short circuit protection
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled (isolated), DIN 46 228-1/-2/-3/-4 or 2 x 2.5 mm<sup>2</sup> stranded ferruled DIN 46 228-1/-2/-3
- BG 5933: width 22.5 mm
- BH 5933: width 45 mm

## Approvals and Markings

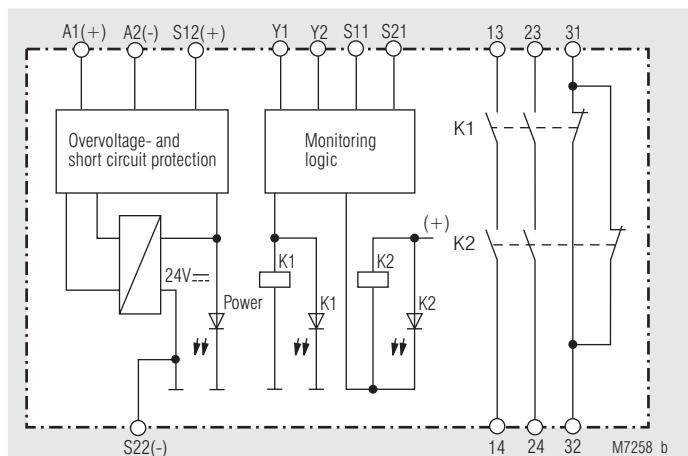

## Applications

Designed for press controls in metalworking as well as in other working machines with dangerous closing movements.

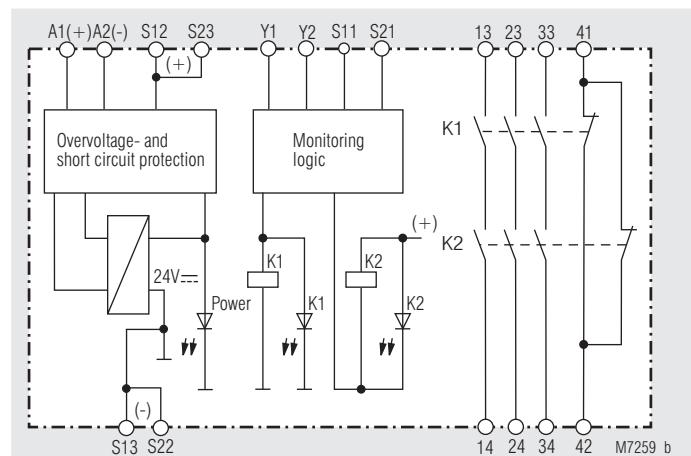

## Indication

- LED power-supply: on, when operating voltage applied
- LED K1: on, when relay K1 active
- LED K2: on, when relay K2 active

## Block Diagram

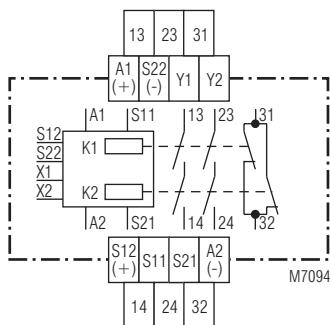

BG 5933

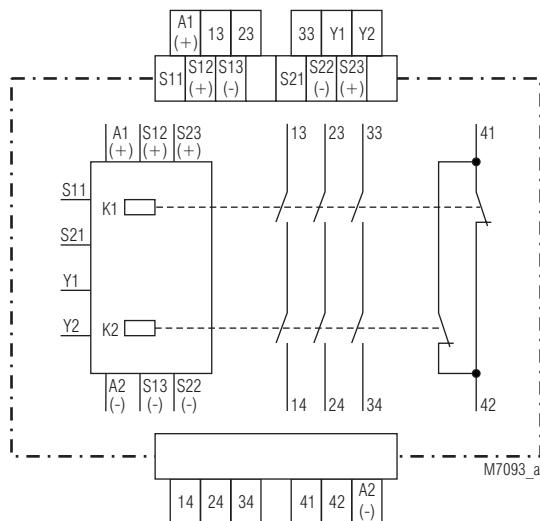

BH 5933

## Circuit Diagrams

BG 5933.22

BH 5933.48

## Connection Terminals

Terminal designation	Signal description
A1 (+)	+ / L
A2 (-)	- / N
S11, S21, Y1, Y2	Inputs
S12(+), S13(-), S22(-), S23(+)	Outputs
13, 14, 23, 24, 33, 34	Forcibly guided NO contacts for release circuit
31, 32, 41, 42	Forcibly guided indicator output

## Notes

If both buttons are pressed while switching on the operating voltage (e.g. after voltage failure) the output contacts do not energize.  
The terminal S22 also serves as reference point for checking the control voltage.  
On BG 5933 there is only one terminal S12 and S22.

## Set-Up Instructions

The device has to be connected as shown in the application examples. When connecting the push-buttons in parallel or in series the safe function of the relay is disabled. Connected contactors (relays) must have forcibly guided contacts and have to be monitored in the feedback circuit. To start a dangerous movement, 2 push buttons are used, each equipped with 1 NO and 1 NC contact. The output contacts will be switched if both push buttons are operated within  $\leq 0.5$  s. The buttons must be designed and installed in a way, that it is not possible to manipulate or to operate them without intention.

The distance between push buttons and dangerous area must be chosen in a way that it is not possible to reach the dangerous area after release of one button before the dangerous movement comes to standstill.

The safety distance "s" is calculated with the following formula:  
 $s = v \cdot t + C$

- a) moving speed of person  $v = 1\,600$  mm/s
- b) stopping time of the machine  $t$  (s)
- c) Additional safety distance  $C = 250$  mm

If the risk of accessing the dangerous area is prohibited while the push buttons are pressed e.g. by covering the buttons,  $C$  can be 0. The minimum distance has to be in this case 100 mm. See also EN 574.

AWG 20 - 14 Str Torque 0.8 Nm

Technical data that is not stated in the UL-Data, can be found in the technical data section.

### Standard Types

#### BG 5933.22/61 DC 24 V

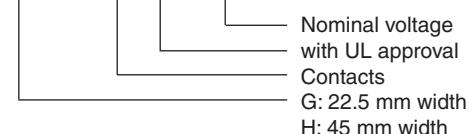

Artikelnummer:	0063397
• Ausgang:	2 Schließer, 1 Öffner
• Nennspannung $U_N$ :	DC 24 V
• Baubreite:	22,5 mm

#### BH 5933.48/61 AC 230 V

Artikelnummer:	0061926
• Ausgang:	3 Schließer, 1 Öffner
• Nennspannung $U_N$ :	AC 230 V
• Baubreite:	45 mm

## Ordering example

B\_ 5933 .22 /61 DC 24 V

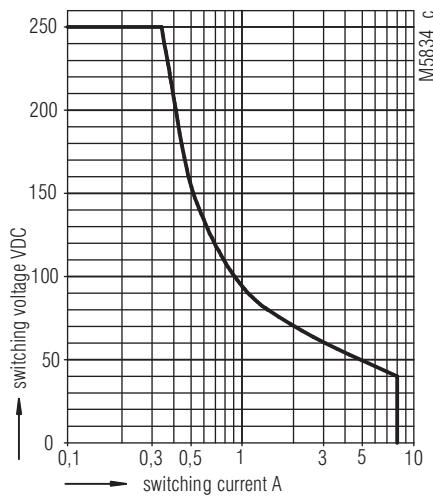

### Troubleshooting

Failure	Potential cause
LED "Power" does not light up	Power supply not connected
LED "K1" lights up, but "K2" remains off or	- Safety relay K1 e.g. K2 is welded (replace device) - The 2-Hand-buttons have not been operated simultaneously within ≤ 0,5s
LED "K2" lights up, but "K1" remains off	
Device cannot be activated	- Safety relay is welded (replace device) - Feedback circuit Y1-Y2 not closed - The 2-Hand-buttons have not been operated simultaneously within ≤ 0,5s

### Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

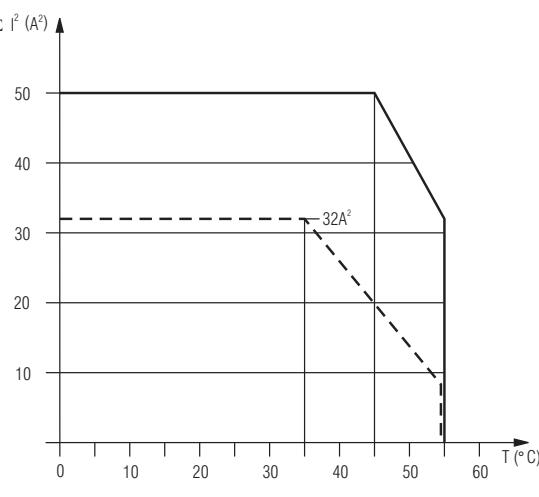

## Characteristics

safe breaking, no continuous arcing,  
max. 1 switching cycle / s

Limit curve for arc-free operation with resistive load

## SAFEMASTER Two-Hand Safety Relay LG 5933

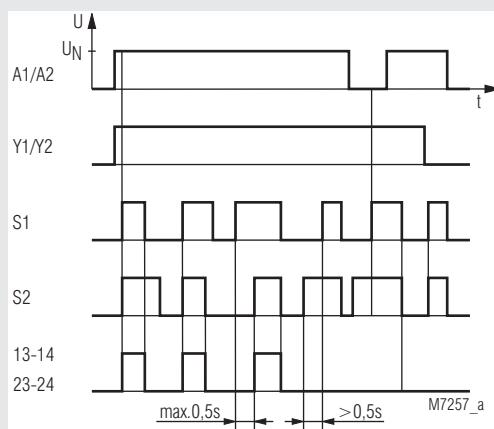

0249758

### Product Description

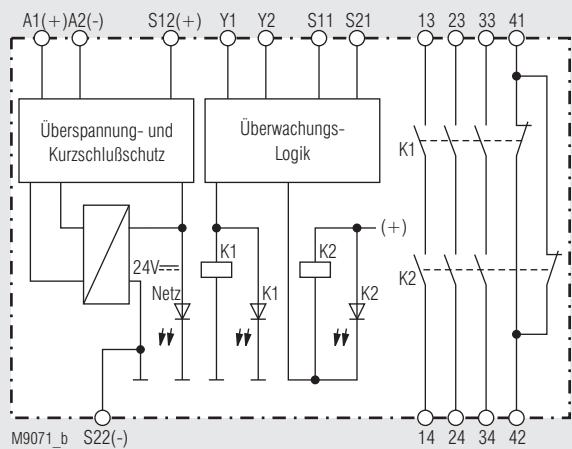

The LG 5933 enables and disables a safety circuit in a safe way. It is used to protect people and machines in applications with 2-hand buttons on presses for metal products as well as for other production machinery with dangerous closing movements.

### Function Diagram

- 1.) "S1, S2 activated" means, NC open and NO closed
- 2.) activated S1, switches " $+$ "-potential
- 3.) activated S2, switches " $-$ "-potential

### Block Diagram

### Your Advantage

- Compact, ready to connect 2-hand safety circuit
- Cost reduction by replacing conventional contactor circuits
- Feedback circuit  $Y1 - Y2$  to monitor external contactors used for reinforcement of contacts
- EC-type examined circuit according to the requirements of the health and safety authorities
- As option with pluggable terminal blocks for easy exchange of devices

### Features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508
  - Safety level Type III-C to EN 574
- Inputs for 2 push buttons with 1 NC and 1 NO contact
- Output: 3 NO contacts, 1 NC contact
- Overvoltage and short circuit protection
- Wire connection: also  $2 \times 1.5 \text{ mm}^2$  stranded ferruled, or  $2 \times 2.5 \text{ mm}^2$  solid DIN 46 228-1/-2/-3/-4
- Removable terminal strips
  - LG 5933: fixed screw terminals
  - LG 5933 PS: plug in screw terminals
  - LG 5933 PC: plug in cage clamp terminals
- Width 22.5 mm

### Approvals and Markings

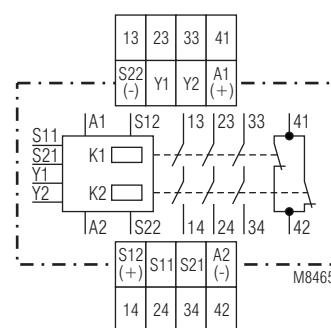

### Applications

Designed for press controls in metalworking as well as in other working machines with dangerous closing movements.

### Indication

- |                   |                                    |
|-------------------|------------------------------------|
| LED power-supply: | on, when operating voltage applied |
| LED K1:           | on, when relay K1 active           |
| LED K2:           | on, when relay K2 active           |

### Circuit Diagram

Connection Terminals		Technical Data
Terminal designation	Signal description	Input
A1 (+)	+ / L	Nominal voltage $U_N$ : AC 24 V, DC 24 V
A2 (-)	- / N	Voltage range at 10 % residual ripple: AC / DC 0.9 ... 1.1 $U_N$
S11, S21, Y1, Y2	Inputs	Nominal consumption: AC approx. 4 VA
S12(+), S22(-)	Outputs	DC approx. 2.3 W
13, 14, 23, 24, 33, 34	Forcibly guided NO contacts for release circuit	50 / 60 Hz
41, 42	Forcibly guided indicator output	max. 0.5 s

Notes	Recovery time:
If both buttons are pressed while switching on the operating voltage (e.g. after voltage failure) the output contacts do not energize.	1 s
The terminal S22 also serves as reference point for checking the control voltage.	2 x (1 NO, 1 NC contacts)
On LG 5933 there is only one terminal S12 and S22.	

Set-Up Instructions	Output
The device has to be connected as shown in the application examples. When connecting the push-buttons in parallel or in series the safe function of the relay is disabled. Connected contactors (relays) must have forcibly guided contacts and have to be monitored in the feedback circuit.	
To start a dangerous movement, 2 push buttons are used, each equipped with 1 NO and 1 NC contact. The output contacts will be switched if both push buttons are operated within $\leq 0.5$ s. The buttons must be designed and installed in a way, that it is not possible to manipulate or to operate them without intention.	
The distance between push buttons and dangerous area must be chosen in a way that it is not possible to reach the dangerous area after release of one button before the dangerous movement comes to standstill.	
The safety distance "s" is calculated with the following formula: $s = v \times t + C$	
a) moving speed of person $v = 1\,600$ mm/s b) stopping time of the machine $t$ (s) c) Additional safety distance $C = 250$ mm	
If the risk of accessing the dangerous area is prohibited while the push buttons are pressed e.g. by covering the buttons, $C$ can be 0. The minimum distance has to be in this case 100 mm. See also EN 574.	

The safety distance "s" is calculated with the following formula:  
 $s = v \times t + C$

- a) moving speed of person  $v = 1\,600$  mm/s
- b) stopping time of the machine  $t$  (s)
- c) Additional safety distance  $C = 250$  mm

If the risk of accessing the dangerous area is prohibited while the push buttons are pressed e.g. by covering the buttons,  $C$  can be 0. The minimum distance has to be in this case 100 mm. See also EN 574.

General Data	
<b>Nominal operating mode:</b>	continuous operation

## SAFEMASTER Two-Hand Safety Relay BD 5980N

**DOLD** 

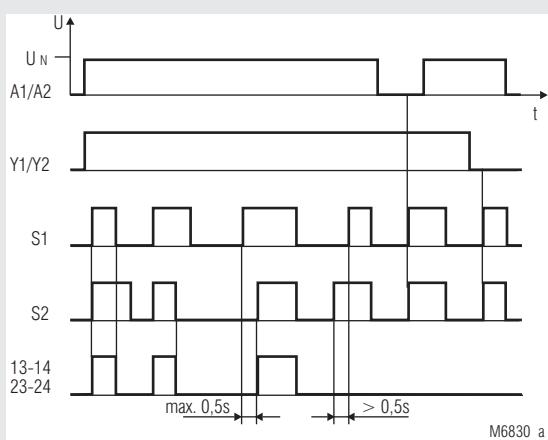

0221551

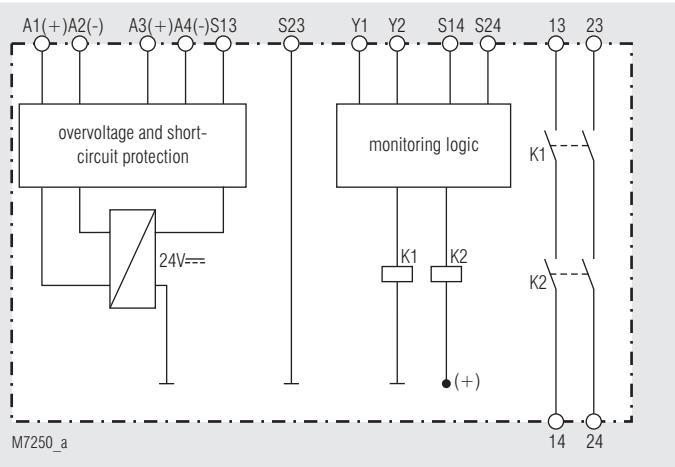

### Product Description

The BD 5980N enables and disables a safety circuit in a safe way. It is used to protect people and machines in applications with 2-hand buttons on presses for metal products as well as for other production machinery with dangerous closing movements according to EN 574 Kategorie III A.

### Function Diagram

### Block Diagram

### Features

- According to
  - Performance Level (PL) c and category 1 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 1 to IEC/EN 62061
  - Safety Integrity Level (SIL) 1 to IEC/EN 61508
  - Safety niveau Typ III-A according to EN 574
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled (isolated), DIN 46 228-1/-2/-3/-4 or 2 x 2.5 mm<sup>2</sup> stranded ferruled DIN 46 228-1/-2/-3
- Optionally dual-voltage version
- Width 45 mm

### Approvals and Markings

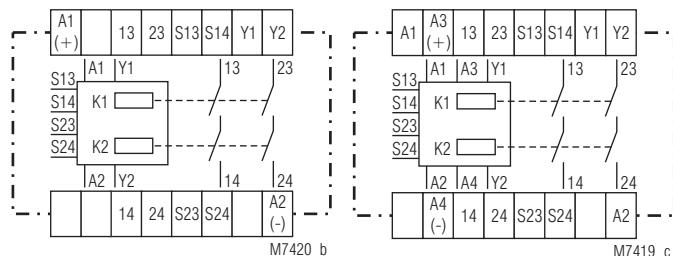

\* see variants

### Application

Designed for use in press controls in metalworking as well as in other working machines with dangerous closing movements.

### Circuit Diagrams

BD 5980N.02

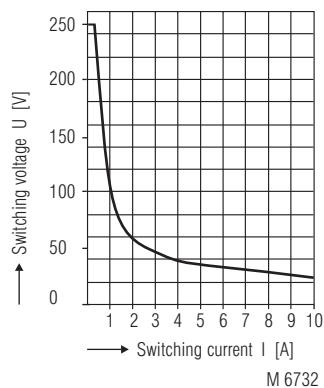

BD 5980N.02/024

### Connection Terminals

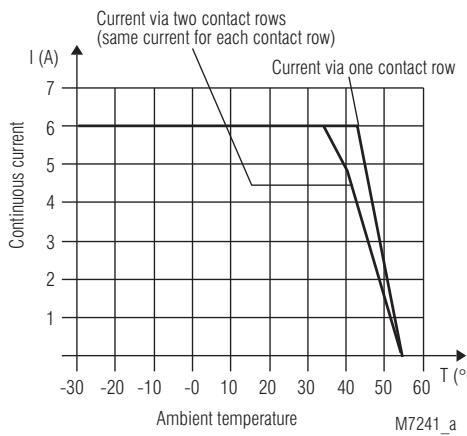

Terminal designation	Signal description

BD 5980N .02 /024 DC 24 V + AC 230 V 50/60 Hz		
<b>Troubleshooting</b>		
<b>Failure</b>		<b>Potential cause</b>
Device cannot be activated		- Power supply not connected - A safety relay is welded (replace device) - Feedback circuit Y1-Y2 not closed - The 2-Hand-buttons have not been operated simultaneously within ≤ 0,5s
<b>Maintenance and repairs</b>		
-		The device contains no parts that require maintenance.
-		In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristics

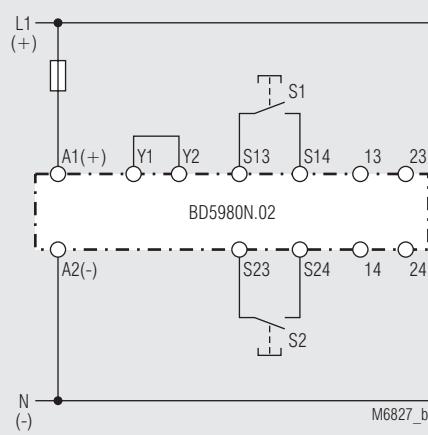

Limit curve for arc-free operation with resistive load

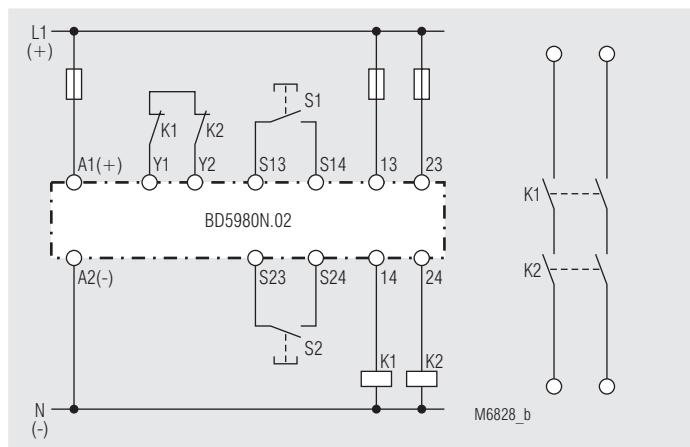

Continuous current limit curve as a function of ambient temperature

## Application Examples

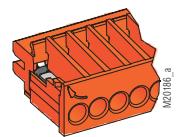

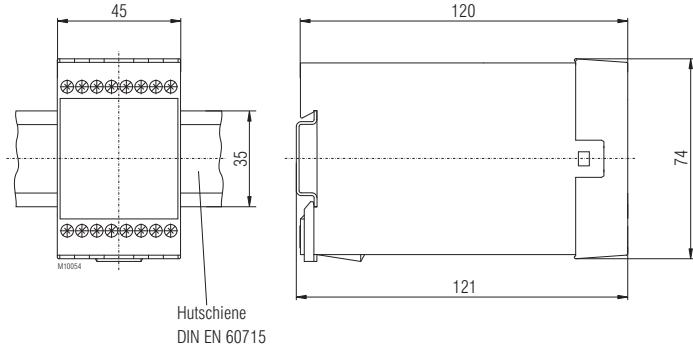

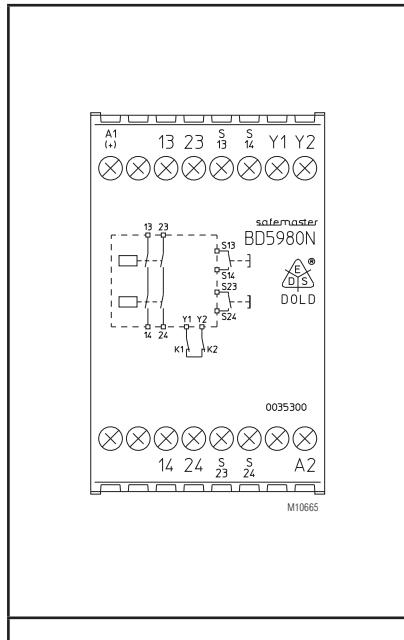

Two-hand control  
Suited up to SIL1, Performance Level c, Cat. 1

Two-hand control with contact reinforcement via external forcibly guided contactors.  
Suited up to SIL1, Performance Level c, Cat. 1

## Function Diagram

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508
- Safety-mat switch gear with manual or automatic restart
- Can also be used for safety edges
- Output: max. 3 NO contacts
- Line fault detection on On-button
- Manual restart or automatic restart when connecting the supply voltage, switch S2
- LED indicator for state of operation
- Indicator for status of switching element
- LED indicator for channel 1 and 2
- Removable terminal strips
- Wire connection: also 2 x 1,5 mm<sup>2</sup> stranded ferruled (isolated), DIN 46 228-1/-2/-3/-4 or 2 x 2,5 mm<sup>2</sup> stranded ferruled DIN 46 228-1/-2/-3/-4
- Width 22,5 mm

## Approvals and Markings

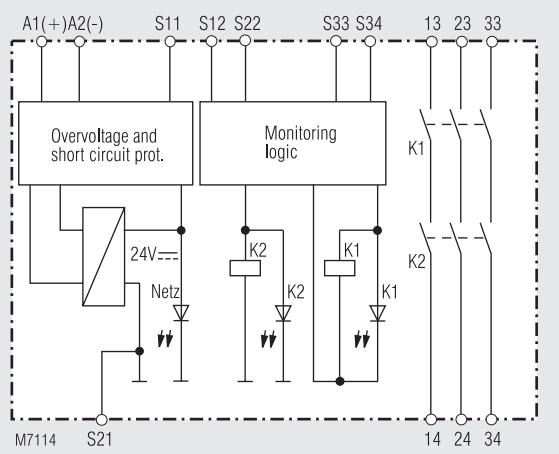

## Applications

Protection of people and machines

- Emergency stop circuits on machines
- Monitoring of safety gates
- Switch gear for lightbars
- Switch gear for safety mats and safety edges

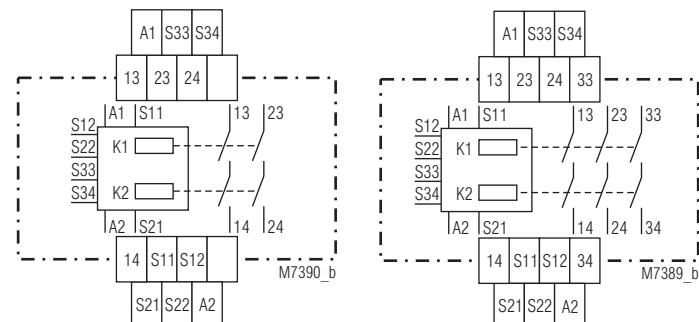

## Block Diagram

## Indicators

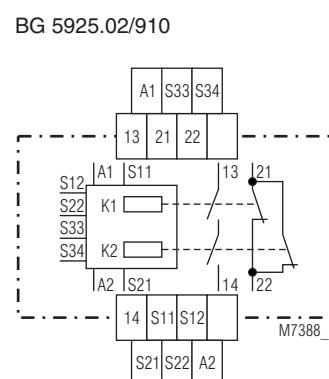

- upper LED: ON when supply connected  
 lower LEDs: ON when relay K1 and K2 energized

## Circuit Diagrams

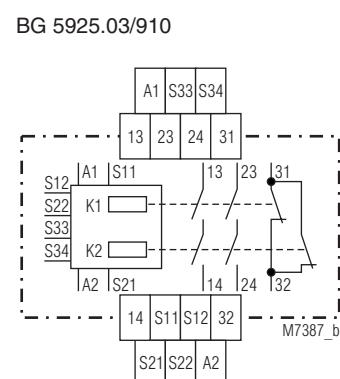

## Connection Terminals

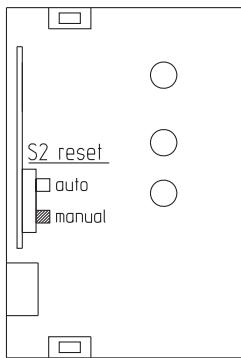

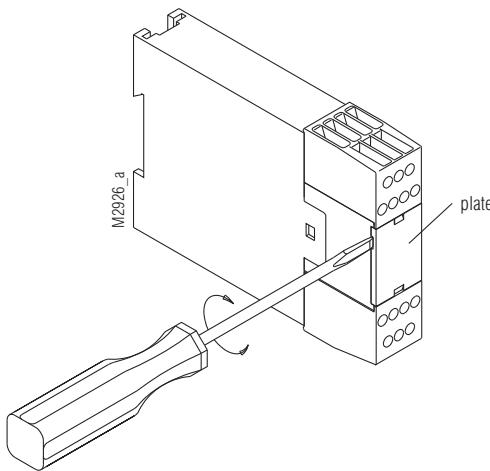

Terminal designation	Signal description
A1 (+)	+ / L
A2 (-)	- / N
S12, S22, S34	Inputs
S11, S21, S33	Outputs
13, 14, 23, 24, 33, 34	Positive driven NO contacts for release circuit
21, 22, 31, 32	Positive guided indicator output

BG 5925.16/910

## Unit Programming

M6374

Drawing shows setting at the state of delivery

## Notes

**Line fault detection on On-button:**

The line fault detection is only active when S12 and S22 are switched simultaneously. If the On-button is closed before S12, S22 is connected to voltage (also when line fault across On-Button), the output contacts will not close.

A line fault across the On-button which occurred after activation of the relay, will be detected with the next activation and the output contacts will not close. If a line fault occurs after the voltage has been connected to S12, S22, the unit will be activated because this line fault is similar to the normal On-function. The gold plated contacts of the BG 5925 mean that this module is also suitable for switching small loads of 1 mVA - 7 VA, 1 mW - 7 W in the range 0,1 - 60 V, 1 - 300 mA. The contacts also permit the maximum switching current. However since the gold plating will be burnt off at this current level, the device is no longer suitable for switching small loads after this.

The terminal S21 permits the operation of the device in IT-systems with insulation monitoring, serves as a reference point for testing the control voltage.

Connecting the terminal S21 to the protective ground bridges the internal short-circuit protection of Line A2 (-). The short-circuit protection of line A1 (+) remains active.

With the model BG 5925/910 control unit for safety mats, the switch S1 must always be set to cross fault monitoring. Depending on the operation of the machine, the switch S2 is set to automatic or manual restart.

## Technical Data

### Input circuit

<b>Nominal Voltage <math>U_N</math>:</b>	DC 24 V
<b>Voltage range</b>	0,9 ... 1,1 $U_N$
at 10% residual ripple:	DC approx. 2 W
<b>Nominal consumption:</b>	1 s
<b>Min. Off-time:</b>	approx. DC 23 V at $U_N$
<b>Control voltage on S11:</b>	30 $\Omega$
<b>Max. permissible contact resistance of safety mat:</b>	
<b>Cross fault current</b>	
between line S11-S12 and line S21-S22 with active safety mat or safety edge	
start-up:	max. 0,4 A for approx. 2 ms
continuously:	approx. 29 mA at $U_N$
<b>Control current over S12, S22:</b>	40 mA at $U_N$
<b>Min. voltage between terminals S12, S22 and S21:</b>	DC 21 V when relay activated and $U_N$ on A1 - A2
<b>Short-circuit protection:</b>	Internal fuse rating
<b>Oversupply protection:</b>	Internal VDR

### Output

#### Contacts

<b>BG 5925.02/910:</b>	2 NO contacts
<b>BG 5925.03/910:</b>	3 NO contact
<b>BG 5925.16/910:</b>	1 NO, 1 NC contact
<b>BG 5925.22/910:</b>	2 NO, 1 NC contact

The NO contacts are safety contacts.

**The NC contacts 21-22 or 31-32 can only be used for monitoring.**

#### Operate delay typ. at $U_N$ :

Manual start:	40 ms
Automatic start:	200 ms

#### Release delay typ. at $U_N$ :

Disconnecting the supply:	50 ms
Disconnecting S12, S22:	15 ms

#### Contact type:

forcibly guided

AC 250 V

DC: see limit curve for arc-free operation

$\geq 100$  mV

$\geq 1$  mA

5 A

(see current limit curve)

**Switching of low loads:**

(contact 5  $\mu$  Au)

#### Thermal current $I_{th}$ :

**Switching capacity**

to AC 15

NO contact: 3 A / AC 230 V IEC/EN 60 947-5-1

NC contact: 2 A / AC 230 V IEC/EN 60 947-5-1

to DC 13:

NO contact: 1 A / DC 24 V IEC/EN 60 947-5-1

NC contact: 1 A / DC 24 V IEC/EN 60 947-5-1

#### Electrical contact life

to AC 15 at 2 A, AC 230 V:  $10^5$  switching cycles IEC/EN 60 947-5-1

to DC 13 at 1 A, DC 24 V:  $> 150 \times 10^3$  switching cycles

**Permissible operating frequency:** max. 1 200 operating cycles / h

**Short circuit strength:** max. fuse rating: 6 A gL IEC/EN 60 947-5-1

line circuit breaker: C 8 A

**Mechanical life:**  $10 \times 10^6$  switching cycles

## Technical Data

### General Data

<b>Operating mode:</b>	Continuous operation
<b>Temperature range operation:</b>	- 15 ... + 55 °C
<b>storage :</b>	- 25 ... + 85 °C
<b>altitude:</b>	< 2.000 m
<b>Clearance and creepage distances</b>	
rated impuls voltage / pollution degree:	4 kV / 2 (basis insulation) IEC 60 664-1 IEC/EN 62 061
<b>EMC</b>	Limit value class B EN 55 011
Interference suppression:	
<b>Degree of protection</b>	
Housing:	IP 40 IEC/EN 60 529
Terminals:	IP 20 IEC/EN 60 529
<b>Housing:</b>	Thermoplastic with V0 behaviour according to UL subject 94
<b>Vibration resistance:</b>	Amplitude 0,35 mm IEC/EN 60 068-2-6 frequency 10 ... 55 Hz
<b>Climate resistance:</b>	15 / 055 / 04 IEC/EN 60 068-1
<b>Terminal designation:</b>	EN 50 005
<b>Wire fixing:</b>	Box terminal with wire protection, removable terminal strips
<b>Mounting:</b>	DIN rail IEC/EN 60 715
<b>Weight:</b>	220 g

### Dimensions

**Width x height x depth:** 22,5 x 84 x 121 mm

### UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL 508, "general use applications"

<b>Nominal voltage U<sub>N</sub>:</b>	DC 24 V
<b>Ambient temperature:</b>	-15 ... +55°C
<b>Switching capacity:</b>	
Ambient temperature 25°C	Pilot duty B300 5A 250Vac Resistive 5A 24Vdc Resistive or G.P.
Ambient temperature 55°C:	Pilot duty B300 3A 250Vac Resistive 3A 24Vdc Resistive or G.P.
<b>Wire connection:</b>	60°C / 75°C copper conductors only AWG 20 - 12 Sol Torque 0.8 Nm AWG 20 - 14 Str Torque 0.8 Nm

Technical data that is not stated in the UL-Data, can be found in the technical data section.

### Standard Type

BG 5925.02/910/61 DC 24 V

Article number:	0049869
• Output:	2 NO contacts
• Nominal voltage U <sub>N</sub> :	DC 24 V
• Width:	22,5 mm

### Ordering Example

BG 5925 .\_\_\_. /910 /61 DC 24 V

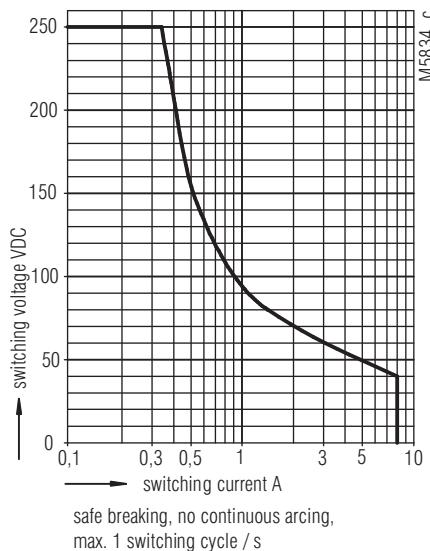

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	Power supply not connected
LED "K1" lights up, but "K2" remains off	- Safety relay K1 is welded (replace device) - A 1-channel switch-off occurred on S12 (switch channel off on S22)
LED "K2" lights up, but "K1" remains off	- Safety relay K2 is welded (replace device) - A 1-channel switch-off occurred on S22 (switch channel off on S12)
Device cannot be activated	- Safety relay K2 is welded (replace device) - Incorrect setting of switch S2 - Manual start mode: Line fault on start-button (disconnect power supply and remove fault) - Automatic start mode: S33-S34 not bridged

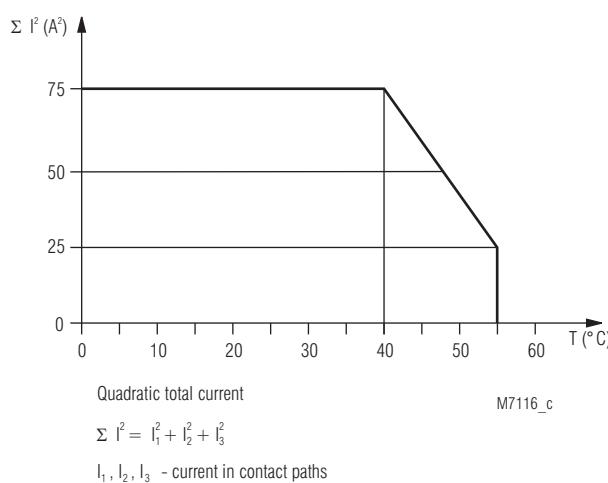

### Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristics

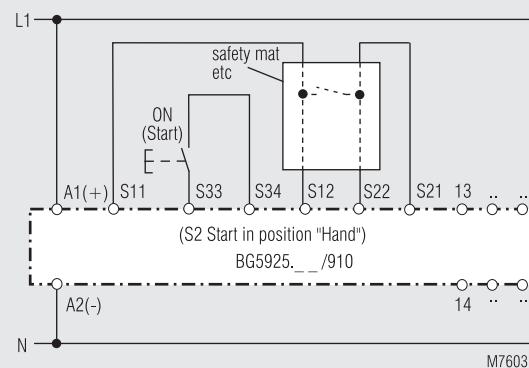

Arc limit curve under resistive load

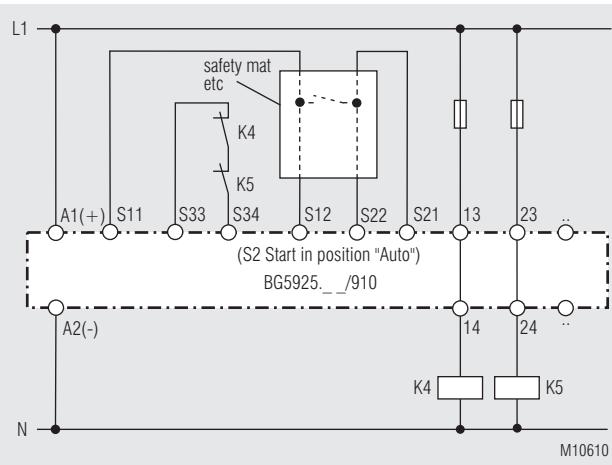

Quadratic total current limit curve

## Application Examples

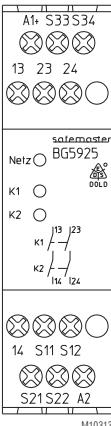

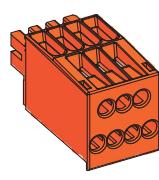

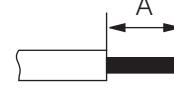

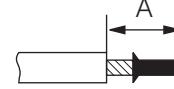

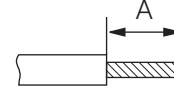

Switch gear for safety mats and edges  
switch S2 position: Manual start  
(For automatic restart S2 in position Autostart and link on S33-S34)  
Suited up to SIL3, Performance Level e, Cat. 4

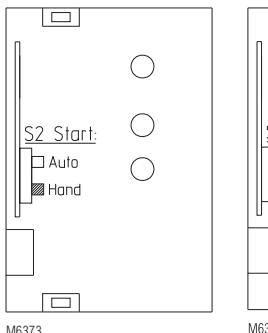

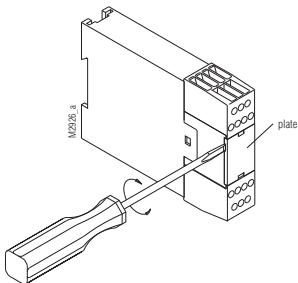

Switch gear for safety mats and edges  
Contact reinforcement by external contactors, 2-channel.  
switch S2 position: Auto start  
Suited up to SIL3, Performance Level e, Cat. 4

**SAFEMASTER**  
**Safety Edge Module**  
**LG 5944**

**DOLD** 

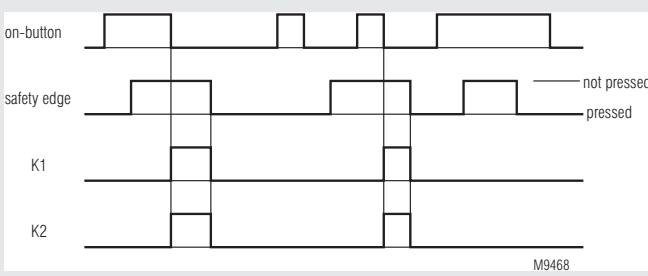

0270982

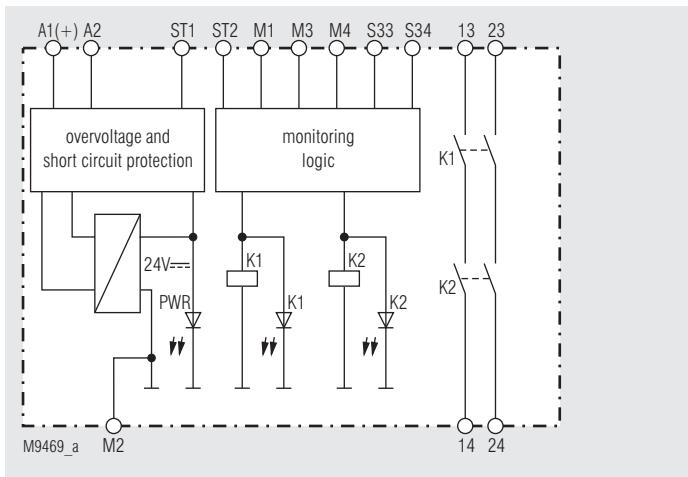

## Product Description

The safety edge module LG 5944 monitors safety edges with a permitted switching current of  $\geq 10\text{mA}$ . It enables or disables a safety circuit and can be used to protect men and machine. To avoid a damage of the safety edges by excessive currents, the current provided by the LG 5944 is limited to 10 mA even in the case of a short circuit.

## Function Diagram

## Block Diagram

## Your Advantages

- Current limitation protects the connected safety edge against electrical destruction by overcurrent and short circuit
- Universal usage with safety edges with different allowed switching currents (also for lower switching currents)
- Pluggable terminal blocks for easy exchange

## Features

- According to
  - Performance Level (PL) e and category 3 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508
- According to IEC/EN 60 204-1
- Output: 2 redundant safety outputs
- Line fault detection on On-button
- Manual restart or automatic restart, switch S2
- Indication for operating condition
- LED indicator for channel 1 and 2
- As option with pluggable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width: 22.5 mm

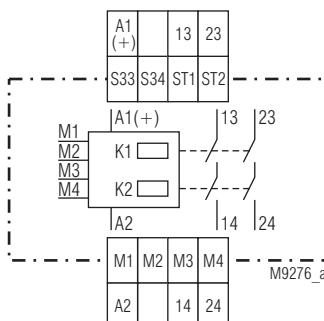

## Approvals and Markings

## Indicators

- green LED PWR: on when supply connected  
green LED K1: on when relay K1 energized  
green LED K2: on when relay K2 energized

## Circuit Diagram

## Connection Terminals

Terminal designation	Signal description
A1 (+)	+ / L
A2	- / N
M1, M2, M3, M4	Measuring input
ST1, ST2	Connections for On-button
S33, S34	Connections for Test-button
13, 14, 23, 24	Forcibly guided NO contacts for release circuit

## Notes

Line fault detection on start button:  
If a linefault is present on the start button before the power is applied to A1,A2, the output contacts will not switch on.  
A line fault across the On-button which occurred after activation of the relay, will be detected with the next activation and the output contacts will not close.

To guarantee the operating safety of the LG5944, the safety function has to be tested regularly (time period depending on the application). This has to be done in 2 steps. As first step the sensor must be operated to proof the function of the sensor. As second step the test button on the monitoring device has to be operated (the sensor must not be activated) to simulate a broken sensor wire. in both cases the safety function must operate, which results in de-energisation of the safety output relays K1, K2, switching off the LEDs (K1, K2), opening of the contacts (13/14, 23/24).

## Technical Data

### Input

<b>Nominal Voltage <math>U_N</math>:</b>	AC / DC 24 V
<b>Voltage range:</b>	DC 0.9 ... 1.2 $U_N$ / AC 0.8 ... 1.1 $U_N$
<b>Nominal consumption:</b>	DC approx. 1.6 W / AC approx. 3 VA
<b>Short-circuit protection:</b>	Internal with PTC / electr. current limit
<b>Oversupply protection:</b>	Internal VDR
<b>Max. permissible safety edge contact resistance</b>	
LG 5944/_0_:	200 $\Omega$

DC:	approx. 0,6 mA at $U_N$
AC:	approx. 0,8 mA at $U_N$

### Output

<b>Contacts:</b>	2 Schließer
<b>Operate delay typ. bei <math>U_N</math>:</b>	
Manual start:	20 ms
Automatic start when connecting the power supply:	300 ms
when enabled by the safety edge:	20 ms
<b>Release delay typ. bei <math>U_N</math>:</b>	
Disconnecting the supply:	80 ms
when activating the safety edge:	40 ms
<b>Contact type:</b>	forcibly guided
<b>Nominal output voltage:</b>	AC 250 V
<b>Thermal current <math>I_{th}</math>:</b>	DC: see limit curve for arc-free operation max. 5 A

## Technical Data

### Switching capacity

to AC 15:	3 A / AC 230 V	IEC/EN 60 947-5-1
to DC 13:	2 A / DC 24 V	IEC/EN 60 947-5-1
to DC 13:	4 A / 24 V at 0.1 Hz	

### Electrical contact life

to AC 15 at 2 A, AC 230 V:	10 <sup>5</sup> switching cycles	IEC/EN 60 947-5-1
----------------------------	----------------------------------	-------------------

### Permissible operating frequency:

max. 1200 switching cycles / h		
--------------------------------	--	--

### Short circuit strength

max. fuse rating:	10 A gL	IEC/EN 60 947-5-1
line circuit breaker:	B 6 A	

### Mechanical life:

10 x 10 <sup>6</sup> switching cycles		
---------------------------------------	--	--

## General Data

### Operating mode:

Continuous operation

### Temperature range

operation:	- 15 ... + 55 °C
storage:	- 25 ... + 85 °C
altitude:	< 2.000 m

### Clearance and creepage distances

Rated impulse voltage / pollution degree:	4 kV / 2	IEC 60 664-1
EMC	IEC/EN 62 061	

### Interference suppression:

Limit value class B EN 55 011

### Degree of protection

Housing:	IP 40	IEC/EN 60 529
Terminals:	IP 20	IEC/EN 60 529

### Housing:

Thermoplastic with V0 behaviour according to UL subject 94	
Amplitude 0.35 mm IEC/EN 60 068-2-6 frequency 10 ... 55 Hz	IEC/EN 60 068-1 EN 50 005

### Climate resistance:

### Terminal designation:

Wire fixing:	Plus-minus terminal screws M 3.5
Mounting:	box terminals with wire protection or cage clamp terminals

Weight:	DIN rail	IEC/EN 60 715
	approx. 200 g	

## Dimensions

### Width x height x depth

LG 5944:	22.5 x 90 x 121 mm
LG 5944 PC:	22.5 x 111 x 121 mm
LG 5944 PS:	22.5 x 104 x 121 mm

## UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL60947, "general use applications"

### Standards:

- ANSI/UL 60947-1, 5<sup>th</sup> Edition (Low-Voltage Switchgear and Controlgear Part1: General rules)
- ANSI/UL 60947-5-1, 3<sup>rd</sup> Edition (Low-Voltage Switchgear and Controlgear Part5-1: Control circuit Devices an Switching Elements - Electro-mechanical Control Circuits Devices)
- CAN/CSA-C22.2 No. 60947-1-13, 2<sup>nd</sup> Edition (Low-Voltage Switchgear and Controlgear - Part1: General rules)
- CAN/CSA-C22.2 No. 60947-1-14, 1<sup>st</sup> Edition (Low-Voltage Switchgear and Controlgear - Part5-1: Control circuit Devices an Switching Elements - Electromechanical Control Circuits Devices)

### Switching capacity:

Pilot duty B300, Q300
8A 250Vac Resistive or G.P.
8A 24Vdc

### Wire connection:

min. 60°C copper conductors

Technical data that is not stated in the UL-Data, can be found in the technical data section.

## Standard Type

LG 5944.02PC/61	AC/DC 24 V
Article number:	0059038
• Output:	2 NO contacts
• Nominal voltage $U_N$ :	AC/DC 24 V
• Width:	22.5 mm

## Ordering Example

LG 5944 .02	/	/61	AC/DC 24 V
<p>Nominal voltage UL-approval Termination resistor of the safety edge in 2 wire connection 0 ... 1.2 kΩ 1 ... 8.2 kΩ Number of safety edges wire connection 0 device for 1 safety edge (2- and 4-wire connection possible) 1 device for 2 safety edges (only 2-wire connection possible) Type of terminals without indication: terminal blocks fixed with screw terminals PC (plug in cage clamp): pluggable terminal blocks with cage clamp terminals PS (plug in screw): pluggable terminal blocks with screw terminals Contacts Type</p>			

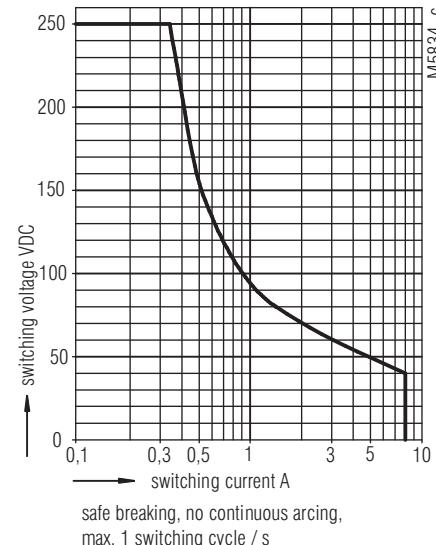

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	- Power supply not connected - Cross fault between S11 and S21
LED "K1" lights up, but "K2" remains off	- Safety relay K1 is welded (replace device) - A 1-channel switch-off occurred on S12 (switch channel off on S22)
LED "K2" lights up, but "K1" remains off	- Safety relay K2 is welded (replace device) - A 1-channel switch-off occurred on S22 (switch channel off on S12)
Device cannot be activated	Manual start mode: - Line fault on start-button (disconnect power supply and remove fault) Automatic start mode: - S33-S34 not bridged - A safety relay is welded (replace device) - Incorrect setting of switch S1

## Maintenance and repairs

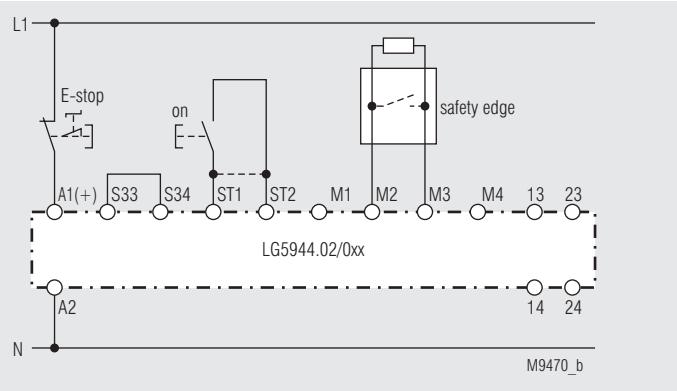

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristics

Arc limit curve under resistive load

## Application Examples

## Application example for /0xx

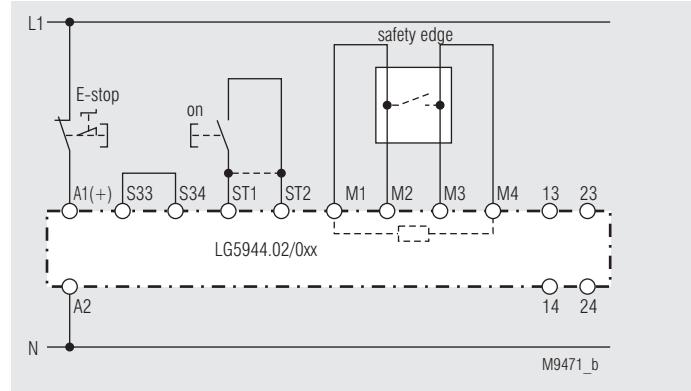

#### Safety device fore safety edges

Switches in pos.: S2: manual start

(for automatic restart S2 on autostart and ST1-ST2 bridged)

Connection: 2-wire circuit

Suited up to SIL3, Performance Level e, Cat. 3

## Application example for /0xx

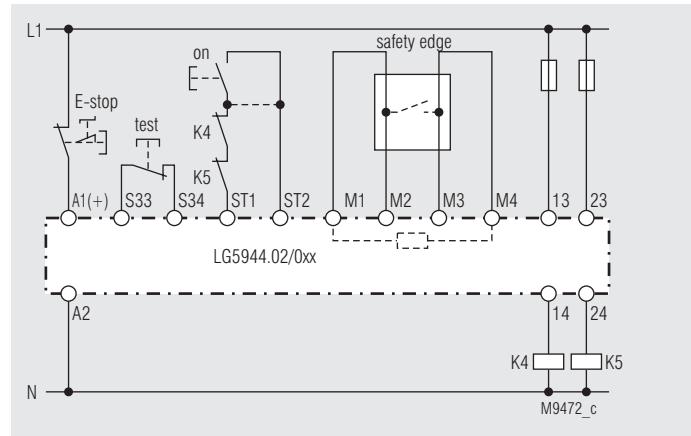

#### Safety device fore safety edges

Switches in pos.: S2: manual start

(for automatic restart S2 on autostart and ST1-ST2 bridged)

Connection: 4-wire circuit

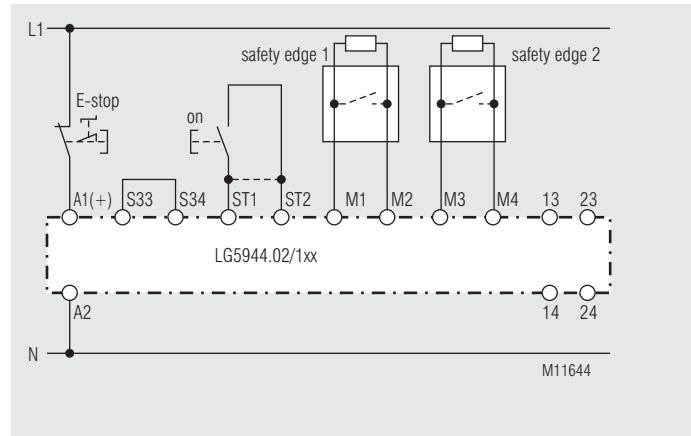

Suited up to SIL3, Performance Level e, Cat. 3

## Application example for /0xx

Contact multiplication by external contactors.

The function of the external contactors is monitored by connecting the NC contacts into the feedback circuit ST1-ST2 (for automatic restart S2 on autostart and instead of the ON button ST1-ST2 has to be bridged).

## Application example for /1xx

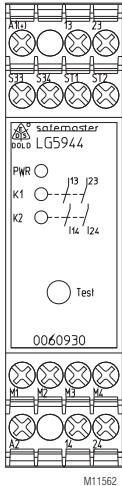

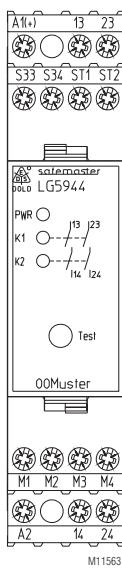

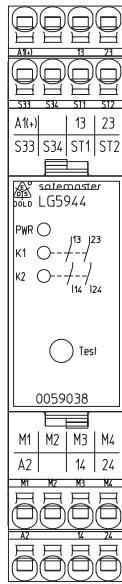

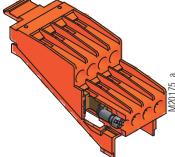

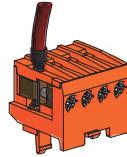

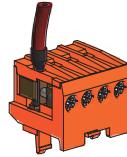

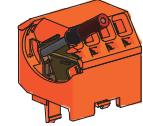

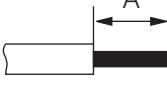

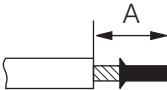

#### Safety device fore safety edges

Switches in pos.: S2: manual start

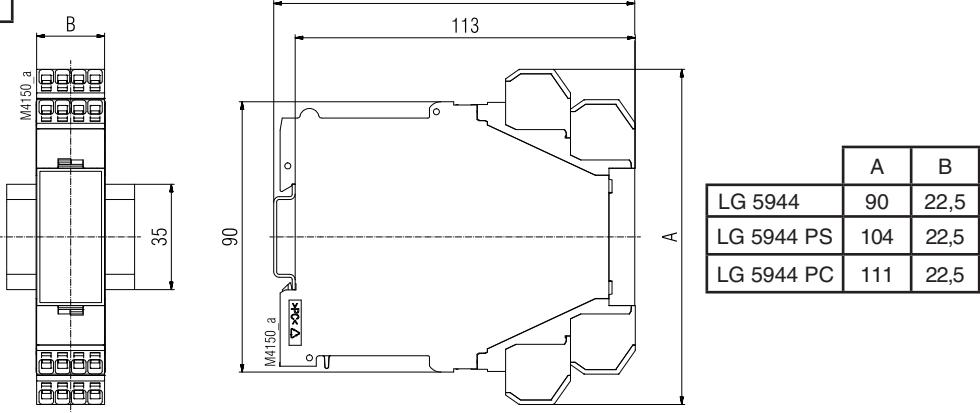

(for automatic restart S2 on autostart and ST1-ST2 bridged)  
If only 1 sensor is connected to one of the sensor inputs M1/M2, the

other sensor input M3/M4 has has to be bridged

HFT:	1	
DC / DC <sub>avg</sub> :	99,0	%
SFF	99,7	%
PFH <sub>D</sub> :	3,27E-10	h <sup>-1</sup>
T <sub>1</sub> :	20	a

<sup>1</sup> HFT = Hardware-Failure Tolerance

 The values stated above are valid for the standard type. Safety data for other variants are available on request.

The safety relevant data of the complete system has to be determined by the manufacturer of the system.

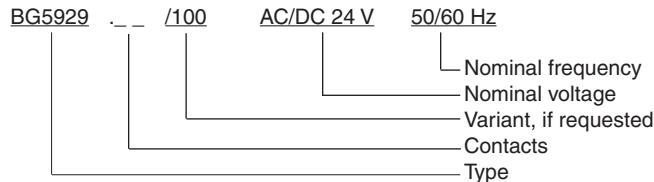

## Standard Type

BG 5929.60 AC/DC 24 V 50/60 Hz  
 Article number: 0050807  
 • Output: 5 NO contacts, 1 NC contact for feed back circuit  
 • Nominal voltage  $U_N$ : AC/DC 24 V  
 • Width: 22.5 mm

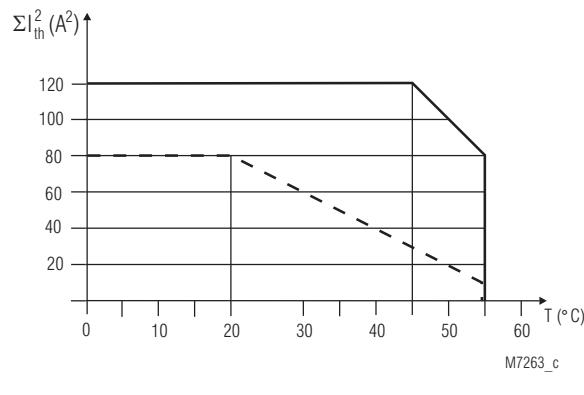

## Variants

BG 5929.\_\_\_\_/61: with UL-approval  
 BG 5929.\_\_\_\_/100: for 2-channel connection,  
 with 2 LEDs

## Ordering example for variants

## Characteristics

— AC / DC 24 V device mounted on distance with aircondition  
 - - - AC / DC 24 V device mounted without distances heated by devices with same load

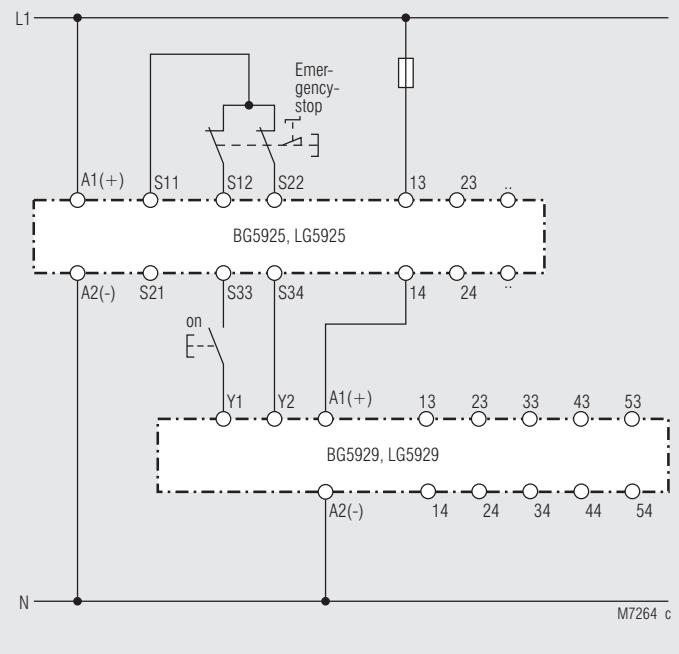

quadratic total current

$$\sum I_{th}^2 = I_{th1}^2 + I_{th2}^2 + I_{th3}^2 + I_{th4}^2 + I_{th5}^2$$

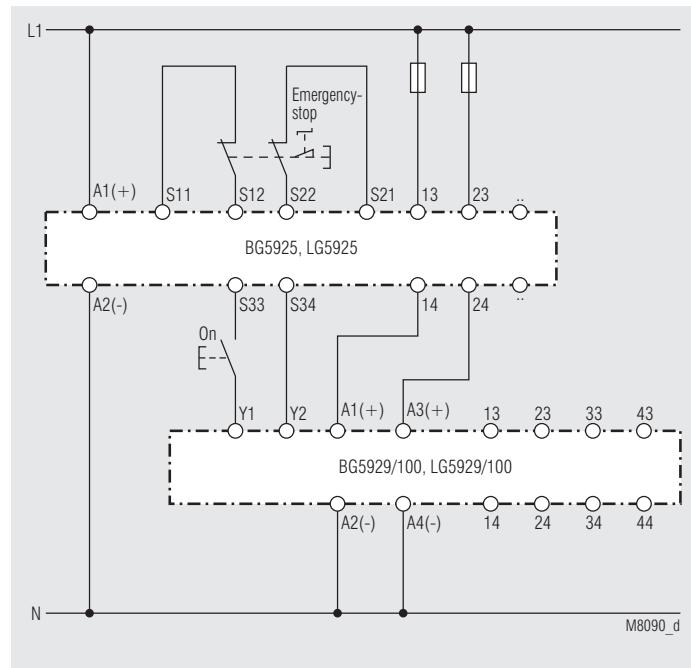

$I_{th1}$ ,  $I_{th2}$ ,  $I_{th3}$ ,  $I_{th4}$ ,  $I_{th5}$ : thermal current  $I_{th}$  on contact rows

Total current limit curve

## Application Examples

Contact multiplication with 2-channel e-stop and feedback circuit suited up to SIL3, Performance Level e, Cat. 4

Contact multiplication with BG 5929/100, suited up to SIL3, Performance Level e, Cat. 4

Before installing, operating or maintaining this device, these instructions must be carefully read and understood.

### DANGER

 **Dangerous voltage.**

**Electric shock will result in death or serious injury.**

 Disconnect all power supplies before servicing equipment.

### CAUTION

**Safe operation of the device is only guaranteed when using certified components!**

#### Important Notes

The product hereby described was developed to perform safety functions as a part of a whole installation or machine. A complete safety system normally includes sensors, evaluation units, signals and logical modules for safe disconnections. The manufacturer of the installation or machine is responsible for ensuring proper functioning of the whole system. DOLD cannot guarantee all the specifications of an installation or machine that was not designed by DOLD. The total concept of the control system into which the device is integrated must be validated by the user. DOLD also takes over no liability for recommendations which are given or implied in the following description. The following description implies no modification of the general DOLD terms of delivery, warranty or liability claims.

### Safety Regulations

- This device must be installed and operated by trained staff who are familiar with these instructions and with the current regulations for safety at work and accident prevention.
- Pay attention to applicable local regulations, especially regarding safety measures.
- The shock protection on the connected elements and the cable insulation must be designed for the highest voltage applied to the device.
- Opening the device or implementing unauthorized changes voids any warranty
- The unit should be panel mounted in an enclosure rated at IP 54 or superior. Dust and dampness may lead to malfunction.
- Adequate fuse protection must be provided on all output contacts with capacitive and inductive loads.
- The safety function must be triggered during commissioning.

### Designated use

The LG 5929 is designed to multiply the number of safety output contacts of safety modules and gate monitors.

When used in accordance with its intended purpose and following these operating instructions, this device presents no known residual risks. Non-observance may lead to personal injuries and damages to property.

### Main features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1: 2008
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508
  - when connected to a suitable safety module
- Control from semiconductor safety outputs (light curtains, e-stop, etc.) is also possible
- Redundant and forcibly guided contacts
- Output: max. 5 NO contacts or 4 NO contacts / 1 NC contact, 1 NC for feedback circuit
- 1- or 2-channel connection
- LED indication for operation
- Removable terminal strips
  - LG 5929: fixed screw terminals
  - LG 5929 PS: plug in screw terminals
  - LG 5929 PC: plug in cage clamp terminals

### Practical note

The extension module LG 5929 must only be used together with a safety unit e.g. LG 5925) that monitors the feedback circuit Y1/Y2 to achieve (SIL CL) 3 acc. to IEC/EN 62061, SIL 3 to IEC/EN 61508, Performance Level (PL) e and Category 4 to EN ISO 13849-1: 2008.

### Connection Terminals

Terminal designation	Signal designation
A1 (+), A3 (+)	+ / L
A2 (-), A4 (-)	- / N
13, 14, 23, 24, 33, 34, 43, 44, 53, 54	Forcibly guided NO contacts for release circuit
51,52	Forcibly guided indicator output
Y1,Y2	Forcibly guided feedback circuit

# Safety Technique

**SAFEMASTER**  
Extension Module  
UG 6929

**DOLD** 

0269007

## Product Description

If more safety circuits have to be switched, than a safety module provides, the extension module UG 6929 is used. It offers safe and reliable contact multiplication and re-enforcement for safety modules with monitoring of the feedback circuit. Safe semiconductor outputs can be extended by relay output contacts. The extension module has forcibly guided contacts and can be delivered with different contact arrangements.

## Your Advantage

- Safety contact multiplication

## Features

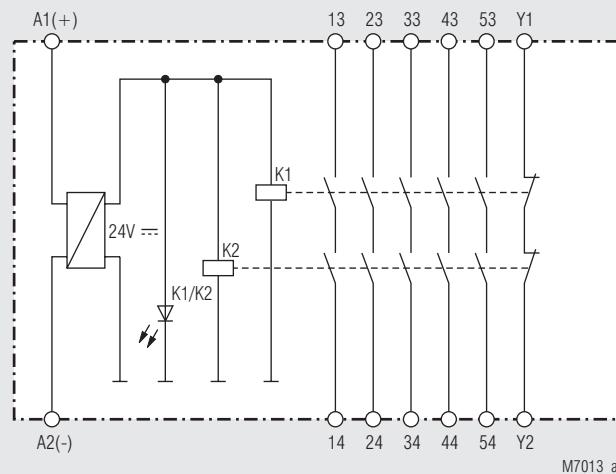

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508 and IEC/EN 61511 when connected to a suitable safety module
- According to EN 50156-1 for furnaces
- Control with safety semiconductor outputs (light curtain, e-stop) possible
- Redundant and forcibly guided contacts
- Output: max. 7 NO or 6 NO contacts / 1 NC contact, 1 NC contact for feedback circuit
- 1- or 2-channel
- Indication
- As option with pluggable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width: 22.5 mm

## Approvals and Markings

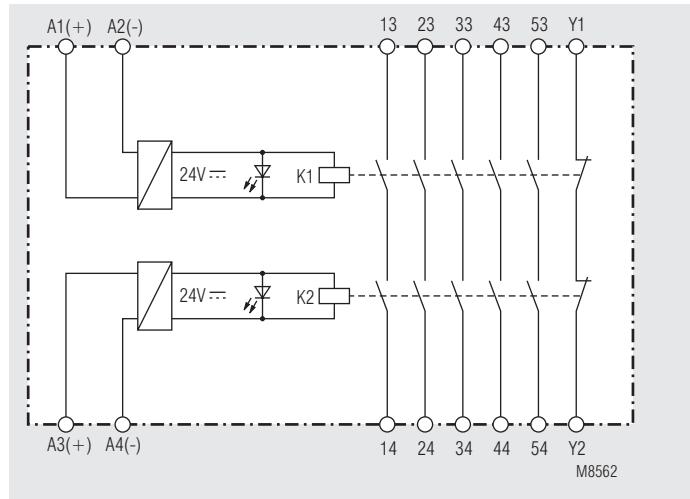

\* see variants

## Block Diagrams

UG 6929.60

UG 6929.60/100

## Application

For multiply the number of safety output contacts of safety modules and gate monitors.

## Indicators

### UG 6929

green LED K1/K2: on, when relay K1 and K2 energized

### UG 6929/100

green LED K1: on, when relay K1 energized  
green LED K2: on, when relay K2 energized

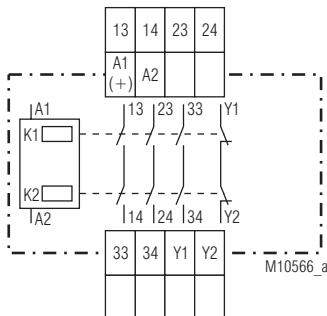

## Notes

The extension module UG 6929 must only be used together with a safety unit e.g. (UG 6970) that monitors the feedback circuit Y1/Y2 to achieve (SIL CL) 3 acc. to IEC/EN 62061, SIL 3 to IEC/EN 61508, Performance Level (PL) e and category 4 to EN ISO 13849-1: 2008.

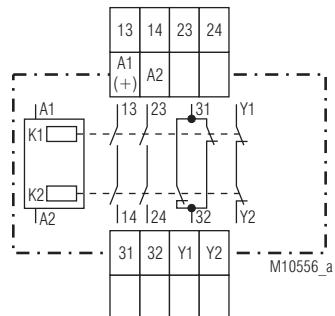

## Connection Terminals

### Standard Type

UG 6929.60PS/61 AC/DC24V

Article number: 0065304

• Output: 5 NO contacts,

1 NC contact for feedback circuit

• Nominal voltage: AC/DC 24 V

22.5 mm

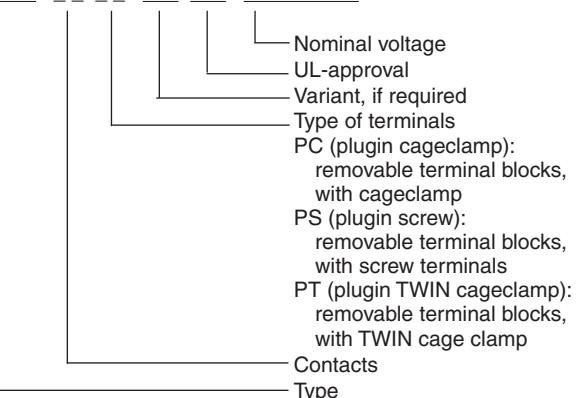

### Variant

UG 6929. \_\_ /100: for 2-channel with 2 LEDs

UG 6929. \_\_ /61: with UL approval

### Ordering example for variant

UG 6929. \_\_ /100 /61 AD/DC 24 V

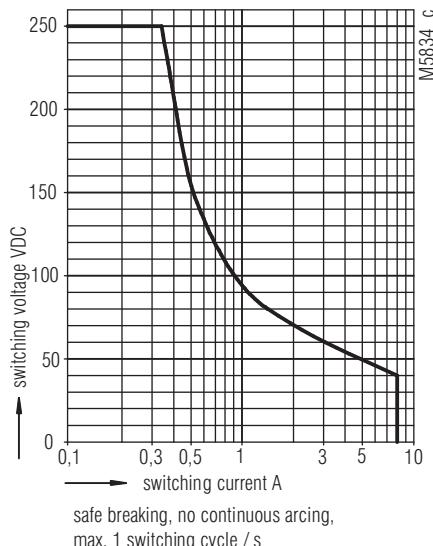

### Troubleshooting

Failure	Potential cause
LED "K1/K2" does not light up	Power supply not connected

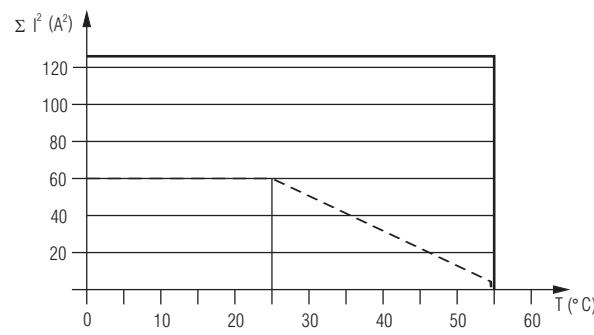

### Maintenance and Repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristics

Arc limit curve under resistive load

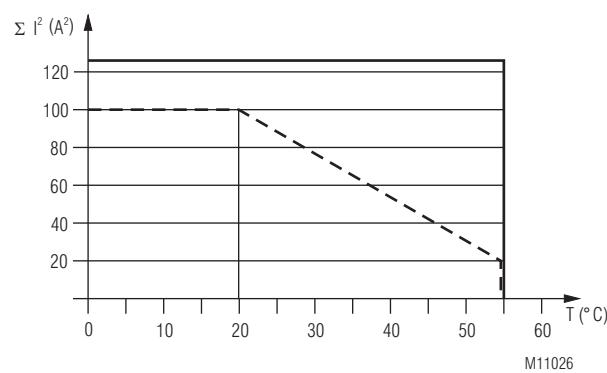

- AC 230V device mounted on distance with air circulation.  
max. current at 55°C over  
5 contact path = 5A  $\triangleq 5 \times 5^2 A^2 = 125 A^2$
  - - - AC 230V device mounted without distance heated by  
devices with same load,  
max current at 55°C over  
5 contact path = 1A  $\triangleq 5 \times 1^2 A^2 = 5 A^2$
- Quadratic total current

$$\sum I^2_{th} = I^2_{th1} + I^2_{th2} + I^2_{th3} + I^2_{th4} + I^2_{th5}$$

$I_{th1}, I_{th2}, I_{th3}, I_{th4}, I_{th5}$ : current in contact paths

Quadratic total current limit curve AC 230 V

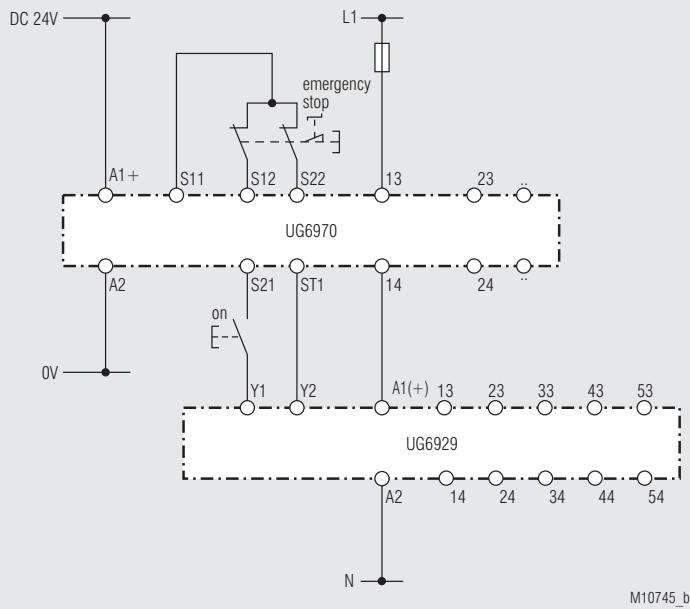

- AC / DC 24V device mounted on distance with air circulation.  
max. current at 55°C over  
5 contact path = 5A  $\triangleq 5 \times 5^2 A^2 = 125 A^2$
  - - - AC / DC 24V device mounted without distance heated by  
devices with same load,  
max current at 55°C over  
5 contact path = 2A  $\triangleq 5 \times 2^2 A^2 = 20 A^2$
- Quadratic total current

$$\sum I^2_{th} = I^2_{th1} + I^2_{th2} + I^2_{th3} + I^2_{th4} + I^2_{th5}$$

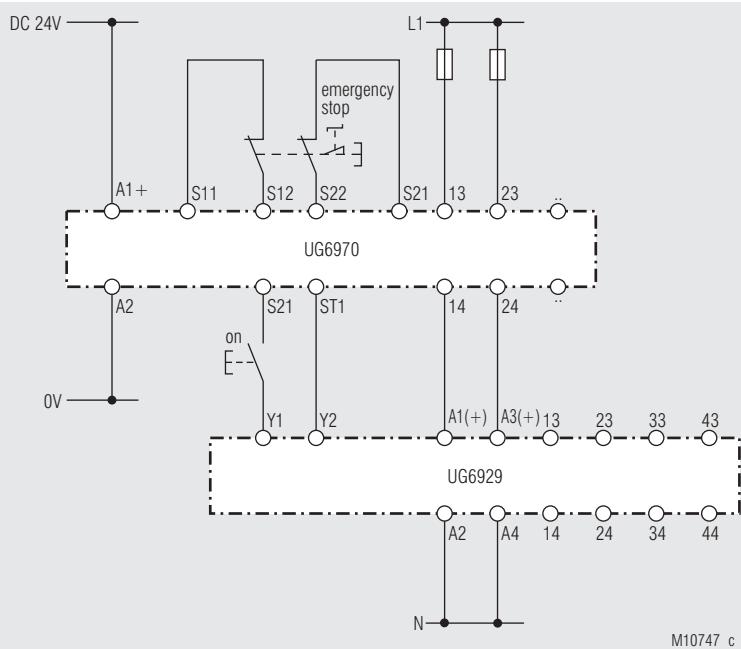

$I_{th1}, I_{th2}, I_{th3}, I_{th4}, I_{th5}$ : current in contact paths

Quadratic total current limit curve AC/DC 24 V

## Application Examples

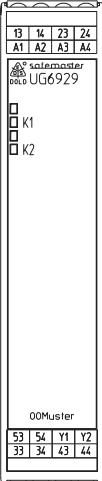

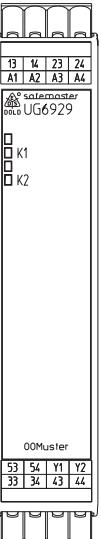

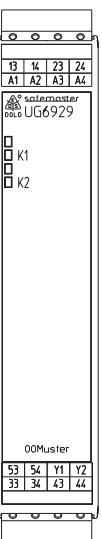

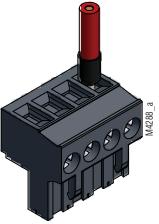

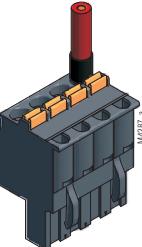

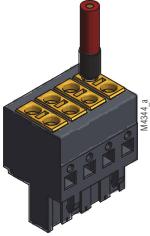

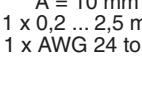

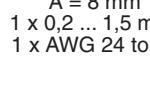

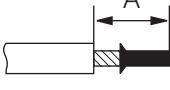

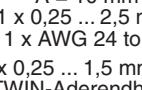

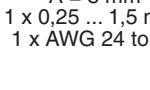

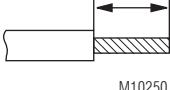

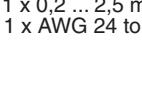

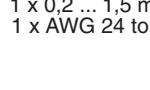

UG 6929; suited up to SIL3, Performance Level e, Cat. 4, if the extention module UG 6929 and the controlling safety module (e.g. UG 6970) are in the same cabinet.

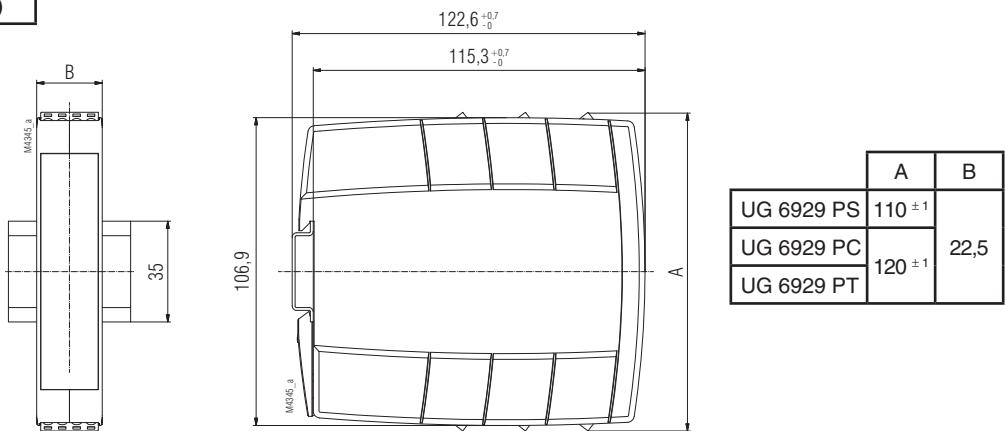

Contact extensions with UG6929/100; suited up to SIL3. Performance Level e. Cat. 4

## SAFEMASTER Expansion Module BN 3081

**DOLD** 

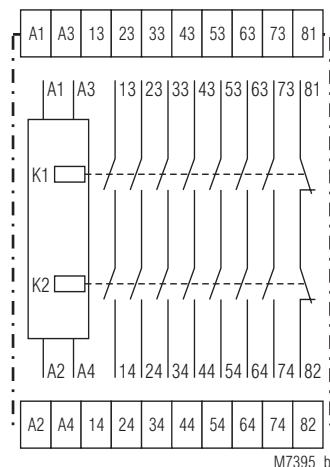

0221558

### Block Diagram

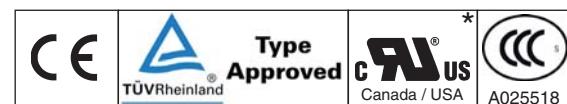

### Circuit Diagram

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1: 2008
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508 when connected to a suitable safety module
- Redundant and forcibly guided contacts
- Output: 7 NO contacts, 1 NC contact for feed back circuit
- 1- or 2-channel connection
- LED displays for channels 1.2
- Removable terminal strips
- Width 100 mm

### Approvals and Marking

### Applications

Contact multiplication of e-stop modules and safety door monitors.

### Indication

LED K1: on when supply on relay K1  
LED K2: on when supply on relay K2

### Notes

The extension module must only be used together with a safety unit (e.g. LG 5925) that monitors the feedback circuit 81/82 to achieve (SIL CL) 3 acc. to IEC/EN 62061, SIL 3 to IEC/EN 61508, Performance Level (PL) e, Category 4 to EN ISO 13849-1: 2008.

### Connection Terminals

Terminal designation	Signal designation

Terminals:	IP 20	IEC/EN 60 529
<b>Housing:</b>	Thermoplastic with V0 behavior according to UL subject 94	
<b>Vibration resistance:</b>	Amplitude 0.35 mm frequency 10 ... 55 Hz, IEC/EN 60 068-2-6	

## UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL 508, "general use applications"

### Switching capacity:

NO contact: Pilot duty B300  
10A 250Vac G.P.  
10A 24Vdc

NC contact: 10A 250Vac G.P.  
10A 24Vdc

Wire connection: Only for 60°C / 75°C copper conductors  
AWG 16 - 14 Torque 0.8 Nm

Technical data that is not stated in the UL-Data, can be found in the technical data section.

## CCC-Daten

Thermal current  $I_{th}$ : See quadratic total current limit curve  
(max. 5 A in one contact path)

Technical data that is not stated in the CCC-Data, can be found in the technical data section.

## Standard Type

BN 3081.63 AC/DC 24 V

Article number: 0044207

- Output: 7 NO contacts, 1 NC contact for feed back circuit
- Nominal voltage  $U_N$ : AC/DC 24 V
- Width: 100 mm

## Variant

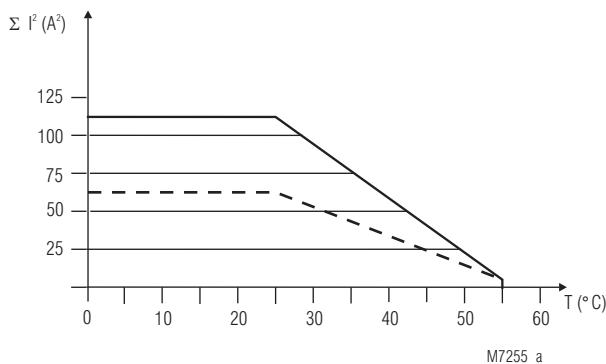

BN 3081.63/61: with UL-approval

### Ordering example for variant

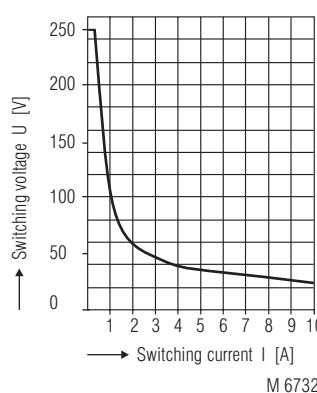

BN 3081.63 / AC 230 V 50/60 Hz

Nominal frequency  
Nominal voltage  
Variant, if required  
Contacts  
Type

## Characteristics

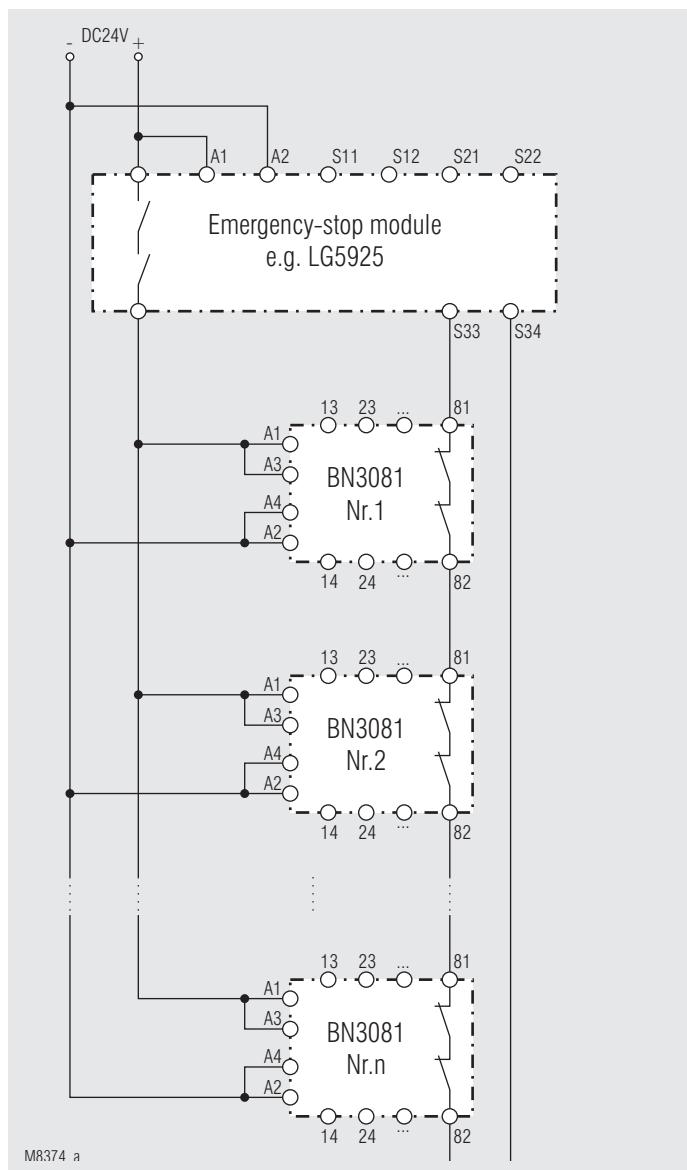

Quadratic total current limit curve

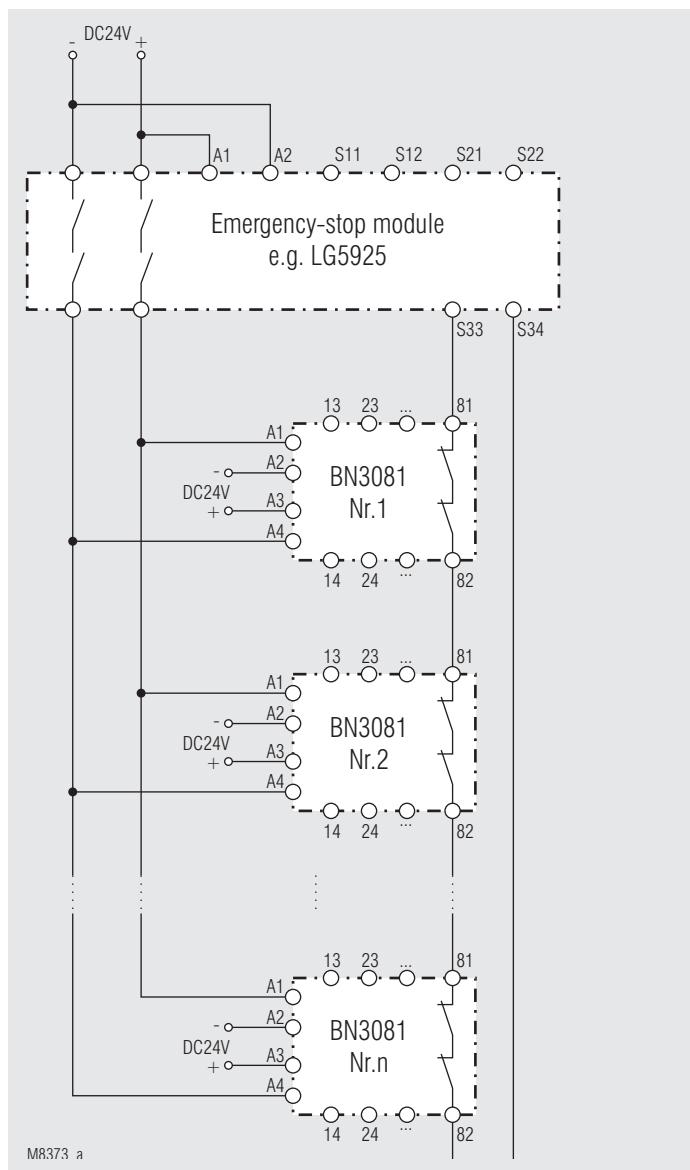

Limit curve for arc-free operation for resistive load

## Application Examples

Contact multiplication with several extension modules 1-channel;  
suitable up to SIL3, Performance Level e, Cat. 4

Contact multiplication with several extension modules 2-channel  
with cross fault monitoring;  
suitable up to SIL3, Performance Level e, Cat. 4

## SAFEMASTER

Delay module, release delay

BG 7925, BH 7925

**DOLD** 

0226827

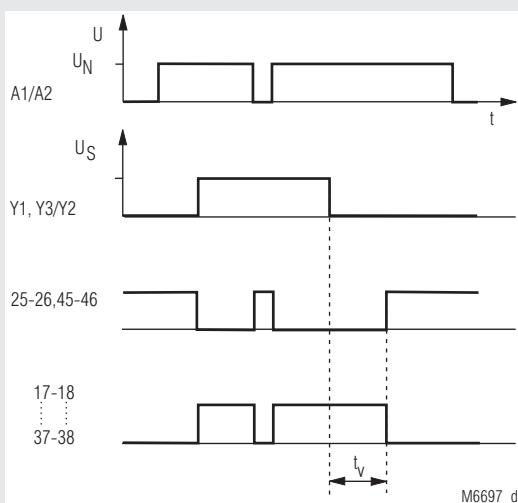

BG 7925

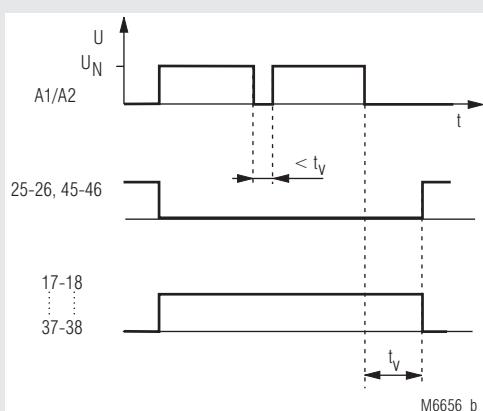

BH 7925

### Function Diagram for devices with auxiliary voltage

### Function Diagram for devices without auxiliary voltage

#### • According to

- Performance Level (PL d and category 2 to EN ISO 13849-1: 2008
- SIL Claimed Level (SIL CL 2 to IEC/EN 62061
- Safety Integrity Level (SIL 2) to IEC/EN 61508
- Category 2 nach EN 954-1

#### • Variants / \_2 to / \_3

- Performance Level (PL d and category 3 to EN ISO 13849-1: 2008
- SIL Claimed Level (SIL CL 2 to IEC/EN 62061
- Safety Integrity Level (SIL 2) to IEC/EN 61508
- Category 3 to EN 954-1

#### • Adjustable time delay

- Long time stability by digital timing circuit
- With auxiliary voltage

#### • 1 timing circuit

- BH 7925 in dual voltage version

- BH 7925 optionally for AC 230 V

- Output: 1 NC contact, 1 NO contact, forcibly guided or  
1 NC contact, 3 NO contacts, forcibly guided

#### • Indication of state of operation

- Removable terminal strips

- Wire connection: also  $2 \times 1.5 \text{ mm}^2$  stranded ferruled (isolated),  
 $2 \times 2.5 \text{ mm}^2$  stranded ferruled DIN 46 228-1/-2/-3/-4

- Optionally with 2 timing circuits

- Optionally fixed time delay

- Optionally without auxiliary voltage on BH 7925

- Optionally for switching small loads

- BG 7925: width 22.5 mm  
BH 7925: width 45 mm

### Approvals and Markings

\* see variants      <sup>1)</sup> only for BH 7925

### Application

Delayed switch-off in safety-control circuits, stop-category 1 according to IEC/EN 60 204-1

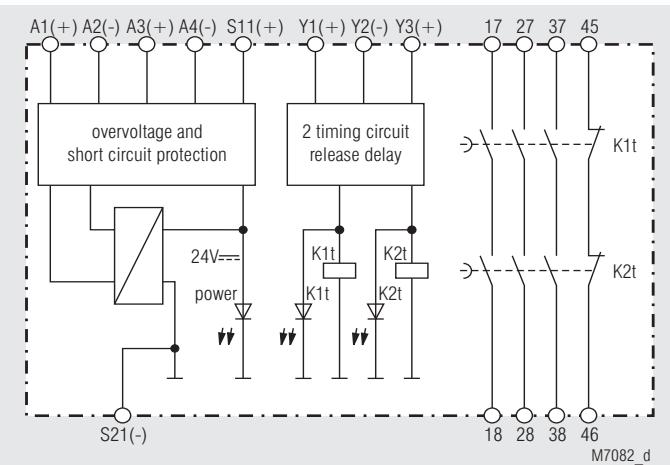

### Indication

LED "Power": on, when operating voltage applied

LED K1t: on, when output relay K1t activated

LED K2t: on, when output relay K2t activated

### Block Diagram

Block diagram for units with 2 timing circuits.  
In units with only 1 circuit K2t is missing.

## Notes

The output contacts of the two timing circuits are connected in series. This results in so-called switch off redundancy, i.e. the contact path is opened reliably after expiry of the predefined delay time, even if a contact in this path is welded.

AC-models can be connected to DC 24 V via terminals A3-A4.

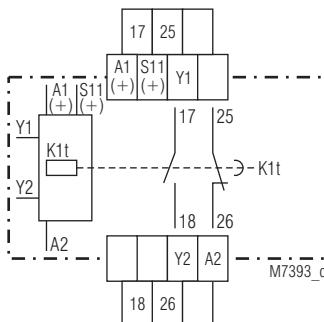

For units with auxiliary supply the control of the time circuits is made via terminals Y1, Y3/Y2 (see application examples). Plus is connected to Y1, Y3 and minus to Y2. Units without auxiliary supply are controlled with the nominal voltage  $U_N$ .

## Attention!

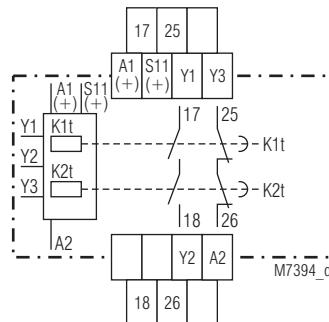

Before activating the unit it has to be checked by monitoring the NC contacts 45, 46, if both relays have been de-energized.

The gold plated contacts of the BG 7925.21/40\_ mean that this module is also suitable for switching small loads of 1 mVA - 7 VA, 1 mW - 7 W in the range 0.1 - 60 V, 1 - 300 mA. The contacts also permit the maximum switching current. However since the gold plating will be burnt off at this current level, the device is no longer suitable for switching small loads after this.

BG 7925 modules require auxiliary voltage. BH 7925 modules are available with or without auxiliary voltage.

The devices with gold plated contacts are suitable for switching small loads.

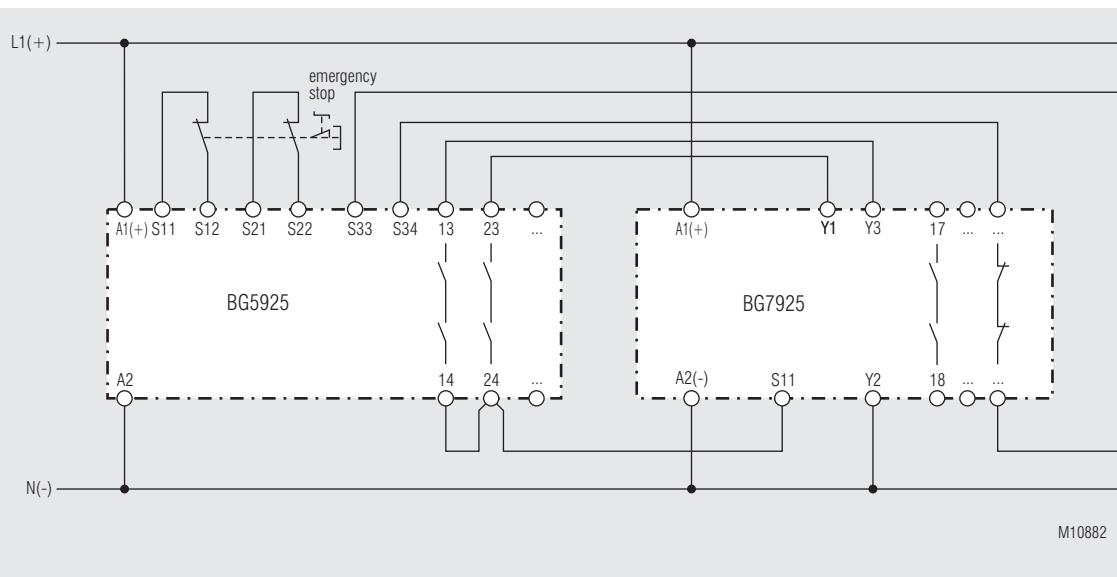

## Ordering example for Variants

## Application Examples

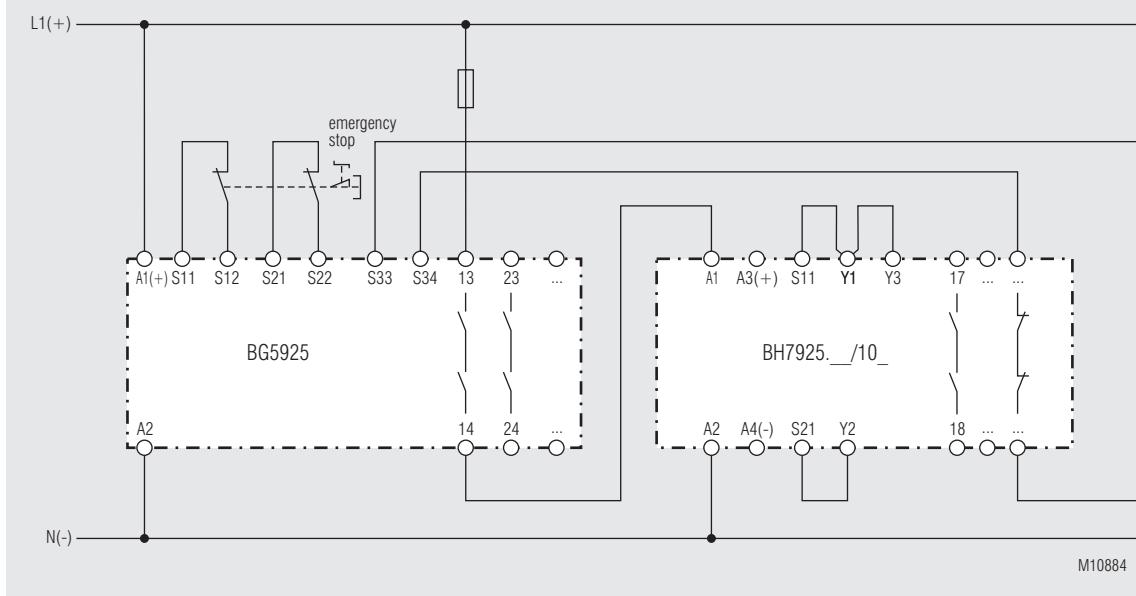

Versions with auxiliary voltage. Time control with internal voltage  $S11(+)$ ,  $S21(-)$ . Suited up to SIL2 Performance Level d, Cat. 3

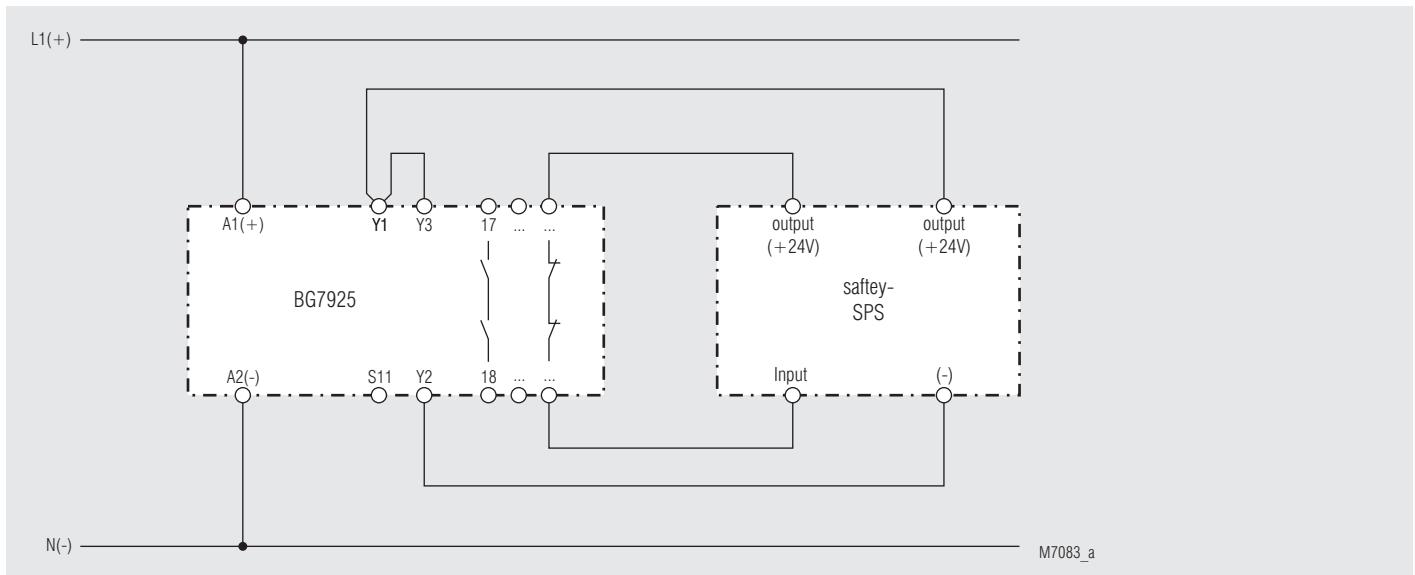

Versions with auxiliary voltage. Separate control of 2 timing circuits with internal voltage  $S11 (+)$ . Suited up to SIL2 Performance Level d, Cat. 3

## Application Examples

Versions without auxiliary voltage. Control of timing circuits over K1. Suited up to SIL2 Performance Level d, Cat. 3

Time control with external voltage (e.g. PLC). If voltage peaks  $\geq 500$  V are expected, they have to be limited by suitable means. Suited up to SIL2 Performance Level d, Cat. 3

## Block Diagrams

BG 7926.54

BG 7926.60

## Approvals and Markings

\* see variants

## Application

Delayed disconnection of safety relevant circuits, stop category 1 according to IEC/EN 60 204-1.

## Indicator

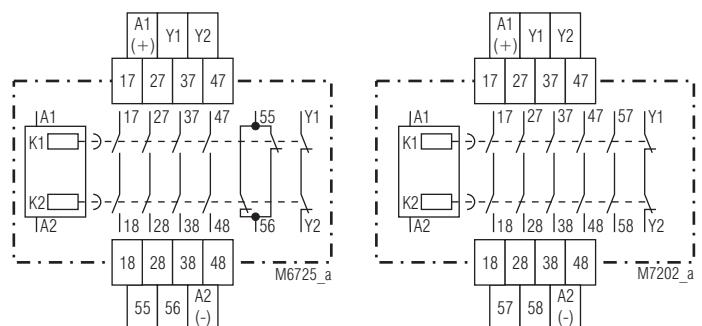

LED K1/K2: On, when control voltage applied

## Notes

### Attention!

 To achieve the safety levels stated under features, the supervising control (e.g. BG 5924) must check the NC contact Y1/Y2 before starting to make sure that both relays (K1 and K2) are switched off.

AWG 20 - 14 Str Torque 0.8 Nm

Technical data that is not stated in the UL-Data, can be found in the technical data section.

## Standard Type

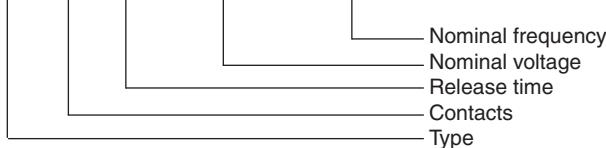

BG 7926.60 3 s AC/DC 24 V 50/60 Hz

Article number: 0050808

- Output: 5 NO contacts, 1 NC contact for feed back circuit
- Release time: 3 s
- Nominal voltage  $U_N$ : AC/DC 24 V
- Width: 22.5 mm

## Ordering Example

BG 7926 .60 3 s AC/DC 24 V 50 / 60 Hz

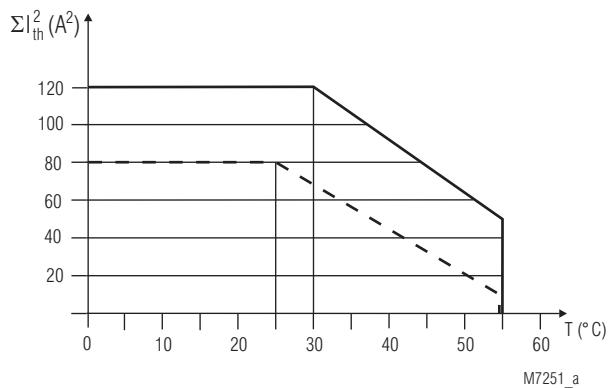

## Variant

BG 7926/61:

with UL-approval

## Characteristic

M7251\_a

— AC / DC 24 V device mounted on distance with aircondition

- - - AC / DC 24 V device mounted without distances heated by devices with same load

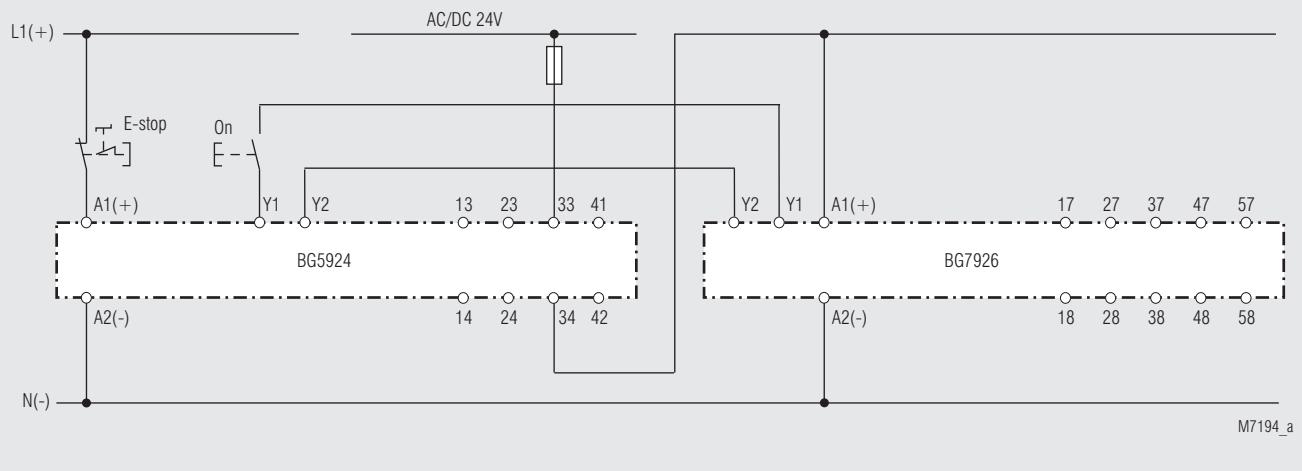

quadratic total current

$$\sum I_{th}^2 = I_{th1}^2 + I_{th2}^2 + I_{th3}^2 + I_{th4}^2 + I_{th5}^2$$

$I_{th1}, I_{th2}, I_{th3}, I_{th4}, I_{th5}$ : thermal current  $I_{th}$  on contact rows

Total current limit curve

## Application Example

M7194\_a

Multiplication of contacts at single channel E-stop circuit with feedback loop.

Suited up to SIL2, Performance Level d, Cat. 2

# Safety Technique

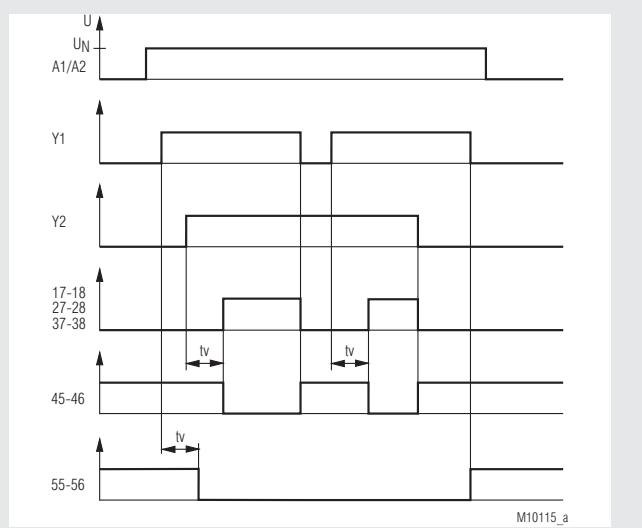

## SAFEMASTER Delay Module, On Delayed LG 7927

**DOLD** 

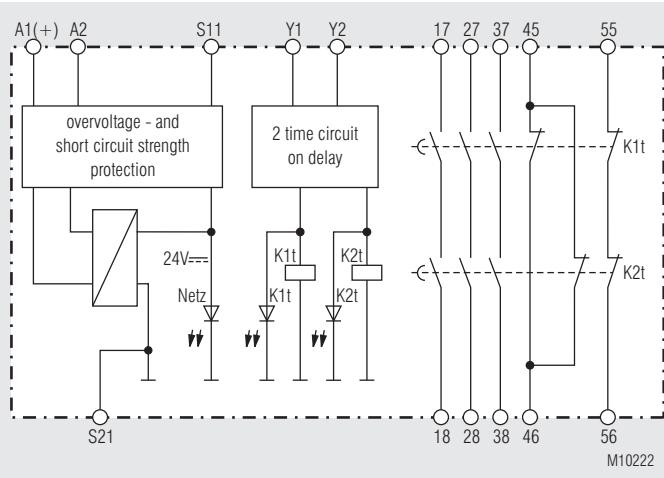

0261959

### Function Diagram

### Block Diagram

### Your advantage

- Easy to realise safe timing circuits
- 4 forcibly guided output contacts at only 22.5 mm width

### Features

- According to
  - Performance Level (PL) d and category 3 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 2 to IEC/EN 62061
  - Safety Integrity Level (SIL) 2 to IEC/EN 61508 and IEC/EN 61511 when connected to a suitable safety module
- Adjustable time delay
- As option fixed time delay
- High long life stability due to digital time base
- Adjustable with or without cross fault detection
- Output: 3 NO contacts + 1 NC contact + 1 forcibly guided feedback contact or 4 NO contacts + 1 forcibly guided feedback contact
- LED indicator for channel 1, 2 and operation voltage
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled, or 2 x 2.5 mm<sup>2</sup> solid DIN 46 228-1/-2/-3/-4
- As option with pluggable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width 22.5 mm

### Approvals and Markings

Canada / USA

A025518

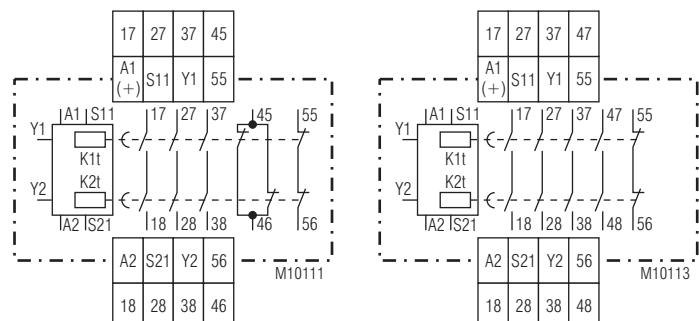

### Applications

- Delayed start or enabling of a movement.
- Delayed enabling of a solenoid lock, e.g. SAFEMASTER STS

### Indicators

upper LED: on, when supply connected  
lower LED: on, when relay K1t and K2t energized

### Circuit Diagrams

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	Power supply A1/A2 not connected
LED "K1t" lights up, but "K2t" remains off	- Signal on Y2 is not present - Wrong setting of operation mode (cross fault detection)
LED "K2t" lights up but "K1t" remains off	- Signal on Y1 is not present
Device cannot be activated	Safety relay is welded (replace device)

## Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristic

— AC/DC 24V device mounted on distance with air circulation.  
max. current at 55°C over  
4 contactrows =  $4A \triangleq 4 \times 4^2 A^2 = 64 A^2$

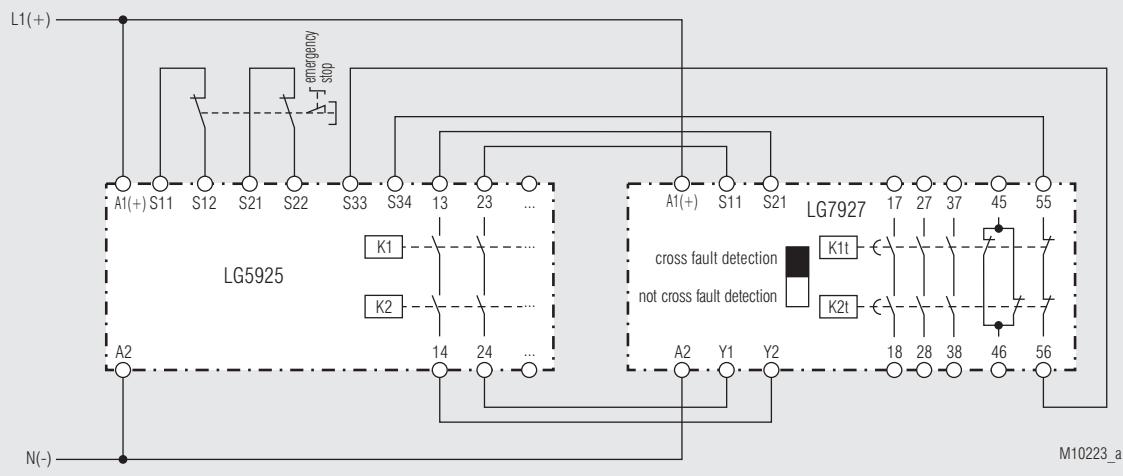

- - - AC/DC 24V device mounted without distance heated by  
devices with same load,  
max current at 55°C over  
4 contactrows =  $1,5A \triangleq 4 \times 1,5^2 A^2 = 9 A^2$

$$\Sigma I^2 = I_1^2 + I_2^2 + I_3^2 + I_4^2$$

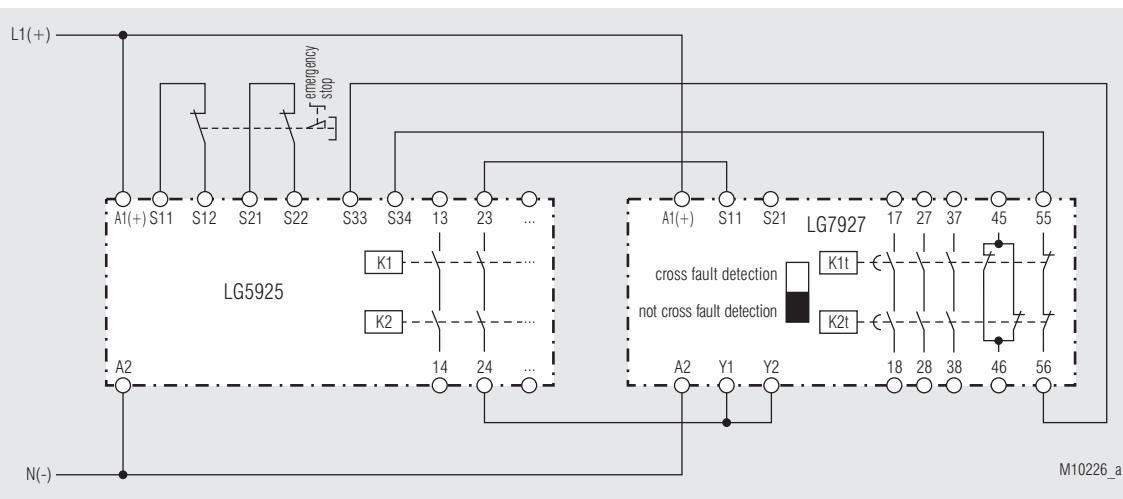

$I_1, I_2, I_3, I_4$  - current in contact paths

quadratic total current limit curve

## SAFEMASTER

### Delay Module, Release Delayed

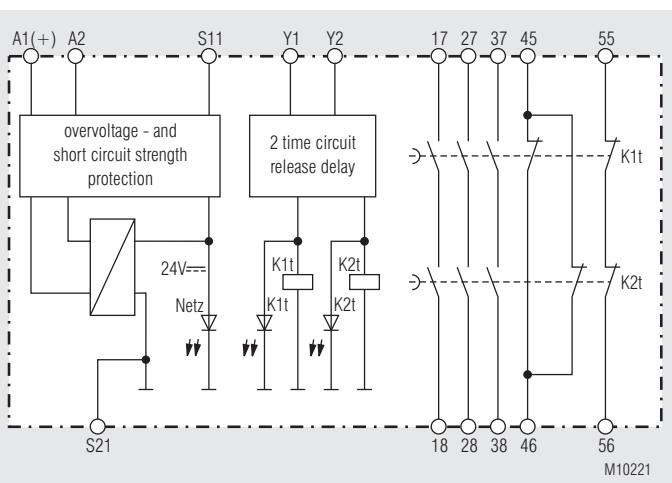

LG 7928

#### Function Diagram

#### Block Diagram

#### Your advantage

- Easy to realise safe timing circuits
- 4 forcibly guided output contacts at only 22.5 mm width

#### Features

- According to
  - Performance Level (PL) d and category 3 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 2 to IEC/EN 62061
  - Safety Integrity Level (SIL) 2 to IEC/EN 61508 and IEC/EN 61511 when connected to a suitable safety module
- Adjustable time delay
- As option fixed time delay
- High long life stability due to digital time base
- Adjustable with or without cross fault detection
- Output: 3 NO contacts + 1 NC contact + 1 forcibly guided feedback contact or 4 NO contacts + 1 NC contact + 1 forcibly guided feedback contact
- LED indicator for channel 1, 2 and operation voltage
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled, or 2 x 2.5 mm<sup>2</sup> solid DIN 46 228-1/-2/-3/-4
- As option with pluggable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width 22.5 mm

#### Approvals and Markings

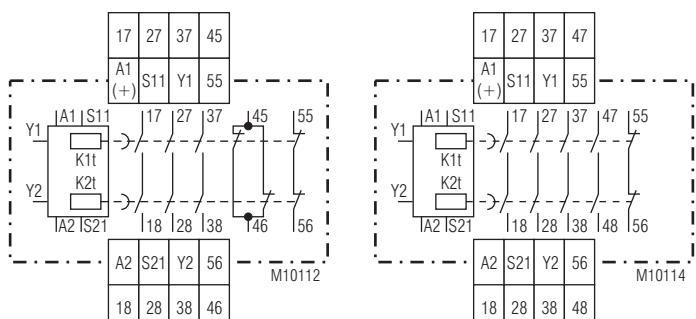

#### Applications

- Delayed disconnection with the possibility for status check of the safety relays, stop category 1 according to DIN EN 60204-1
- Controlled stop of system parts

#### Indicators

- upper LED: on, when supply connected  
lower LED: on, when relay K1t and K2t energized

#### Circuit Diagrams

LG 7928.97

LG 7928.98

#### Connection Terminals

### UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL 508, "general use applications"

**Nominal voltage  $U_N$ :** AC/DC 24 V

**Ambient temperature:** -15 ... +55°C

**Switching capacity:**

Ambient temperature 45°C: Pilot duty B300

5A 250Vac Resistive

5A 24Vdc Resistive or G.P.

Ambient temperature 55°C: Pilot duty B300

4A 250Vac Resistive

4A 24Vdc Resistive or G.P.

**Wire connection:**

Copper conductors only AWG 20 - 12 Sol/Str Torque 0.8 Nm

AWG 20 - 14 Sol Torque 0.8 Nm

AWG 20 - 16 Str Torque 0.8 Nm

Plug in cage clamp: AWG 20 - 12 Sol/Str

 Technical data that is not stated in the UL-Data, can be found in the technical data section.

### Standard Type

LG 7928.97/61 DC 24 V 1 ... 10 s

Article number: 0062795

• Output: 3 NO contacts, 2 NC contacts

• Nominal voltage  $U_N$ : DC 24 V

• Time delay  $t_v$ : 1 ... 10 s

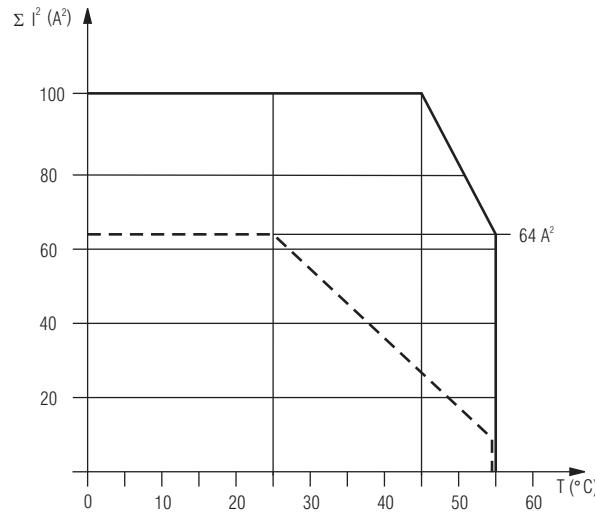

• Width: 22.5 mm

## Ordering Example

Type

## Characteristic

M10191

— AC/DC 24V device mounted on distance with air circulation.  
max. current at 55°C over  
4 contactrows = 4A  $\triangleq 4 \times 4^2 A^2 = 64 A^2$

- - - AC/DC 24V device mounted without distance heated by  
devices with same load,  
max current at 55°C over  
4 contactrows = 1,5A  $\triangleq 4 \times 1,5^2 A^2 = 9 A^2$

$$\sum I^2 = I_1^2 + I_2^2 + I_3^2 + I_4^2$$

$I_1, I_2, I_3, I_4$  - current in contact paths

quadratic total current limit curve

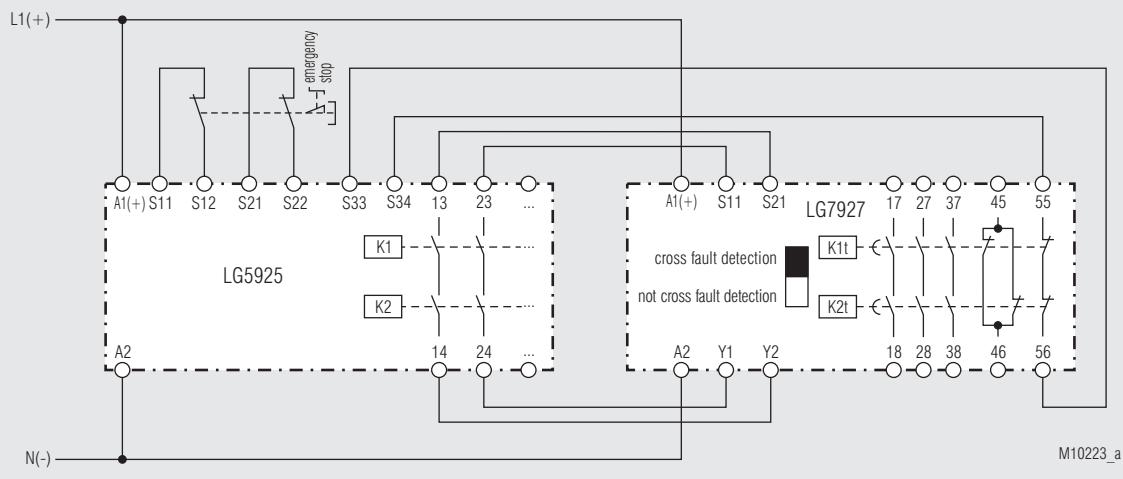

## Troubleshooting

Failure	Potential cause
LED "Power" does not light up	Power supply A1/A2 not connected
LED "K1t" lights up, but "K2t" remains off	- Signal on Y2 is not present - Wrong setting of operation mode (cross fault detection)
LED "K2t" lights up but "K1t" remains off	- Signal on Y1 is not present
Device cannot be activated	Safety relay is welded (replace device)

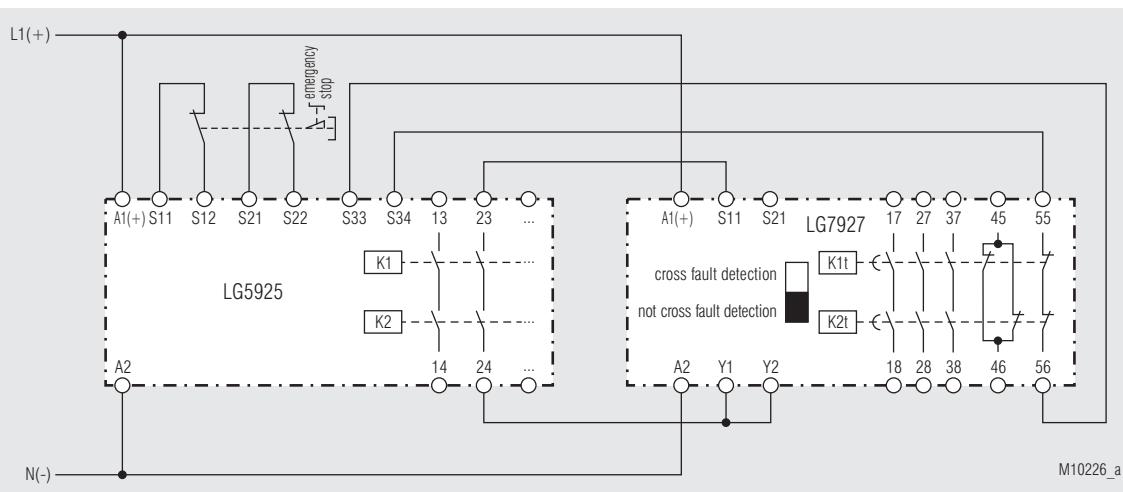

## Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

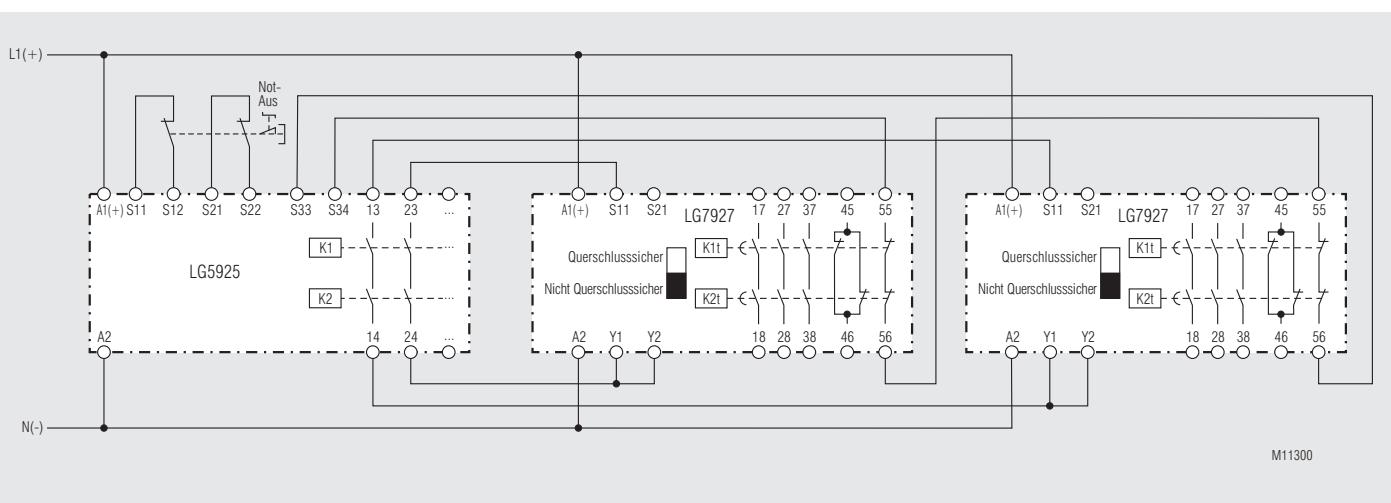

## Application Examples

LG 5925 with LG 7928, cross fault detection, suitable up to SIL2, Performance Level d, Cat. 3

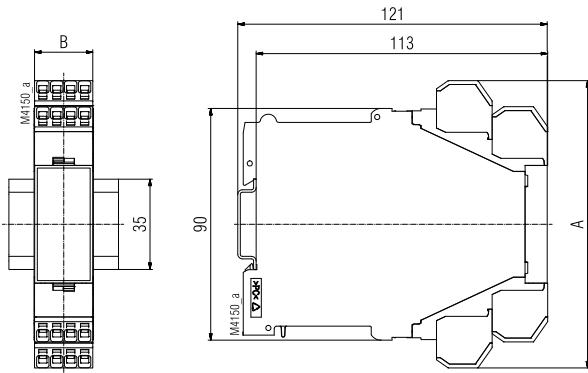

LG 5925 with LG 7928, non cross fault detection, suitable up to SIL2, Performance Level d, Cat. 3

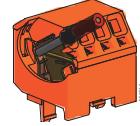

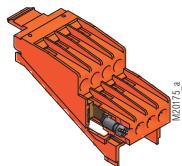

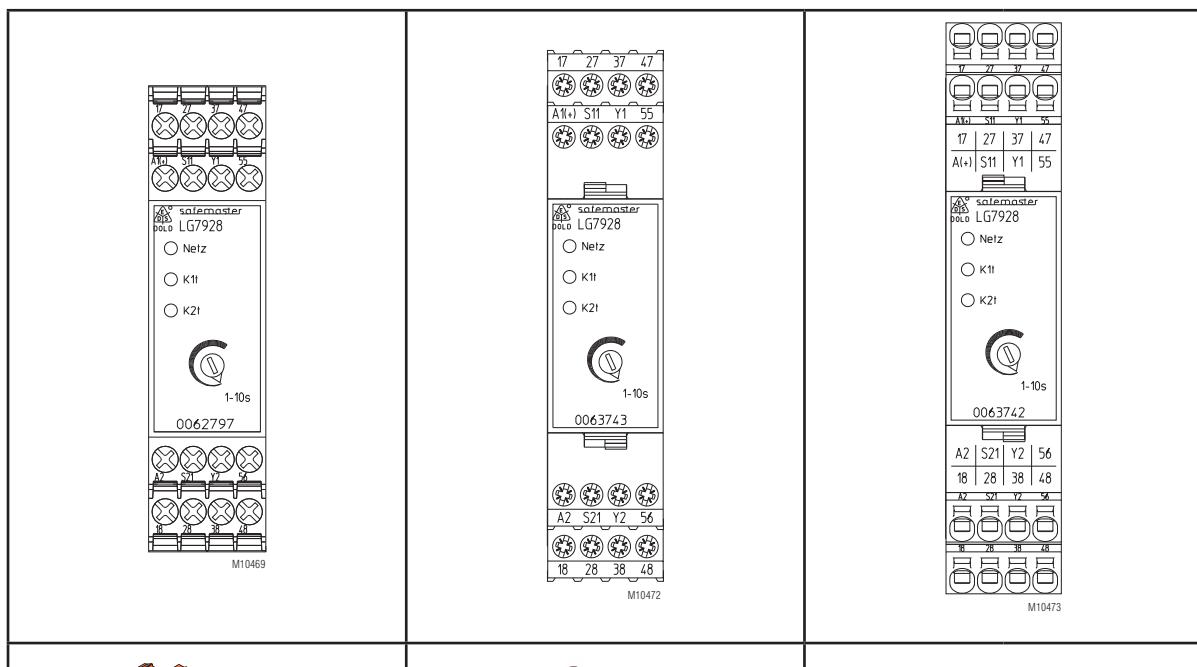

LG 5925 with two LG 7928, non cross fault detection, suitable up to SIL2, Performance Level d, Cat. 3

## SAFEMASTER

### Delay module, Release Delay

BA 7924, IL 7824, IN 7824

0221537

BA 7924.21

BA 7924.21/002

IL 7824.21

IN 7824.21

#### • According to

- Performance Level (PL) c and category 2 to EN ISO 13849-1
- SIL Claimed Level (SIL CL) 2 to IEC/EN 62061
- Safety Integrity Level (SIL) 2 to IEC/EN 61508
- Category 2 to EN 954-1

#### • BA 7924.21/002 und BA 7924.21/003

- Performance Level (PL) d and category 3 to EN ISO 13849-1
- SIL Claimed Level (SIL CL) 2 nach IEC/EN 62061
- Safety Integrity Level (SIL) 2 to IEC/EN 61508
- Category 3 to EN 954-1

#### • Release delay

- Without auxiliary voltage
- Output: 1 NC, 1 NO contacts, forcibly guided
- Operating state display
- Optionally with adjustable or fixed time delay up to 30 s
- Optionally with redundant timing circuit
- Optionally with 1 or 2 separate timing circuits
- Optionally also in housing for distribution board
- Width 45 mm, 35 mm or 52.5 mm

#### Approvals and Markings

\* see variants

#### Application

- Delayed disconnection with testable switching status of output relays.

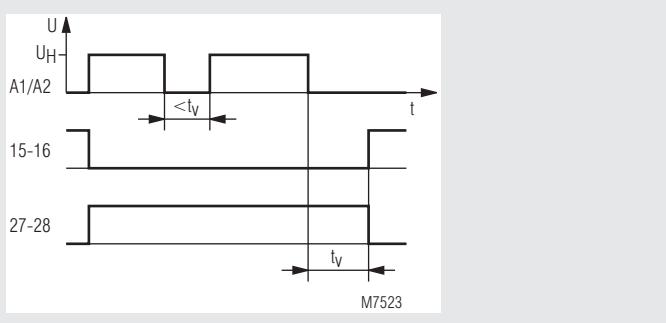

#### Indicators

LED's comes on when A1 / A2 connected to supply

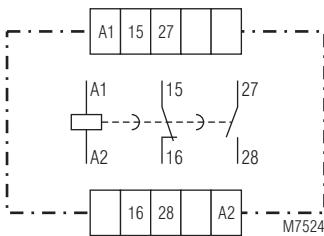

#### Notes

The output contacts of the two timing circuits are connected in series in the BA 7924.21/002 and /003 modules. This results in so-called switch-off redundancy, i.e. the contact path 27-28 is opened reliably after expiry of the predefined delay time, even if a contact in this path is welded.

IN 7824:	52.5 x 89 x 58 mm

## CCC-Data

### Nominal voltage $U_N$ :

BA 7924: DC 24 V, AC 230V

**Thermal current  $I_{th}$ :** max. 5 A

### Switching capacity

to AC 15

NO contact: 2 A / AC 230 V IEC/EN 60 947-5-1

to DC 13

NO contact: 1 A / DC 24 V IEC/EN 60 947-5-1

NC contact: 1 A / DC 24 V IEC/EN 60 947-5-1

 Technical data that is not stated in the CCC-Data, can be found in the technical data section.

### Standard Type

BA 7924.21 DC 24 V 0.3 ... 3 s

Article number: 0039707

• Output: 1 NO contact

1 NC contact

• Nominal voltage  $U_N$ : DC 24 V

• Time range: 0.3 ... 3 s

• Width: 45 mm

### Variants

BA 7924.21/61: with UL approval (Canada/USA)

BA 7924.21: 1 timing circuit, adjustable time

BA 7924.21/001: 1 timing circuit, fixed time

BA 7924.21/002: 2 timing circuit, fixed time

BA 7924.21/003: 2 timing circuit, adjustable time

Delay modules in housing for distribution board:

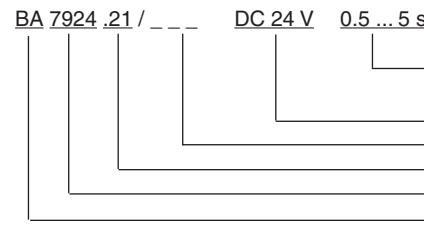

IL 7824.21: 1 timing circuit, adjustable time delay, 35 mm wide

IN 7824.21: 1 timing circuit, adjustable time delay, 55 mm wide

IL 7824.21/100: 1 timing circuit, fixed time delay, 35 mm wide

IN 7824.21/100: 1 timing circuit, fixed time delay, 55 mm wide

### Ordering example for variants

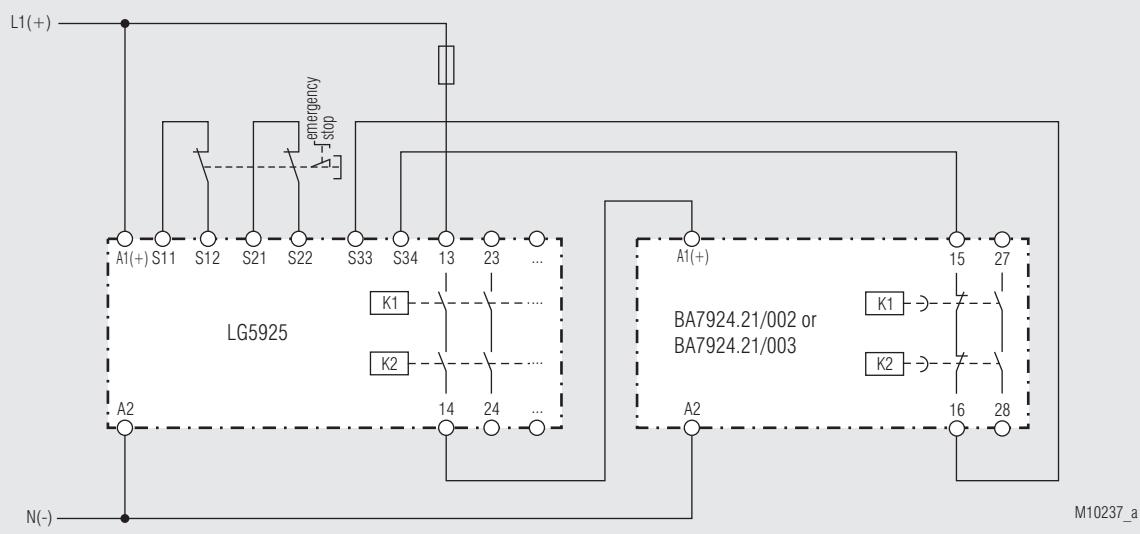

### Troubleshooting

Failure	Potential cause
Device cannot be activated	- Power supply not connected - Unit defective

### Maintenance and repairs

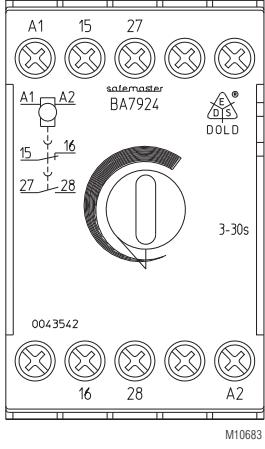

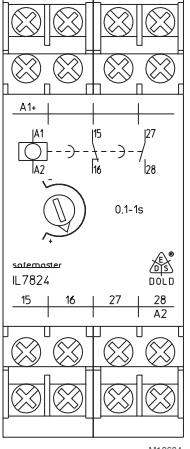

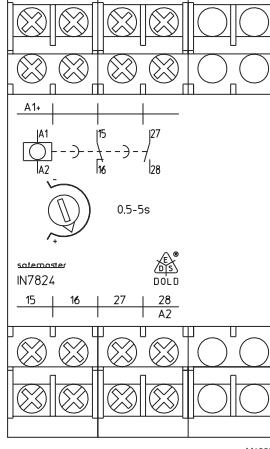

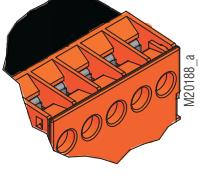

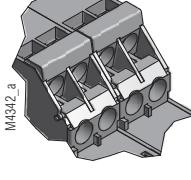

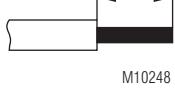

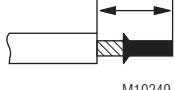

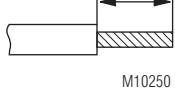

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Application Example

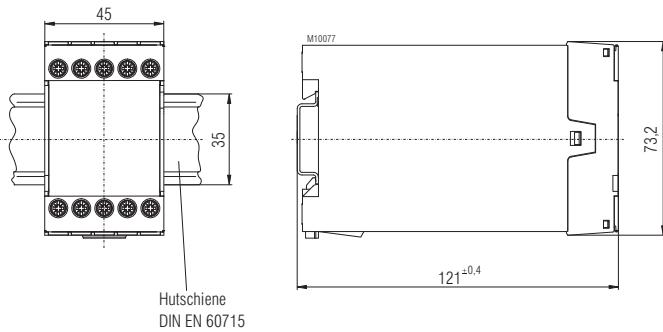

LG 5925 with BA 7924.21/002 e.g. BA 7924.21/003, suitable up to SIL 3, Performance Level e; Cat. 3

- According to DIN EN 61810
- With forcibly guided contacts according to IEC 61810-3
- Pluggable safety relay
- Low rated power consumption: 0.8 W
- Max. 2 output contacts
- Contact material: AgNi with fine gold
- High thermal current up to  $I_{th} = 5 \text{ A}$
- Large temperature range: - 40 ... + 85 °C
- As option with free-wheel diode or varistor between A1/A2
- As option with AgSnO<sub>2</sub> or AgNi with hard gold
- Width: 15.8 mm

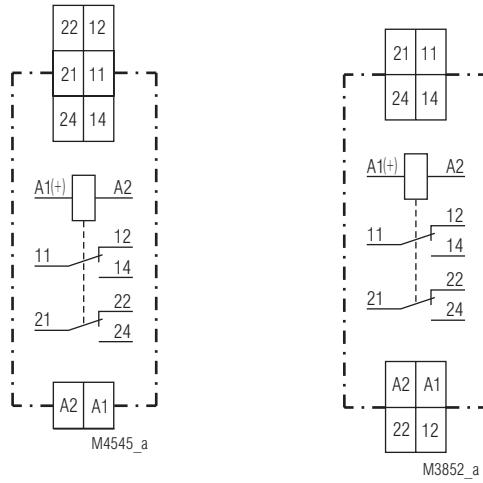

## Notes

Safety relay with forcibly guided contacts OA 5669 and socket for supporting DIN-rail mounting.

Article number: 0046578

## Characteristics

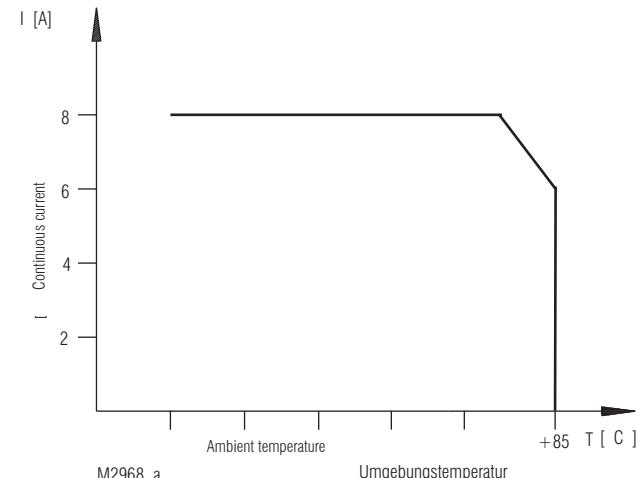

Safe switch-off, no continuous arc,  
max. 1 switching operation / s

Limit curve for arc-free operation under ohmic load

IK 3079: Continuous current limit curve as a function of the ambient temperature (only for not mounted devices)

IK 3079/103: Continuous current limit curve as a function of the ambient temperature (only for not mounted devices)

### Your Advantages

- Simple contact extension and re-inforcement also of safety modules
- Cost and space saving alternative compared to contactors
- Simple contact monitoring via forcibly guided NC contact
- Large wire cross section 0.5 - 2.5 mm<sup>2</sup> (12-24 AWG) reduces thermal load on wires

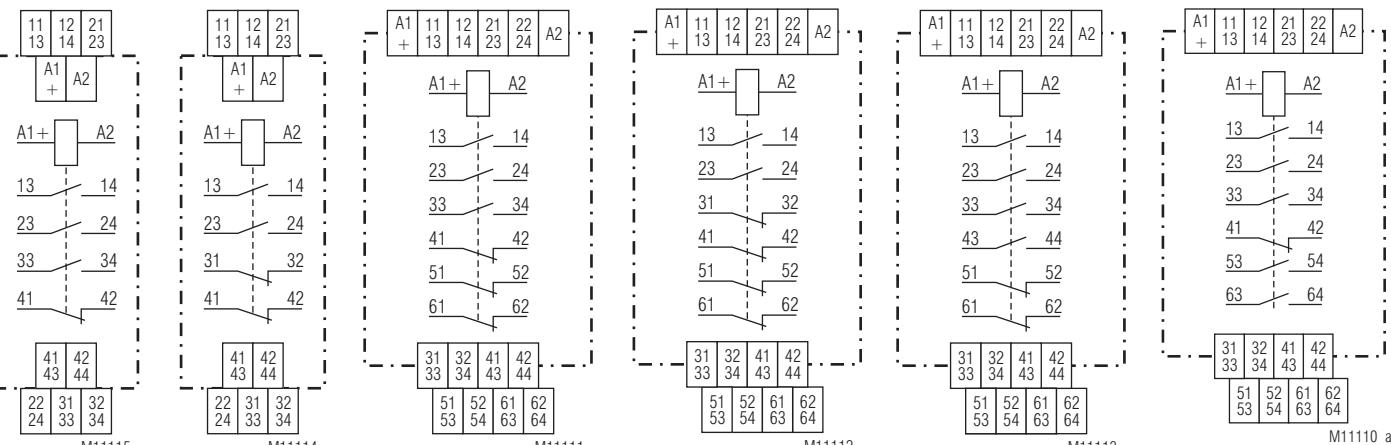

### Features

- According to DIN EN 61810-1, IEC 60664-1, IEC/EN 60 947-5-1
- With forcibly guided contacts according to IEC 61810-3
- Models with soldered in or plug-in PCB safety relay consisting of:  
- plug in socket HC 3096N and safety relay OA 5611  
- plug in socket HL 3096N and safety relay OA 5612
- With polarity protected diode
- Optionally with free-wheeling diode across A1+ and A2
- Optionally AgNi + 0,2 µm Au or AgNi + 5 µm Au
- For DIN rail mounting according IEC/EN 60715
- HC 3096N: width 18 mm

Arc limit curve under resistive load

Contact service life

## Connection example for HC 3096N/10\_61

**Relay: OA 5611.52  $\hat{=}$  2 NO contacts and 2 NC contacts (Standard)**

Contact	Contact-type	Connection
1	NO contact	13, 14
2	NO contact	23, 24
3	NC contact	31, 32
4	NC contact	41, 42

The terminal assignment is according to the diagram on the installed relay

## Connection example for HC 3096N/10\_61

**Relay: OA 5612.18  $\hat{=}$  3 NO contacts and 3 NC contacts (Standard)**

Contact	Contact-type	Connection
1	NO contact	13, 14
2	NO contact	23, 24
3	NO contact	33, 34
4	NC contact	41, 42
5	NC contact	51, 52
6	NC contact	61, 62

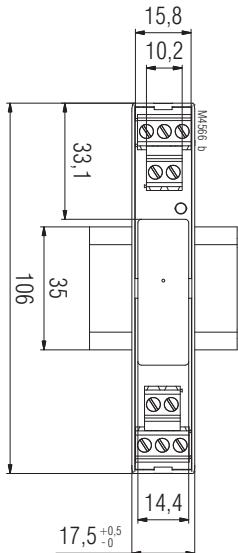

The terminal assignment is according to the diagram on the installed relay

## Safety Notes

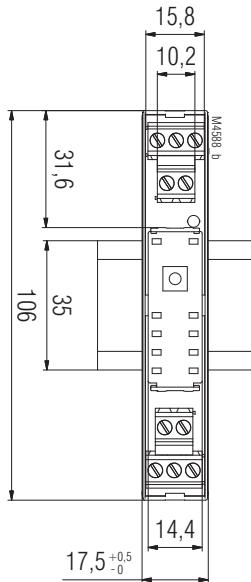

- Faults must only be removed when the relay is disconnected
- The user has to make sure that the device and corresponding components are installed and wired according to the local rules and law (TUEV, VDE, Health and safety).
- Installation work must only be done when power is disconnected.

## Options with Pluggable Terminal Blocks

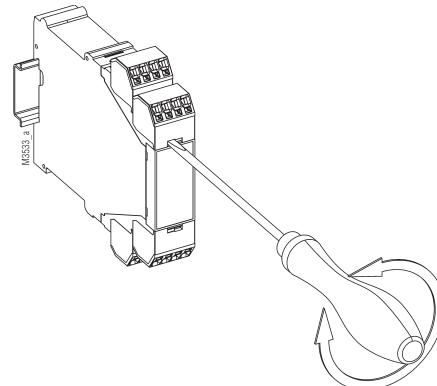

Screw terminal (PS/plugin screw) Cage clamp terminal (PC/plugin cage clamp)

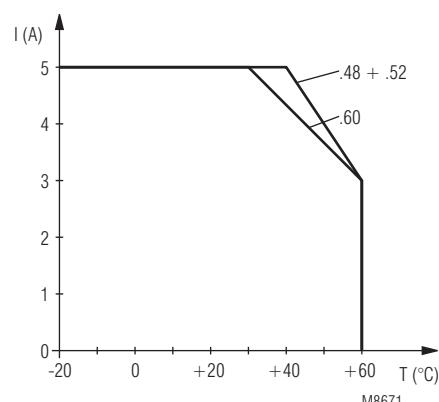

## Notes

Removing the terminal blocks with cage clamp terminals

1. The unit has to be disconnected.
2. Insert a screwdriver in the side recess of the front plate.
3. Turn the screwdriver to the right and left.
4. Please note that the terminal blocks have to be mounted on the belonging plug in terminations.

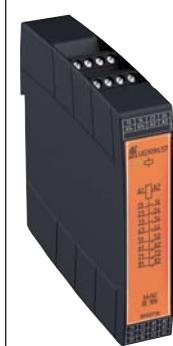

## Characteristic

## Interface Module UG 3096, UH 3096

**DOLD** 

0266468

UG 3096

UH 3096

### Your Advantages

- According to IEC/EN 60 947-5-1
- Simple contact multiplication and reinforcement also for safety modules
- Cost and space saving alternative compared to contactors
- Easy monitoring of contact state via forcibly guided NC contacts

### Features

- With **forcibly guided** contacts according to IEC 61810-3
- UG 3096: 8 output contacts  
UH 3096: 16 output contacts
- As option with gold plated contacts to switch low loads
- As option with contacts connected in series to switch high DC-loads
- As option with pluggable terminal block for easy exchange of devices
  - with screw terminals
- UG 3096: Width 22.5 mm  
UH 3096: Width 45 mm

### Approvals and Markings

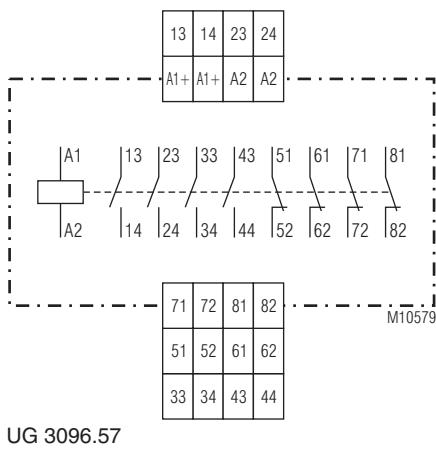

### Applications

- Interfacing between control and load circuits
- Contact multiplication and reinforcement
- separate switching of several current circuits, e. g. with
  - Machines and plants,
  - Energy production and transport

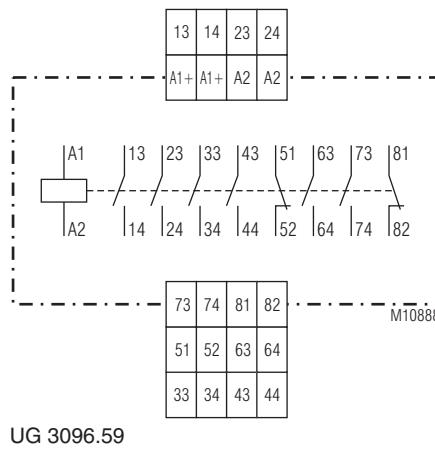

### Indicator

green LED: on, when supply connected

## Product Description

The interface module UG3088 includes 2 separate devices in one enclosure. Because of its forcibly guided contacts a safe interfacing between control circuit and load circuit is provided. It can also be used to multiply and reinforce the contacts of safety modules. Different internal configuration possibilities allow to offer interface modules for various applications. To switch e.g. high DC loads the the output contacts can be connected in series. On the module with 2NO and 2 NC contacts these can be connected internally as changeover contacts. Also a common control of both relays with only one input can be done.

## Your Advantages

- According to IEC/EN 60 947-5-1
- Economic and space saving because of 2 separate interface modules in one enclosure
- Simple contact multiplication and reinforcement - also of safety modules
- Cost and space saving alternative compared to contactors
- Simple contact monitoring by forcibly guided contacts
- With pluggable terminal blocks for easy exchange of devices

## Features

- With forcibly guided contacts according to IEC 61810-3
- Version with up to 2 x 4 contacts
- Variant to switch high DC-load
- Width: 22,5 mm

## Approvals and Markings

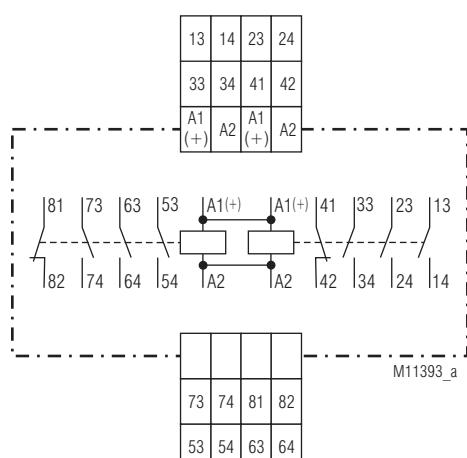

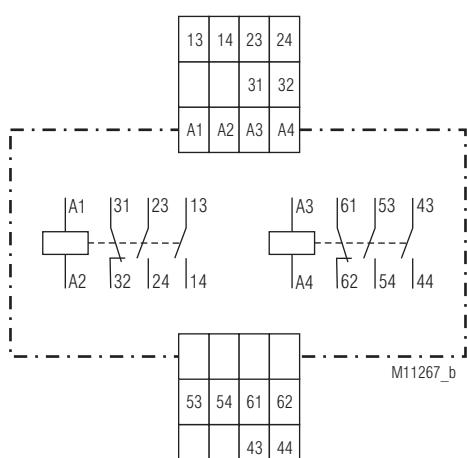

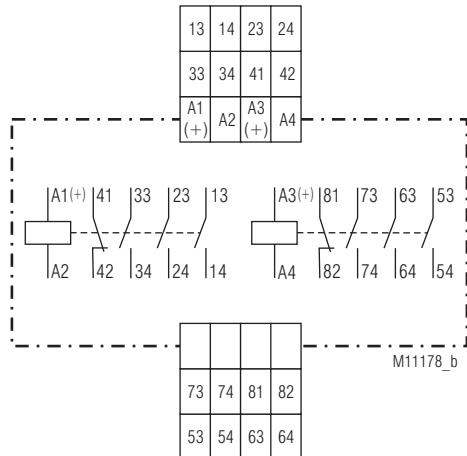

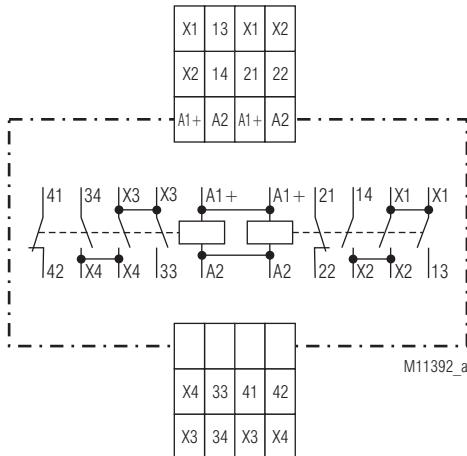

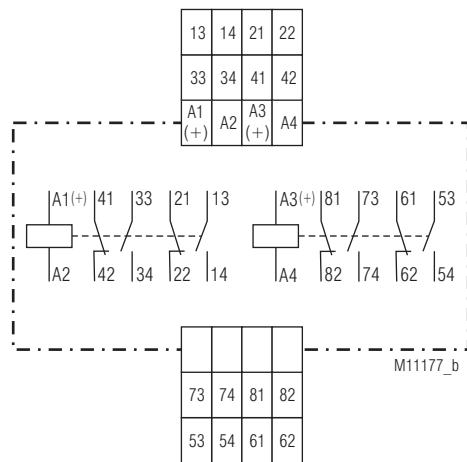

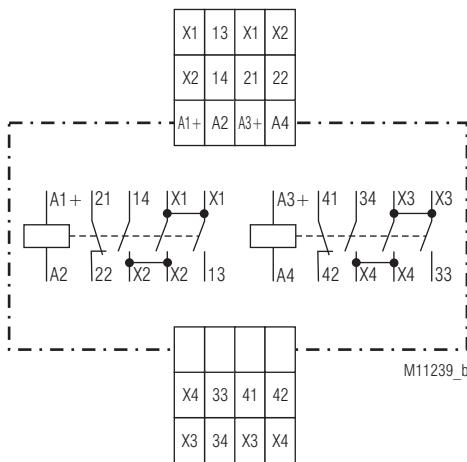

## Applications

- Interfacing between control and load circuits
- Contact multiplication and reinforcement
- Separate switching of several current circuits, e. g. at
  - Machines and plants
  - Energy production and transport

## Indicators

# Safety Technique / Control Technique

**SAFEMASTER**  
Interface Module  
HK 3087N

**DOLD**®

0273025

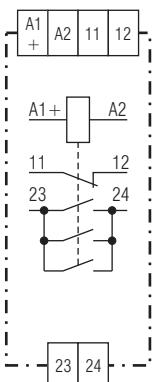

## Product Description

The interface module HK 3087N has forcibly guided contacts. Therefore it can be used to safely separate control and load circuits as well as to reinforce contacts of safety devices.

The interface module has a strong isolation between monitoring and load contact and is designed for high thermal current.

## Circuit Diagram

M11283\_a

HK 3087N.16

## Connection Terminals

Terminal designation	Signal description
A1+	+ 24 V DC Coil
A2	GND Coil
11, 12	Forcibly guided indicator contact
23, 24	Forcibly guided load contact

## Your Advantages

- Simple contact extension and re-inforcement also of safety modules
- Cost and space saving alternative compared to contactors
- Simple contact monitoring via forcibly guided NC contact
- Large wire cross section 0.5 - 6 mm<sup>2</sup> (10 - 24 AWG) reduces thermal load on wires

## Features

- According to IEC/EN 61810-1, IEC 60664-1,
- With forcibly guided contacts according to IEC 61810-3
- Models with soldered in PCB safety relay
- With polarity protected diode
- Optionally with free-wheeling diode across relay coil
- With LED indicator
- Optionally AgNi + 0,2 µm Au or AgNi + 5 µm Au
- For DIN rail mounting according IEC/EN 60715
- Clearance and creepage distance between NC and NO contact > 10 mm
- Width 22,5 mm

## Approvals and Markings

## Applications

- Interfacing between control and load circuits
- Contact extension and re-inforcement
- Separate switching of several current circuits, e. g. at
  - Machines and plants,
  - Energy production and transport

## Indicator

green LED: on, when supply connected

## Technical Data

### Input

**Nominal voltage  $U_N$ :** DC 24 V (andere auf Anfrage)  
**Voltage range:** 0,8 ... 1,2  $U_N$   
**Nominal consumption:** 1,0 W

### Output

## SAFEMASTER S Speed or Standstill Monitor BH 5932

**DOLD** 

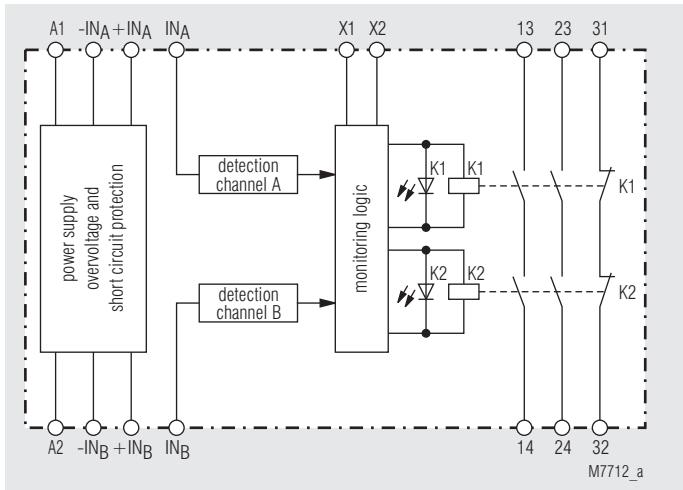

0223010

### Function Diagram

### Block Diagram

### According to

- Performance Level (PL) e and category 3 to EN ISO 13849-1
- SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
- Safety Integrity Level (SIL) 3 to IEC/EN 61508 and IEC/EN 61511

### For stop category 0 according to EN 418

- 2-channel input
- To monitor rotation and linear movement
- PNP proximity sensor inputs
- Optionally inputs for NPN proximity sensors
- Monitoring of connected sensor
- Fixed setting, adjustable as option
- Energized when speed is under setting value
- LED indication
- Feedback circuit X1 - X2 to monitor external contacts
- Forcibly guided contacts
- 2 NO, 1 NC contact
- Wire connection: also 2 x 1.5 mm<sup>2</sup> stranded ferruled (isolated), DIN 46 228-1/2-3/-4 or 2 x 2.5 mm<sup>2</sup> stranded ferruled DIN 46 228-1/2-3
- Width 45 mm

### Approvals and Markings

### Application

Monitoring of speed or standstill also during setup operation

### Indication

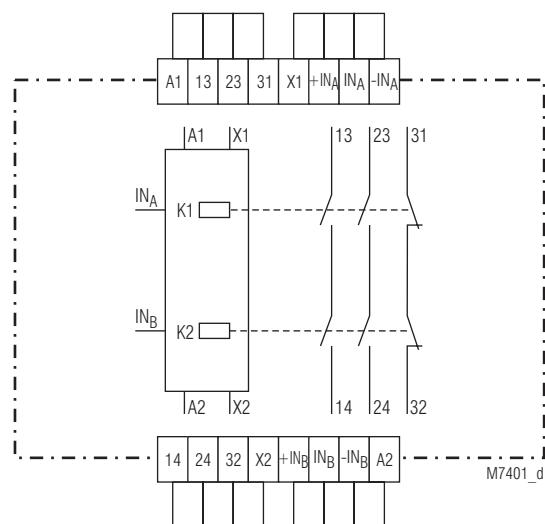

Standstill monitoring:

1. green LED: on, when supply voltage connected
2. green LED: on, when standstill detected on channel 1
3. green LED: on, when standstill detected on channel 2

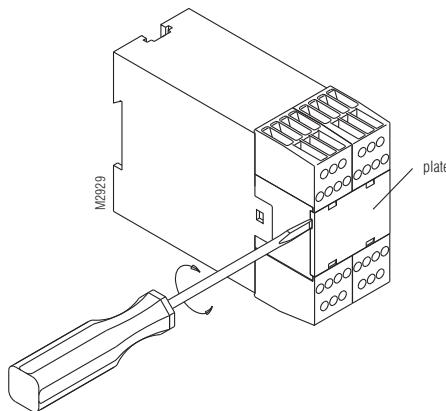

Overspeed monitoring:

1. green LED: on, when supply voltage connected
2. green LED: on, when no overspeed detected on channel 1
3. green LED: on, when no overspeed detected on channel 2

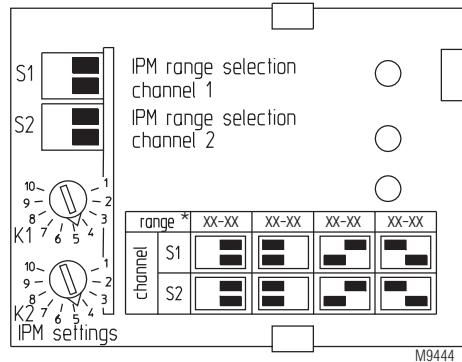

### Circuit Diagram

## Unit Programming

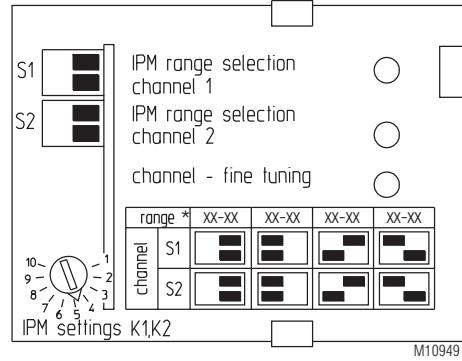

Model with separate adjustable channels

range\* : 8-60 / 60-450 / 450-3600 / 1800-14000 lpm  
or 20-110 / 120-900 / 950-7000 / 3700-26000 lpm

Only operate switches while unit is disconnected

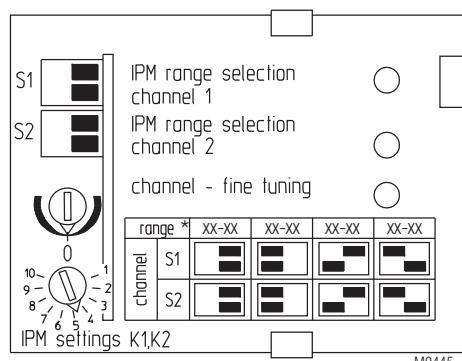

Model with common setting for both input channels

range\* : 8-60 / 60-450 / 450-3600 / 1800-14000 lpm  
or 7-90 / 60-700 / 470-5500 / 1800-21000 lpm

Only operate switches while unit is disconnected

Model with common setting for both input channels and fine tuning to synchronise both channels

range\* : 5-40 / 35-340 / 300-2700 / 1200-10500 lpm  
or 10-80 / 80-650 / 600-5300 / 2400-20000 lpm

## Notes

The device can be used for standstill and speed monitoring. All units have 2 sensing channels.

### Variants

Three main variants are available:

- BH 5932.22/\_0: Devices with fixed tripping value
- BH 5932.22/\_2: Devices with separate adjustment for both channels
- BH 5932.22/\_1: Devices with common adjustment for both channels
- BH 5932.22/\_3: Devices with common adjustment for both channels and fine tuning to synchronize both channels

### Setting ranges

On adjustable units the total range is split up in 4 sub ranges that can be selected with 2 DIP-switches per channel. To adjust the setting value in the selected range the potentiometers are used.

### Adjustment of setting range

The number of pulses [lpm] to be adjusted can be calculated using the following formula:

$$\text{Rpm} \times \text{number of sensing spots} = \text{lpm}$$

e.g. 7.5 Rpm x 2 sensing spots = 15 lpm

### Operation as standstill monitor

Both channels must be adjusted so that they switch simultaneously. The maximum time after standstill detection until switching of the output relays is depending on the adjusted lpm value. This delay can be calculated as follows:

$$\frac{60 \text{ s}}{\text{adjusted lpm-value}} + 2.5 \text{ s} = t_{vs}$$

$t_{vs}$  ≈ operate delay after standstill detection

e.g. at a setting of 15 lpm

$$\frac{60 \text{ s}}{15} + 2.5 \text{ s} = 6.5 \text{ s}$$

### Operation as overspeed monitor

Especially on overspeed monitoring it is necessary to adjust both channels precisely on simultaneous switching. If the two channels switch not at the same time the disconnection of the drive is only made with the faster channel. The speed can drop immediately so that the slower channel does not detect overspeed and remains switched on. A new start is then disabled and the relay does not switch on again. A restart is only possible by disconnecting the power supply. To achieve an accurate setting the lpm setting value should be in the middle part of the setting range. The adjustment of simultaneous switching is easier on units with separate setting for each channel as on units with fine tuning potentiometer.

### Proximity sensors

For safe operation the proximity sensors should be mounted vibration free. The position of the sensors should be chosen in a way that both sensors are operated simultaneously. Care must be taken that the sensors do not influence each other. The connection of the sensors to the supply is monitored. If there is an interruption in the sensor supply the corresponding output relay cannot be switched on, or if it is already on, it will switch off immediately. To achieve a fault free operation, the sensor must have draw at least 3 mA in off state. If sensors with lower consumption are used only devices without sensor detection can be operated. According to EN ISO 13849-1, the sensors must be checked for correct function in reasonable time intervals.

### Feedback circuit, reset, LEDs and timing

The reset circuit X1 - X2 must be closed before connecting the power supply. The unit is ready for operation after typically 1.5 sec after the supply is connected.

The LEDs channel 1 and channel 2 are on when the corresponding relay is energized. The output contacts of the relays will only be activated if both input channels reach the enabling condition within a time span of approx. 2 sec. If the response value is not reached on both channels within this time, e.g. because of a defective sensor or because the sensors do not simultaneously switch the output contacts are not enabled.

Only operate switches while unit is disconnected

## Technical Data

### Input

<b>Nominal voltage <math>U_N</math>:</b>	AC/DC 24 V AC 110, 230 V
<b>Voltage range</b>	
AC:	0.85 ... 1.1 $U_N$
DC:	0.9 ... 1.1 $U_N$
<b>Nominal consumption:</b>	approx. 4 VA, 2.5 W
<b>Nominal frequency</b>	50 / 60 Hz
<b>Frequency range:</b>	45 ... 65 Hz
<b>Start up reset time <math>t_{\text{Res}}</math>:</b>	1.5 s
<b>Hysteresis:</b>	typ. 6 %

### Inputs for NPN- or optional PNP Proximity Sensors

<b>Input voltage:</b>	DC 24 V
<b>Input current:</b>	max. 25 mA (per channel)
<b>Min. current of sensor</b>	3 mA
<b>Min. pulse time:</b>	1 ms On, 1 ms Off
<b>Max. lpm at inputs</b>	
<b>IN<sub>A</sub> und IN<sub>B</sub>:</b>	30000 lpm

### Speed Ranges [lpm]

#### Devices with fixed tripping value

BH 5932.22/_ _0:	15 / 30 / 60 / 120 lpm, fixed others on request (the output contacts close, when the speed is under the fixed lpm values)
Operate delay at standstill: Release delay on overspeed:	see formula $t_{\text{aus}} = \text{typ. } 700 \text{ ms}$

#### Devices with separate adjustment for both channels

BH 5932.22/_ _2	
Range 8 ... 14000 lpm:	adjustable in 4 subranges 8 ... 60, 60 ... 450, 450 ... 3600, 1800 ... 14000 lpm
or range 20 ... 26000 lpm:	adjustable in 4 subranges 20 ... 110, 120 ... 900, 950 ... 7000, 3700 ... 26000 lpm see formula

## Function Diagramm

## Flashing Codes

Flashing codes of the LED „ERR“ in sequence of priority

## Your Advantages

- Without sensor and safe
- Fast reaction time
- Easy to retrofit
- Combined with Interlock SAFEMASTER STS

## Features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL-Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508, IEC/EN 61511 and EN 61800-5-2
- Safe standstill detection on 3- and single-phase motors
- No external sensors necessary
- Independent of direction
- Broken wire detection
- Forcibly guided safety contacts:
  - 3 NO contacts, 1 NC contact for AC 250 V
  - 2 semiconductor monitoring outputs
  - 1 monitoring output (NO contact)
  - Adjustable voltage setting
  - Adjustable standstill time delay
  - LED indicators for standstill, event of line breakage and operation voltage
  - Suitable for operation with inverters
  - Width 45 mm

## Approvals and Markings

## Applications

Safe standstill detection on 3- and single-phase motors, e.g. to enable gate interlocks on machine tools or to activate hold in brakes.

## Function

The Standstill monitor LH5946 is suitable to monitor the standstill of all electric motors that generate a remanence voltage while coasting to stop. The LH 5946 is connected to the motor terminals and measures the induced back emf voltage. 2 redundant measuring channels are used (L2-L1 and L3 L1). If the back emf voltage drops to 0 simultaneously in both channels this indicates standstill and the output relay is energized.

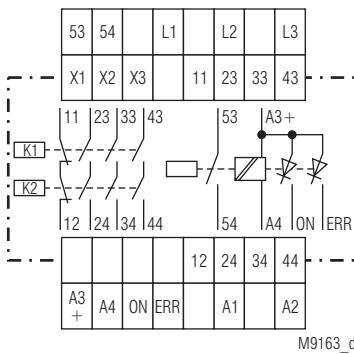

To adopt the unit to all different types of motors and applications the voltage threshold indicating standstill on LH 5946 is adjustable. Also the time delay between detection and energisation of the relay is adjustable (standstill time  $t_s$ ).

In addition the unit detects broken wire on the measuring inputs L1 / L2 / L3. If broken wire is detected the output relays goes into safe state (as with running motor). This state is stored and can be reset by bridging terminals X3-X2.

The input signals of both channels are permanently compared. If the signals are different for more than 2.5 sec a simultaneity failure is detected. This failure resets when both input channels receive simultaneous signals with a level, above the voltage threshold and hysteresis.

To the terminals X1-X2 the feedback circuit of external contactors (used for contact reinforcement) is connected (NC contact). If no feedback circuit is required, these terminals must be linked. Open terminals will cause a failure message.

## Circuit Diagram

## Function

The LH 5946 can be used for standstill detection on all 3-phase, single phase and DC motors, that generate a voltage caused by remanence when freewheeling. As the voltage level  $U_{an}$  for standstill monitoring and the time delay  $t_s$ , after detection of standstill until the safety relays are switched on, are adjustable, the function can be adopted to different motors and applications.

### Basic function of LH 5946

The auxiliary voltage is connected to the terminals A1-A2; the LED „UH“ lights up green. On undervoltage or missing auxiliary supply the safety outputs are disabled.

If semiconductor monitoring outputs are used, their supply voltage must be connected to A3(+)-A4.

A motor connected to the terminals L1-L2-L3 of the LH 5946 generates a voltage when running down (motor is switched off). The voltage is proportional to the speed and caused by residual magnetism (remanence). This voltage is measured redundant on 2 input channels via the terminals L2 and L3 with L1 as common reference.

If the voltage drops on both channels below the adjusted value  $U_{an}$ , the unit detects standstill. When the terminals X1-X2 of the feedback circuit are bridged and the time delay  $t_s$  is finished, the safety contacts 23-24, 33-34 and 43-44 close while contact 11-12 opens. All 4 contact paths have 2 forcibly guided contacts of 2 safety relays wired in series.

At the same time the monitoring relay energises (53-54 closes), the semiconductor output „ON“ is switched on and the LED „OUT“ lights green. During time delay  $t_s$  this LED flashes.

If the voltage measured on terminals L1-L2-L3 of LH 5946 rises over the adjusted value plus hysteresis in at least one channel (the motor is switched on or the shaft turns mechanically), the forcibly guided output contacts are switched off immediately (contacts 23-24, 33-34 and 43-44 open while contact 11-12 closes). The monitoring relay de-energises (53-54 opened), the semiconductor output „ON“ goes off and the LED „OUT“ lights yellow (=  $U_{an}$  over adjusted value).

## Connection Terminals

Terminal designation	Signal description
L1 - L2 - L3	Connection to monitored motor
11 - 12	Safety contacts (NC)
23 - 24, 33 - 34, 43 - 44	Safety contacts (NO)
53 - 54	Monitoring contact (NO)
X1 - X2	Connection of feedback circuit (for external contactors)
X2 - X3	Manual reset for external faults
A1 - A2	Auxiliary supply ( $U_H$ )
A3(+) - A4	Supply for semiconductor outputs
ON:	Semiconductor output indicates state of safety contacts
ERR:	Semiconductor output indicates failures

**Attention: The outputs 53-54, ON and ERR are only monitoring outputs and must not be used in safety circuits!**

## Indicators

green-red LED „UH“:	green on, when operation red on, with internal error
yellow-green LED „OUT“:	yellow on, at $EMK > U_{an}$ flashes green at time progression of $t_s$ permanent on, when output contacts are enable
red LED „ERR“:	flashes at error in measuring and feedback circuit and low auxiliary voltage $U_H$ (see flashing codes)

### Feedback circuit X1 - X2

If the safety contacts control external contactors/components (e.g. to reinforce or multiply the contacts) the safety function of them must be monitored.

This is done with the feed back circuit (terminals X1-X2) to which the NC contacts of the contactors/components must be connected. (see also wiring diagrams).

The LH 5946 will only enable its safety output if the feedback loop X1-X2 is closed while standstill is detected, i.e. the external contactors/components are in initial state (NC contacts are closed).

The feedback circuit X1-X2 must be closed as long as the safety outputs (because of running motor or external failure) are not enabled. If not the failure „feedback circuit“ is indicated.

If the feedback circuit is not used, the terminals X1-X2 must be bridged.

## Function

### Failure monitoring

The LH 5946 includes a number of facilities to detect failures that could influence the safety function of the module. The failure check is carried out on power up of the unit and in cycles during normal operation. If a failure occurs the output relays switch off. The failure state is indicated with the LEDs „ERR“ and „UH“ and the semiconductor output „ERR“ switches on. With safety relevant failures the unit differentiates between external failures (broken wire / offset, simultaneity failure, feedback circuit failure) and internal failures.

Broken wire / offset failures and feedback circuit failures can be stored or automatic reset after removing the fault. (see chapter failure storing).

#### Broken wire / offset

The connection wires between LH 5946 and motor are continuously monitored for broken wire and on a DC-voltage offset higher than  $U_{an}$ . In the case of a broken wire or offset failure the output relays are switched off immediately and the LED „OUT“ lights yellow. In addition a failure signal comes up with delay (on broken wire after 2 s on offset failure after 8 s): the semiconductor output „ERR“ switches on and the LED „ERR“ flashes with failure code 2 or 3 depending on the failure located either between L1-L2 or L1-L3.

#### Simultaneity of the measuring signals

As additional safety feature the 2 input signals (L2 and L3) are compared continuously. This allows to detect also internal failures in one measuring channel.

If the signals are different for at least 2.5 s (one channel  $>U_{an}$  the other  $<U_{an}$ ) simultaneity failure is detected. The semiconductor output „ERR“ is switched on and the LED „ERR“ flashes with failure code 5.

If the measured signals return to the same level  $<U_{an}$  the error remains stored and the outputs are disabled.

The simultaneity failure is only reset when both channels return to  $>U_{an}$ . If after that both channels drop below the setting value, get  $<U_{an}$  the output relays will switch on.

#### Failure in feedback circuit X1-X2

As already mentioned the failure code „feedback circuit“ occurs when the outputs are disabled and there is no connection between terminal X1-X2. The semiconductor output „ERR“ is switched on and the LED „ERR“ flashes with failure code 4.

Also when both input signals drop now to  $<U_{an}$  and besides the open feedback loop no other failures are present the feedback circuit failure remains active and the outputs remain disabled.

If the feedback circuit is now closed and the unit is on auto reset for external failures (see failure storing) the output relays are enable and switch on.

#### Potentiometer error

To achieve the required safety when adjusting the voltage threshold for standstill detection, each setting function is realised with 2 potentiometers having one common setting knob. If on 2 corresponding potentiometers a different setting is detected the potentiometer error  $U_{an}$  or  $t_s$  is displayed.

To remove the failure please try to readjust the potentiometer. Please make sure that you feel the detent

#### Internal device failure

Internal failures are always stored, independent of the reset input X3 and cause the output relays immediately to switch off, the semiconductor output „ERR“ to switch on and the LED „UH“ to change its colour from green to red.

Examples for internal failures:

- Failure on safety relays e.g. welded output contacts
- Internal failures on measuring channels and measuring circuits
- Internal failures on control circuits for the safety relays
- failures on setting potentiometers for  $U_{an}$  and  $t_s$
- Undervoltage failure (LED „ERR“ flashes with failure code 1)

## Function

### Failure indication with flash code of LED „ERR“

The flash codes indicate failures caused externally (see diagram flashing codes for failure indication on page 9). A series of flash pulses 1-7 followed by a slightly longer space is displayed. The flash code indicates the type of failure. If several failures are present at the same time only the failure with the highest priority (lowest flash code) is shown. When this failure is removed the other existing failures are displayed in the same way according to their priority.

#### Failure storing / reset (terminals X2-X3)

With the external failures broken wire/offset and feedback circuit the operator can choose between manual and automatic reset after the failure is removed.

X2-X3 open:	manual reset
X2-X3 closed:	automatic reset

#### ! Attention

**The a.m. storing function of the external failures broken wire /offset, and feedback circuit is not a safety function. I.e. in respect to safety aspects it can not be regarded as guaranteed. The reset for these failures must be therefore regarded as auto reset after removing the faults.**

**Internal device failures that could occur in seldom cases (e.g. caused by temporary interference) can be reset by switching the supply voltage off and on. If a reset is not possible also if the voltage is applied correctly, the device could be defective and should be sent back to the manufacturer for examination or repair.**

## Connection of LH 5946

The LH 5946 has to be connected according to connection examples or in a similar way. The connection of DC-motors is made as with single phase AC-motors.

### L1 - L2 - L3

The measuring wires L1-L2-L3 have to be connected directly to the windings of the monitored motor (not via transformers) in order to provide a correct broken wire detection for the connection wires and motor windings. The motor windings must not be disconnected from the measuring wires by motor contactors, because broken wire detection is activated and standstill monitoring is disabled.

Interference to the measuring wires should be avoided as no standstill may be detected by the LH 5946. If possible the measuring wires should be run separately from the motor wires or screened wires should be used. In this case the screen can be connected at the motor side.

### A1 - A2

Connection of the auxiliary supply, recommended fuse : 2A.

### A3+ / A4

DC 24 V supply (12 ... 30 V) for the semiconductor monitoring outputs „ON“ and „ERR“, if these are used.

11-12, 23-24, 33-34, 43-44

Safety output contacts, connection according to the connection examples or similar.

Recommended fuse: 5 A fast acting, to avoid welding of the contacts in the case of external wiring or component failures. See also technical data.

53 - 54

Monitoring contact to indicate the state of the safety output (non safety contact)

### X1 - X2 (feedback circuit)

Connection of NC contacts of external components or contactors for contact re-enforcement, must be linked if not used.

### X2 - X3

Connection for manual or auto reset, connection is made according to the required application. When monitoring DC motors or in the case of DC-braking the broken wire / offset failure will be shown during operation. In this case the terminals must be linked because if storing the failure would not allow activation of the safety contacts at standstill.

### Attention

The terminals X1-X2-X3 have electrical connections to the measuring inputs L1-L2-L3. Volt free contacts must be used for bridging. If terminal X3 should be controlled by a PLC via an interface relay this must have the necessary insulation between the motor voltage (measuring input) and PLC potential.

## Operation Notes

### Motors with switched windings

(e.g. star delta starters, reversing circuits, multi speed motors)

With these applications please make sure, that the measuring inputs must be linked via the motor windings. An open connection will result in broken wire indication and disable the safety contacts.

When connecting the LH 5946 to a 3-phase motor with star delta starter the star contactor must be energized while the motor is switched off, in order to achieve closed circuits between L1-L2-L3 via the motor windings.

If it is not possible to switch in the star contactor after the motor is switched off, the measuring inputs of the LH 5946 have to be connected like a single phase connection. L2-L3 are bridged and connected to one end of a motor winding and L1 to the other end of the same winding.

For reversing circuits and multi speed motors please follow the same procedure.

If in a 3-phase connection of LH 5946 windings are switched over, and the interruptions of the measuring circuits are longer than 2 s, the standstill monitor detects broken wire. In order not to store this failure, the unit should work with auto reset.

### Operation with DC motors

The LH 5946 can be used on DC motors if these generate a remanence voltage during run down.

The connection is made similar as with a single phase motor.

As the remanence voltage in this case is normally a DC voltage the unit will detect a broken wire / offset failure and indicate it on LED „ERR“ and semiconductor output „ERR“. Taking this in mind and operating the unit with auto reset for these failures the unit can be used for safety standstill monitoring.

### Operation with electronic motor controller

(inverters, DC-brakes)

The operation of LH 5946 to detect standstill on motors with electronic motor control is possible, if the output voltage of the motor controller drops under the adjusted response value on standstill. (No position control on inverters, no DC voltage on brakes after standstill).

If the inverter produces a DC offset or a DC brake is active, an offset or broken wire failure is indicated on LED „ERR“ and semiconductor output „ERR“. This error resets automatically if on terminals X2-X3 automatic reset is selected.

When there are inverters in the installation it is recommended to use screened measuring wires to the motor. The screen can be connected to the motor.

### ! Attention

If the motor current is run down by inverters or softstop modules in a slow way the motor may be de-magnetised. It is necessary to check if the remaining remanence voltage is sufficient to guarantee a correct and safe standstill monitoring. At high frequencies an increasing damping of the measuring inputs has to be taken into account (see technical data Measuring input „response value dependant on frequency“).

## Setup and Setting

### Preparation

- Motor on standstill
- Terminals L1-L2-L3 connected to the motor windings
- Provide link on terminals X1-X2
- Provide also link on X2-X3 on DC motors or DC braking
- Adjust  $U_{an}$  to minimum
- Adjust  $t_s$  to minimum (0.2 s)

Connect correct auxiliary voltage to terminals A1-A2

⇒ After 1 sec the LEDs „UH“ and „OUT“ light up green and the safety contacts are switched on. Also the monitoring relay and the semiconductor output „ON“ must be activated.

If standstill is not detected (LED „OUT“ lights yellow), possibly interference is coupled on the measuring circuit. Adjust  $U_{an}$  higher or screen the measuring wires.

### Start of motor

⇒ LED „OUT“ changes colour to yellow. The output relays and the semiconductor output „ON“ switch off. On DC motors the LED „ERR“ starts to flash after 2 s with flash code 2 and the output „ERR“ comes on.

### Stop of motor – run down DC braking off

The speed at which standstill is detected (yellow LED „OUT“ changes to green/green flashing) can be adjusted on Potentiometer „ $U_{an}$ “. When the run down is slow or irregular the time delay must possibly be increased to avoid switching on and off of the output relays. Possibly this effect can also be avoided by slightly increasing  $U_{an}$ . During time delay  $t_s$  the LED „OUT“ flashes green.

If standstill detection shall only take place at very low speed of the motor,  $U_{an}$  is set normally to minimum. By increasing the delay time  $t_s$  a possible pulsing of the output relays can be avoided. A longer time delay will also guarantee standstill detection only when the motor has already stopped turning. (especially on motors that generate only a small remanence voltage).

On slow decrease of motor speed it is possible that a simultaneity failure occurs (see failure monitoring) when the measuring channels reach the tripping values slowly and not within 2.5 sec. To avoid this failure a single phase connection could be the solution (to make sure that both inputs get the same signal) or the increase of the setting value  $U_{an}$ .

If the run down time of the motor is short  $t_s$  can be set to a minimum (0.2 s). This is suitable in production systems to shorten machine cycles.

### ! Attention

**It is the responsibility of the user to adjust  $U_{an}$  and  $t_s$  in a way that standstill detection and enabling of the safety contacts in the application is only possible when danger to men and material by the rotating can be excluded.**

## Technical Data

### Input (L1 - L2 - L3)

<b>Measuring-/Motor voltage:</b>	max. AC 690 V
<b>Input resistance:</b>	500 kΩ
<b>Response value <math>U_{an}</math>:</b>	20 mV ... 400 mV, adjustable or 0.2 ... 4 V, adjustable

### Response value dependent on frequency

Input frequency (Hz):	50	100	200	400	600	1k	1,5k	2k
Multiplication factor for $U_{an}$ :	1,0	1,1	1,2	1,5	2,0	2,8	5	8

**Hysteresis (for detection of running motor):** 100 %

**Release delay for detection of running motor:** < 100 ms

**Standstill time delay  $t_s$ :** 0.2 ... 6 s adjustable

**Auxiliary voltage  $U_H$  (A1 - A2):** AC 115 V, AC 230 V, AC 400 V, DC 24 V

**Recommended fusing:** 2 A

### Voltage range

AC: 0.8 ... 1.1  $U_N$

DC: 0.9 ... 1.2  $U_N$

**Nominal consumption:** 5 VA, 3 W

**Nominal frequency (AC):** 50 / 60 Hz

**Frequency range (AC):** 45 ... 65 Hz

**max. residual ripple (DC):** 10 %

**Start up delay when connecting  $U_H$  at standstill:** 0,4 ... 0,8 s + adjustable  $t_s$

### Output

#### Contacts

##### (safety contacts)

LH 5946.48: 3 NO contacts, 1 NC contact

**Contact type:** relay, positive guide

**Nominal output voltage:** AC 250 V

**Thermal current  $I_{th}$ :** 5 A (bis 40°C)

**Quadratic total current:** see derating curve

##### Switching capacity

to AC 15

NO contact: 3 A / AC 230 V IEC/EN 60 947-5-1

NC contact: 2 A / AC 230 V IEC/EN 60 947-5-1

to DC 13

NO contact: 1 A / DC 24 V IEC/EN 60 947-5-1

NC contact: 1 A / DC 24 V IEC/EN 60 947-5-1

to DC 13

NO contact: 4 A / 24 V at 0.1 Hz IEC/EN 60 947-5-1

NC contact: 4 A / 24 V at 0.1 Hz IEC/EN 60 947-5-1

**Fusing of the safety contacts:** max. fuse rating 4AgL  
line circuit breaker C6A

1200 / h

**Max. operating frequency:** ≥ 2 x 10<sup>5</sup> switching cycles

**Contact service life:** ≥ 50 x 10<sup>6</sup> switching cycles

**Semiconductor monitoring output:**

100 mA DC 24 V, plus switching,  
galvanic separation; supply via  
A3+ / A4 for output; „ON“ and „ERR“

3 A AC 250 V (closed when enabled)

**NO monitoring contact:**

## Technical Data

### General Data

<b>Nominal operating mode:</b>	continuous operation
<b>Temperature range</b>	
operation:	- 25 ... + 60°C (+ 40°C with max. contact current, see Derating)
storage:	- 40 ... + 75°C
<b>Altitude:</b>	< 2.000 m
<b>Clearance and creepage distance</b>	
rated impulse voltage / pollution degree:	IEC 60 664-1
Contacts 11/12, 23/24, 33/34, 43/44 against all others:	6 kV / 2
Contacts 11/12, 23/24, 33/34, 43/44 against each others:	4 kV / 2
Indicator contact 53/54 against all others:	4 kV / 2
Semiconductor outputs A3+/ ON / ERR / A4 against all others:	6 kV / 2
Auxiliary voltage A1 / A2 against all others	
at auxiliary voltage AC:	6 kV / 2
at auxiliary voltage DC:	4 kV / 2
Control terminal X1 / X2 / X3:	no galvanic separation to L1 / L2 / L3
<b>EMC</b>	IEC/EN 62 061
Interference suppression	
Auxiliary voltage AC:	limit value class B EN 55 011
Auxiliary voltage DC:	limit value class A*) EN 55 011

\*) The device is designed for the usage under industrial conditions (Class A, EN 55011). When connected to a low voltage public system (Class B, EN 55011) radio interference can be generated. To avoid this, appropriate measures have to be taken.

### Degree of protection

Housing:	IP 40 IEC/EN 60 529
Terminals:	IP 20 IEC/EN 60 529
<b>Enclosure:</b>	thermoplastic with VO behaviour according to UL subject 94 amplitude 0.35 mm frequency 10 ... 55 Hz, IEC/EN 60 068-2-6
<b>Vibration resistance:</b>	25 / 060 / 04 IEC/EN 60 068-1
<b>Climate resistance:</b>	EN 50 005
<b>Terminal designation:</b>	DIN 46 228-1/-2/-3/-4
<b>Wire connection</b>	60°C Copper conductors only Plus-minus terminal screws M 3.5
<b>UL detail:</b>	box terminals with wire protection or cage clamp terminals
<b>Wire fixing:</b>	DIN-rail IEC/EN 60 715 approx. 400 g

### Dimensions

**Width x height x depth:** 45 x 90 x 121 mm

## UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL 508, "general use applications"

<b>Auxiliary voltage U<sub>H</sub></b> for DC 24 V:	Device must be supplied with a Class 2 or a voltage / current limited power supply (max. 4 A).
<b>Measuring-/Motor voltage:</b>	max. AC 600 V
<b>Ambient temperature:</b>	- 25 ... + 60°C, (+ 40°C with max. contact current, see Derating)

## Characteristic

Quadratic total current

$$\Sigma = I_1^2 + I_2^2 + I_3^2$$

$I_1, I_2, I_3$  - current in contact paths

max. permitted current up to 40°C on 3 contact paths = 5A

$$(5+5+5 = 15A)$$

max. permitted current up to 60°C on 3 contact paths = 2A

$$(2+2+2 = 6A)$$

Derating curve for contact currents of safety contacts

## Troubleshooting

### Failure:

The unit enables the safety outputs while the motor is still turning (LED „OUT“ lights green).

### Solution:

Reduce setting of  $U_{an}$  if necessary to minimum. If the outputs are still enabled a wiring problem on the measuring wires could be the reason (short circuit on terminals L2/L3 to L1) or the motor generates only a very low remanence voltage. Please check connection of measuring inputs to motor winding according to the connection examples.

### Failure:

The output contacts are enabled too early (motor has not finally stopped).

### Solution:

Adjust setting value  $U_{an}$  to lower level. Additionally the delay time  $t_s$  could be increased.

### Failure:

Output contacts remain disabled while the motor is already on standstill

### Solution:

Observe status of indicator LEDs:

#### 1. LED „UH“ lights green?

If yes, go to 2.

If no,  $U_H$  has undervoltage or the unit has an internal device failure. (Internal failures can occur in the case of undervoltage, welded safety output contacts or seldom because of interference)

⇒ switch supply voltage off and on. If the failure still exists in spite of correct auxiliary supply  $U_H$  the unit could be defective and has to be sent to manufacturer for test or repair.

#### 2. LED „ERR“ (red) flashes with code 1?

If no, go to 3.

If yes, the unit has detected undervoltage

⇒ Apply correct auxiliary voltage

#### 3. LED „OUT“ flashes green?

If no, go to 4.

If yes, standstill is detected, but the time  $t_s$  till enabling of the outputs is not elapsed.

⇒ wait till time  $t_s$  is finished.

If after 6 s the outputs are not enabled, the measuring input L1-L2-L3 receives intermittent voltage peaks that are higher than  $U_{an}$ .

This should normally be indicated by intermittent yellow flashes on the LED).

⇒ Adjust  $U_{an}$  to a higher value, clear interference on measuring wires (use screened cables).

#### 4. LED „OUT“ lights yellow?

If yes, the voltage on the measuring input is higher than the adjusted value  $U_{an}$ ; go to 5.

If no, LED is off

Standstill is detected (voltage on measuring input is  $< U_{an}$ ) but the outputs are not enabled because

- a) Feedback circuit X1-X2 is not closed or
- b) a simultaneity failure occurred (see failure monitoring) or
- c) a previous failure (broken wire / offset, feedback circuit) is still stored (terminals x2-x3 are not linked).

The type of failure is indicated by flash code on the red LED „ERR“:

- a) flash code 4 (feedback circuit not closed)
- b) flash code 5 (simultaneity fault of the measuring signals on L2 L3)
- c) code 2, 3 or 4 depending on priority and failure.

⇒ - close feedback circuit  
- Bridge terminals X2-X3 (manual reset)

If now still the simultaneity failure (flash code 5 on LED „ERR“) is indicated it can be reset by switching the auxiliary supply off and on. The reset also takes place, when both input signals rise above  $U_{an}$  e.g. when starting the motor. If the simultaneity failure remains active after start of the motor (e.g. because of short circuit between L2-L1 or L3-L1) the wiring of the measuring circuit has to be checked according to the connection example.

If the simultaneity failure occurs often e.g. on slow decrease of the motor speed, the problem can be solved by increasing the tripping value  $U_{an}$  or/and by making a single phase instead of a 3-phase connection of the measuring circuit to the motor.

## Troubleshooting

### 5. LED „OUT“ lights yellow while the motor is on standstill

If the yellow LED „OUT“ is on this indicates that the measuring inputs still receive an input signal higher than the adjusted value  $U_{an}$

Observe in addition the LED „ERR“:

- a) if it stays off after a time of 8 s the problem could be a interference or residual voltage (induced AC voltage) on the measuring inputs  
⇒ Increase the setting of  $U_{an}$   
If this shows no result, or if an increase is not wished, the interference to the measuring lines must be reduced e.g. by screening, shortening or separating the wires, Test: Disconnect motor and short circuit terminals L1-L2-L3 on the unit, the yellow LED must change to green or green flashing.
- b) if the red LED flashes code 2 the unit has detected broken wire or DC voltage offset between the measuring inputs L1 and L2 (or between L1 and L2 and L1 and L3).
- c) if the red LED flashes code 3 the unit has detected broken wire or DC voltage offset on measuring input L3

In the 2 last cases the wiring between LH 5946 terminals L1-L2-L3 and the motor terminals has to be checked on interruption. Possibly the interruption comes from disregarding the operating remarks for motors with switchable windings (see remarks).

If failures by interruption of the input circuits can be excluded the failure can result from a DC voltage offset  $> U_{an}$ . This can come from motor controllers like inverters or DC brakes that are not completely switched off and supply a DC-voltage to the measuring circuit (check with Voltmeter). If the DC content is only minor, the failure can be removed by increasing the setting value  $U_{an}$ . The yellow LED „OUT“ must change to green or green flashing. If not the motor controllers must be switched off in a way that standstill can be detected correctly.

### Failure:

While motor is on operation a failure is indicated.

If the LED „UH“ lights red, an internal failure occurred.

### Solution:

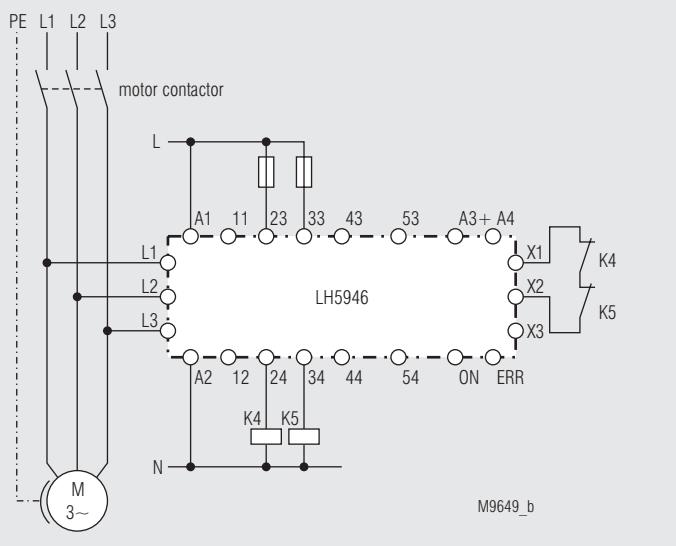

Switch auxiliary supply off and on again (see 1.).

If the LED „ERR“ indicates a failure the flash code shows the type of fault and how to remove it. Flash code 2 or 3 are normal during operation of DC motors. If the terminals X2-X3 are bridged, The failure is reset automatically at standstill and the output relays are enabled. The same is valid for operation with electronic controllers, if these produce a DC voltage e.g. during braking of a DC-brake.

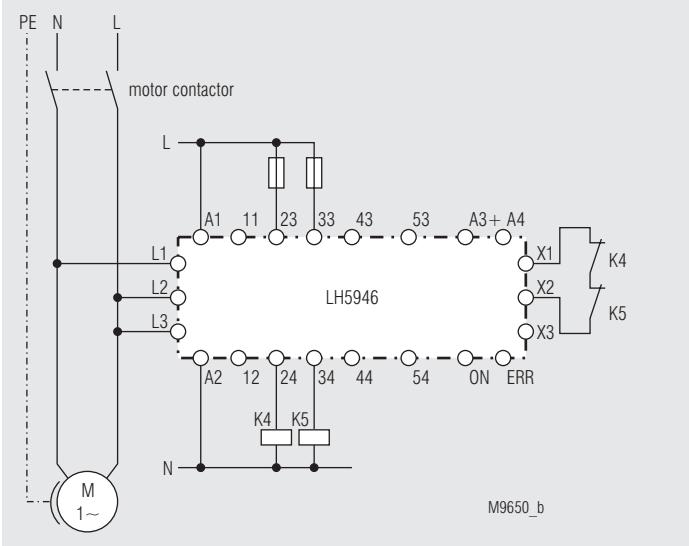

## Maintenance and Repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

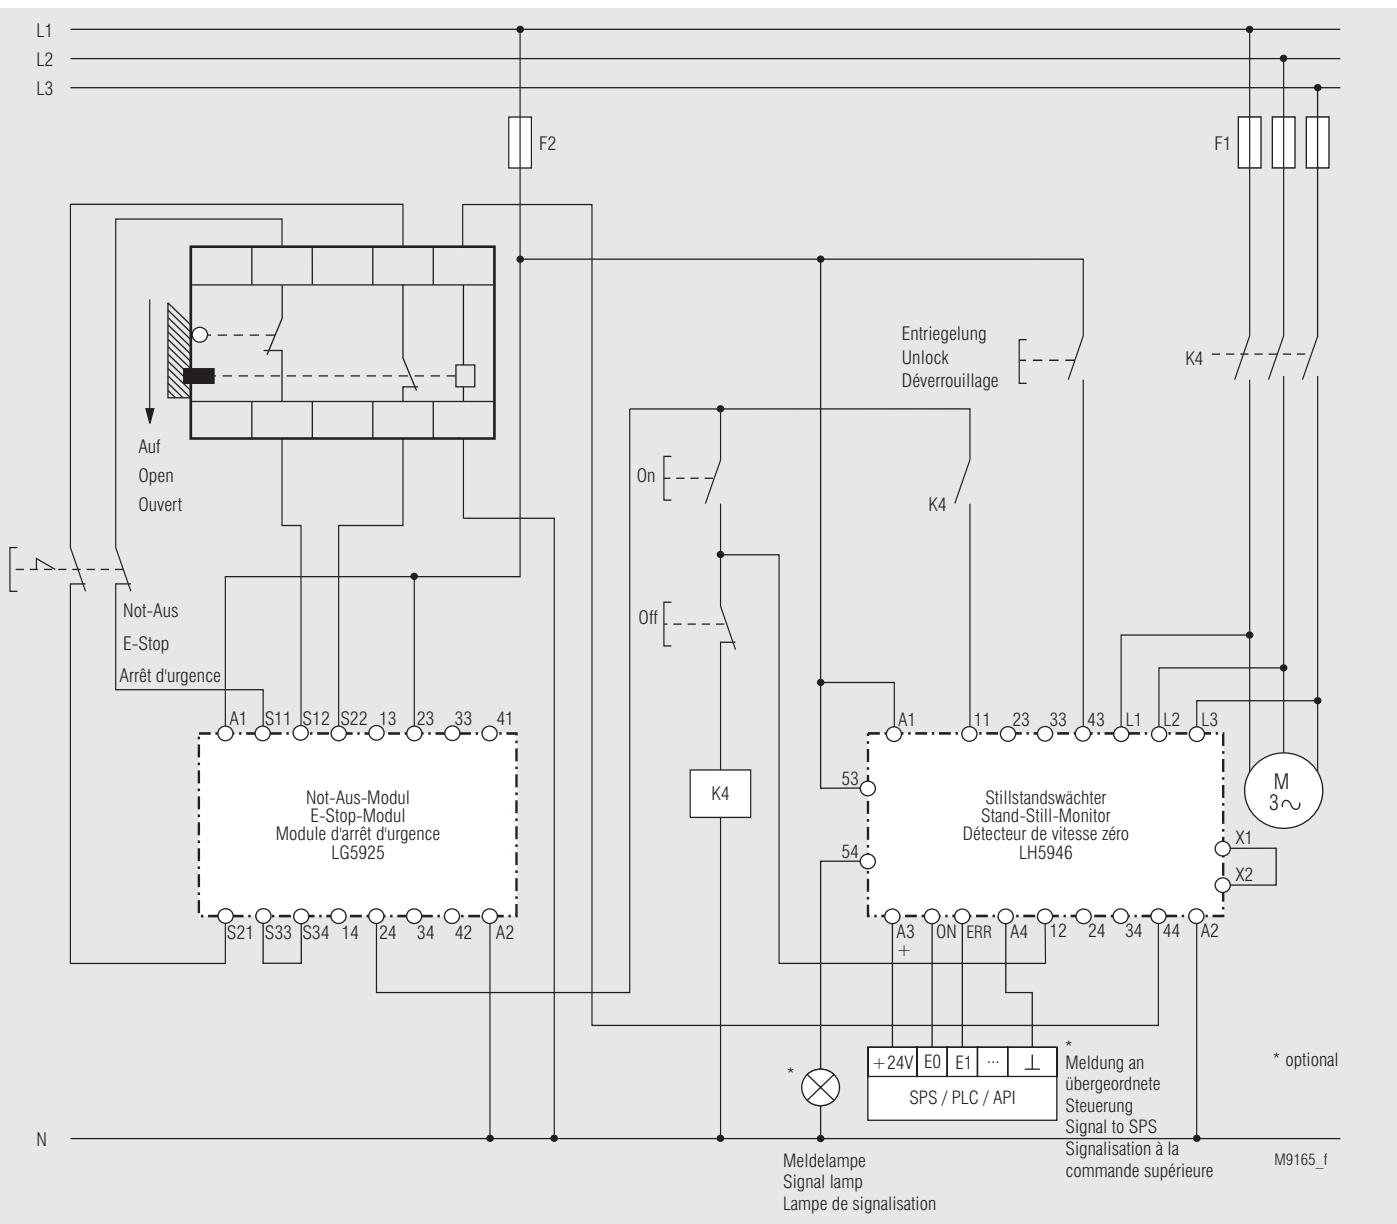

## Connection Examples

With 3-phase motor; suitable up to SIL3, Performance Level e, Cat. 4

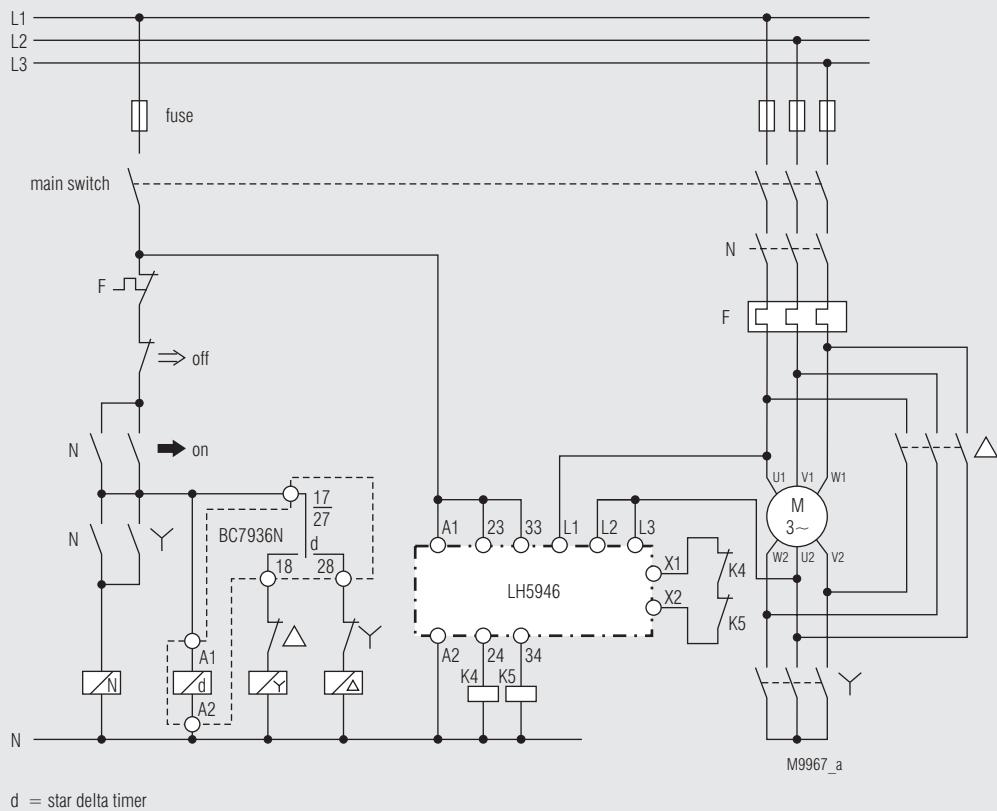

With single-phase motor; suitable up to SIL3, Performance Level e, Cat. 4

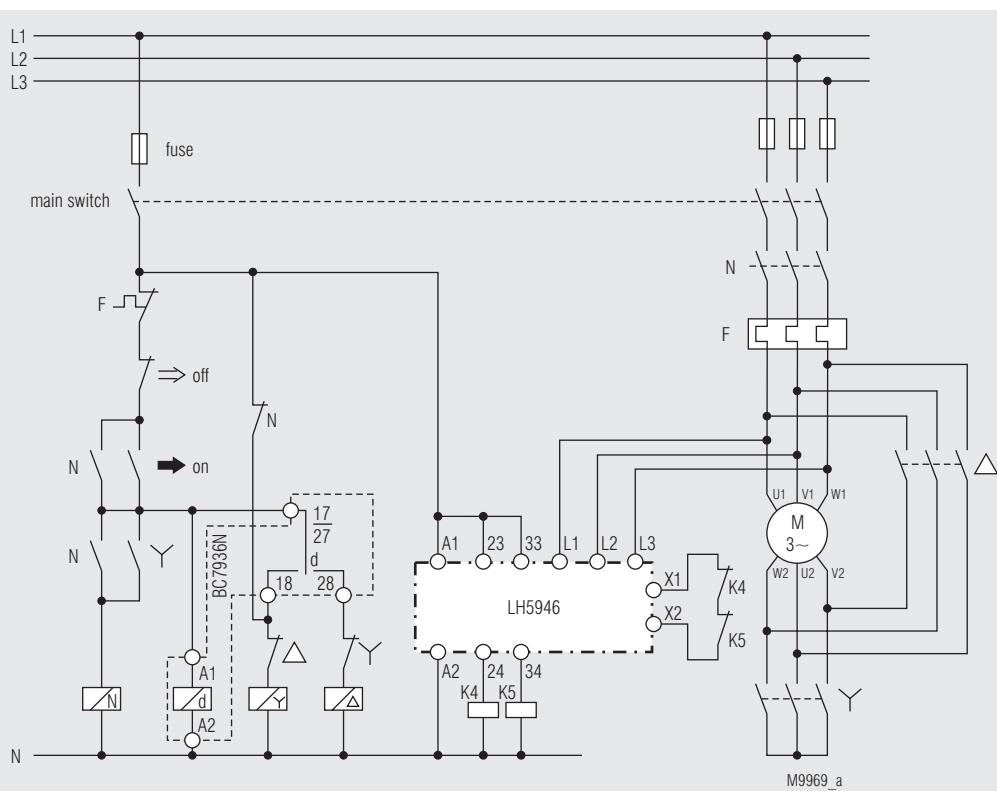

Typical connection combination with E-Stop; suitable up to SIL3, Performance Level e, Cat. 4

## Application Examples

Typical connection combination with star delta timer, 2-channel connection of the measuring inputs; suitable up to SIL3, Performance Level e, Cat. 4

Legend:  
 d = star delta timer

 Y = star-contactor  
 △ = triangle contactor

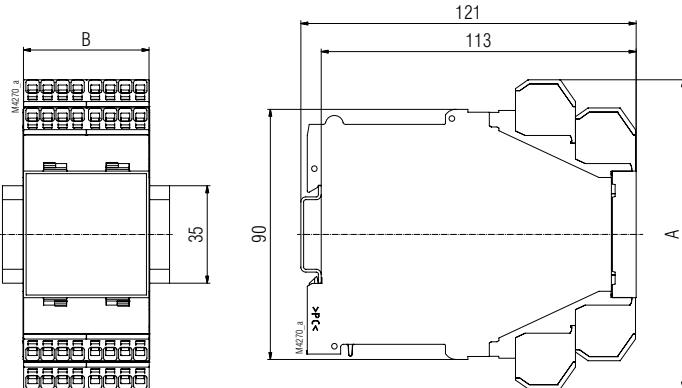

With "3-phase" connection of LH5946 the star contactor (Y) has to be closed after the motor is switched off to detect standstill. If this is not the case the failure signal "broken wire" blocks the output contacts in off position.

Typical connection combination with star delta timer, 3-channel connection of the measuring inputs; suitable up to SIL3, Performance Level e, Cat. 4

## SAFEMASTER S Speed Monitor UH 5947

**DOLD** 

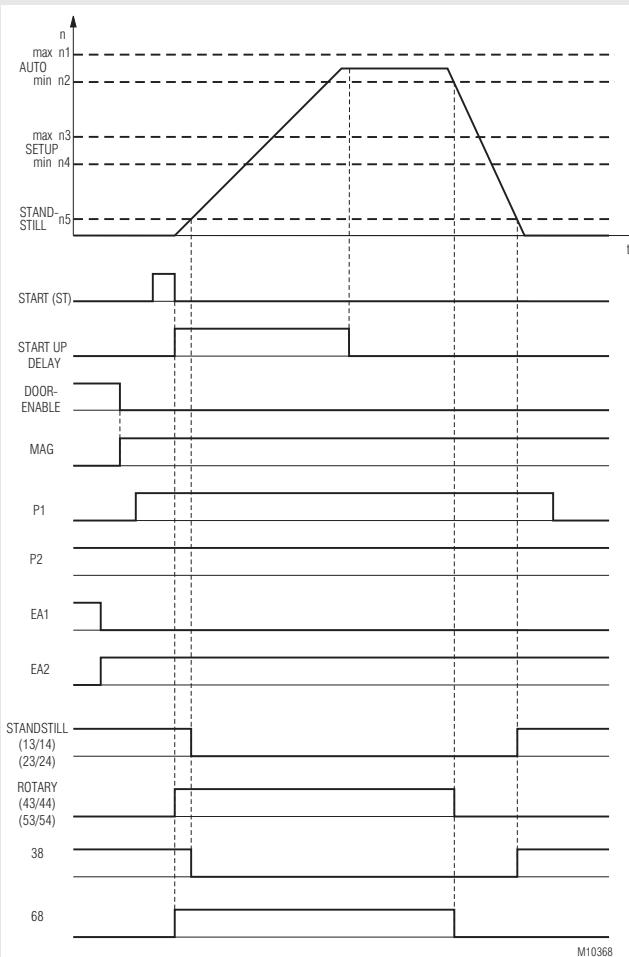

0263984

### Product Description

The speed monitor UH 5947 provides safe monitoring of motors and rotating equipment. It is used in machines and plants where machine movements or moving parts can be a danger to men and machine. Using the front side display the parameters can be easily and comfortably adapted to the individual application or changed when necessary.

### Function Diagram

### Your Advantages

- Three in one
  - safe speed monitoring in automatic and set up operation
  - safe standstill monitoring
  - safe integrated gate monitoring
- For safety applications up to PL e / Cat 4 and SIL 3
- Space and costsaving, no external safe gate monitoring required
- Simple and time saving setup without PC
- Comfortable, menu guided configuration via frontside display
- Reducing interruption time in production by extensive diagnostic functions
- Easy to integrate in existing drive applications
- Suitable for all common motor feedback systems and proximity sensors
- Copy parameter settings in other units by pressing only a push button
- Higher safety by 2-channel mode selector, external connection
- With adjustable ratio between 2 sensors e.g. to detect a broken shaft
- Possible languages: english, german, french, italian, spanish

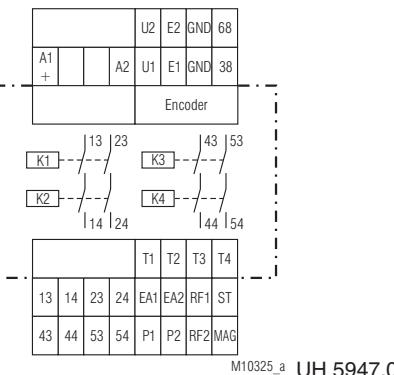

### Features

- According to
  - Performance Level (PL) e und category 4 to EN ISO 13849-1
  - SIL-Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL 3) to IEC/EN 61508
- According to EN 60204
- Device setting on menu-driven display or via RJ45 (FCC Western-Modular 8P8C) with connection cable (copy function)
- Change tracking
- Adjustable operation mode
  - Automatic mode: Monitoring of automatic rotational speed window and standstill speed.
  - Setup mode: Monitoring of setup rotational speed window. Standstill is permanently enabled.
- Single or 2-channel safety gate monitoring
- Integrated user friendly display for parameters and operation status
  - for set point and actual value of U/min or m/min
  - set point display also as frequency value
  - with numerous diagnostic features
- Adjustable start up delay (0 ... 999 s)
- Adjustable time delay for standstill detection (13/14, 23/24) (0 ... 999 s)
- Adjustable monitoring time for feedback circuit RF1 (0,5 ... 999 s)
- Monitoring of an release magnet
- Monitoring of feedback circuits
- Activation of the output path 43/44, 53/54 with on/off pushbutton with short circuit detection or automatic making function
- Adjustable PNP- or NPN-sensors
- Connection of different encoders possible (sin/cos, TTL, HTL)
- 2-channel function
- Forcibly guided contacts
- LED-indicators and 2 semiconductor monitoring output
- With pluggable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width 45 mm

## Device and Function Description

### Overview on terminals and their function

#### Supply voltage A1, A2

Terminal for power supply to the device (see technical data).

#### Measuring inputs U1, U2, GND, E1, E2, and RJ45

The terminals E1 and E2 are provided for NPN or PNP proximity sensors (special version with NAMUR sensors). The switches are supplied with 24VDC (special version NAMUR U1, U2 = 8.2VDC) via the terminals U1, U2 and GND. The type of sensor (NPN or PNP) is to be selected in the menu.

The RJ45 interface is suited for the connection of encoders with sin/cos, TTL and HTL signals.

#### Output circuits (contacts) 13/14, 23/24, 43/44, 53/54

The device has two output circuits that are equipped with each two safety relays (standstill K1, K2; speed range (window) K3, K4) with forcibly guided contacts connected in series.

- Automatic mode: Monitoring of automatic rotational speed window and standstill speed.
- Setup mode: Monitoring of setup rotational speed window. Standstill is permanently enabled.

#### Signalling outputs 38 und 68

The non safety semiconductor signalling outputs 38 and 68 are designed for connection to a PLC, for example. They work as follows:

The terminal 38 outputs the internal supply potential ( $U_{\text{Rel}}$  approx. 24 V) when the rotational speed drops under the set standstill speed ( $n < n_{\text{Still}}$ ), i.e. a standstill is detected.

The terminal 68 outputs the internal supply potential ( $U_{\text{Rel}}$  approx. 24 V) when the rotational speed is within the set speed limits of the setup or automatic mode ( $n_{\text{min}} < n < n_{\text{max}}$ ).

If the release monitoring time is exceeded for RF1, a flash code signal is shown on monitoring output 68 with an ON/OFF ratio of 50/50.

Variant /101: The semiconductor outputs are not switching synchronous to the relay outputs. The semiconductor outputs give out the incoming signal

## Connection Terminals

Terminal designation	Signal description
A1 (+)	+ / L
A2	- / N
U1, U2	+ supply for proximity sensors or NAMUR-sensors
GND	- supply for proximity sensors
E1, E2	Input for pulse signal from proximity sensors or NAMUR-sensors
13, 14, 23, 24, 43, 44, 53, 54	Forcibly guided NO contacts for release circuit
38, 68	Semiconductor-monitoring output
T1, T2, T3, T4	Control output
ST, MAG, RF1, RF2, P1, P2, EA1, EA2	Control input

## Application

This device is designed for machinery and installations where hazards to people and property may be caused by the movement of machines or parts. The device permanently monitors for standstill (output circuit 13/14, 23/24) and rotational speed (output circuit 43/44, 53/54). For the rotational speed monitoring, it is possible to choose between automatic and setup mode. If properly connected, the UH5947 can be used to implement the safety functions STO (safe torque off), SOS (safe operation stop), SLS (safely limited speed), SSM (safe speed monitoring), SSR (safe speed range), as well as SDL (safe door locking) as per standard EN 61800-5-2.

## Functions

The device can be configured from the display and keys on the front plate or via RJ45 using a suited connection cable (see accessories) by means of the copy function.

Following measuring sensors can be used to sense the rotational speed:

- Two NPN or PNP proximity sensors (special version with NAMUR sensors) connected to the inputs E1 and E2. The proximity sensors (NAMUR sensors) are supplied with 24VDC from the speed relay to the terminal U1 and U2 (special version NAMUR 8.2V DC).
- Encoders (sin/cos, TTL, HTL) connected to the RJ45 interface via cable adapter (optionally available). The powersupply for the encoder is not provided by the speed monitor. Feedback influences should not occur.
- Combination from encoder and one proximity or NAMUR sensor for special version.

## Device and Function Description

of E1 with a ratio 1:2 if sensor selection is E1+E2. If E1+E2 is not chosen in sensor selection, the semiconductor outputs have no function.

Variant /200: the transistor outputs are not connected to the relay status. They are continuously on when the unit is on operation and are switched off as soon as a failure is detected.

### Test signals T1, T2, T3, T4

To detect errors in the input circuitry or while the safety-related inputs ST, RF1, RF2, EA1, EA2, P1, P2, and MAG are processed, a dynamic output signal is routed via the switching elements and via the start and feedback circuits. To this end, the output signals on the individual outputs T1, T2, T3 and T4 are different allowing to detect cross faults between the output signals.

### Signal input ST (start circuit)

The start signal is applied to this input. ST is supplied from the test signal T4. To start the movement connected to 23/24 and the monitoring the ON/OFF pushbutton has to be pressed for manual starting. This pushbutton is monitored for cross fault and short circuit by requiring a falling edge for starting. Therefore, it may not be pressed for more than 3 sec. When a cross fault or short circuit is detected the device changes to the safe condition and a diagnostic alarm is displayed. Once the fault is eliminated, a reset (see fault handling) or a restart by switching off and back on the supply voltage is required. For automatic starting, the test signal T4 must be present on ST via a jumper to start the device.

### Signal input MAG (interlocking of the safety gate)

MAG is supplied from the test signal T4. To start the dangerous movement (output 43/44, 53/54) the safety gate must be locked. The locking magnet has a contact that is read from the device via the MAG terminal. When this contact is not closed the device cannot be started or immediately changes to a safe condition (output contact 43/44, 53/54 drops out). However, when the contact is closed again the device can be started again. It is not needed to acknowledge the alarm.

At automatic mode the contact is permanently monitored. When it is not used the terminals T4 and MAG must be bridged.

In setup mode the signal input MAG is not monitored.

### Signal input RF1 (feedback circuit for setup or automatic mode)

RF1 is supplied from the test signal T3. The terminal RF1 is used to read the NC contacts of the external contactors that are connected to the terminal 44, 54. Switching through of the output contact 43/44, 53/54 is only possible when the feedback contacts are closed. When the output contacts 43/44, 53/54 are switched off, the feedback contacts must be closed within the monitoring time  $t_f$ . If not a failure message is displayed (see section time functions).

If no contact extension or reinforcement is used, the terminals T3 and RF1 must be bridged.

### Signal input RF2 (feedback circuit for standstill)

RF2 is supplied from the test signal T3. The terminal RF2 is used to read the NC contacts of the external contactors that are connected to the terminal 14, 24. Switching through of the output contact 13/14, 23/24 is only possible when the feedback contacts are closed. When the output contact 13/14, 23/24 is opened the feedback contacts need to be closed again after 1 second, otherwise a diagnostic alarm appears. Once the fault is eliminated, a reset (see fault handling) or a restart by switching off and back on the supply voltage is required.

If no contact extension or reinforcement is used, the terminals T3 and RF2 must be bridged.

### Signal inputs P1 and P2 (position switches for safety gate)

P1 is supplied from the test signal T1 and P2 from the test signal T2. These terminals are used to connect the position switches for the safety gate with tumbler mechanism. To achieve the highest possible categories (Performance Level e as per DIN EN ISO 13849-1 and SIL3 as per IEC EN 61508) the position switches are connected via two channels. The position switches are monitored for simultaneity. When the position switches are opened the contacts P1 and P2 must be opened within  $t < 1.0$  sec. A diagnostic alarm appears on the display when the simultaneity is not met. Once the fault is eliminated, a reset (see fault handling) or a restart by switching off and back on the supply voltage is required. To start the output contact 43/44, 53/54 both position switches must be closed at automatic mode.

## Device and Function Description

When the connection is only single-channel or two separate single-channel position switches are connected for a lower category the detection of simultaneity has to be disabled in the menu. When using a single-channel position switch the terminals T2 and P2 have to be bridged.

If none of the position switches are used, the terminals T1 and P1 and the terminals T2 and P2 have to be bridged.  
In setup mode the signal inputs P1 and P2 are not monitored.

### Signal inputs EA1 and EA2 (operating mode selection)

This speed monitor is suited for monitoring 2 different operating modes (setup and automatic mode). The speed limits for each operating mode are set in the menu using the keys. A safety-related two-channel antivalent switch connected to the terminals EA1 and EA2 is used to select the operating mode and thus the speed to be monitored.

Monitoring of the setup speed is selected when EA1 is connected to T1 via the antivalent selector switch and EA2 is disconnected from T2 by the antivalent switch. To monitor the automatic speed EA1 must be disconnected from T1 by the antivalent switch and EA2 must be connected to T2 via the antivalent selector switch. Both channels of the switch are monitored for simultaneity ( $t_{diff} < 1.0$  s). When the simultaneity is not fulfilled or a cross fault between EA1 and EA2 is present the device changes to a safe failure condition. Once the fault is eliminated, a reset (see fault handling) or a restart by switching off and back on the supply voltage is required. If no selection switch is connected to EA1 and EA2, wire links have to be installed according to the required function. (set up mode bridge EA1 to T1; automatic mode bridge EA2 to T2).

## Times

### Start-up delay time $t_a$

The start-up delay time is used to override the monitoring during the motor's start-up time until it has reached a certain rotational speed, for example. When the parameterized min. setup or automatic speed is not reached within the parameterized start-up delay time  $t_a$  the device immediately switches to a safe condition. The contacts 43/44, 53/54 are opened and the signalling output 68 is de-energized.

The start-up delay time is counted down whenever the device is restarted, a change from setup to automatic mode occurs in automatic start mode, or the ON/OFF pushbutton is pressed in manual start mode. However, the precondition before starting the start-up delay time is always that all safety requirements (position switch, magnet switch, feedback circuit) except of the speed are fulfilled. During this start-up delay time, the output contact 43/44, 53/54 is permanently switched through provided the safety requirements such as position and magnet switches remain fulfilled.

### Release delay time $t_r$

The release delay time is the time that is counted down until the output contacts 13/14, 23/24 and the signalling contact 15 are switched through after a detected standstill.

### Release monitoring time $t_f$

The release monitoring time is used to check the contactors connected to the output contacts 43/44, 53/54. When the feedback to RF1 is not present within the parameterized release monitoring time  $t_f$ , after release of the output 43/44, 53/54 a 50/50 flashing code is immediately issued from the signalling output 68. Additionally, an alarm is displayed.

Once the fault is eliminated, a reset (see fault handling) or a restart by switching off and back on the supply voltage is required.

## Device and Function Description

Response time up to the cut-out process after expiration of the set start-up delay time

The max. response time up to the detection of an underfrequency condition depends on the threshold to be checked. The max. response time up to the detection of an overfrequency condition depends on the present measuring signal. The lower the set threshold the more time needs the device to detect the failure. To achieve a quicker response time encoders or gearwheels may be used which deliver more pulses per revolution (e.g. encoders with line number 32). This reduces the time  $1/f_{\text{Threshold}}$  by the factor that equals to the encoder's number of lines or number of teeth.

General rule:  $t_{\text{response\_max}} = \frac{1}{f} + t_{\text{Reaktion}}$

Example: Underspeed to be monitored in setup mode 120 rpm = 2 Hz

With prox. sens.:  $t_{\text{response\_max}} = \frac{1}{2 \text{ Hz}} + 150 \text{ ms} = 650 \text{ ms}$   
(1 pulse/rev.)

With encoder with  
number of lines = 32:  $t_{\text{response\_max}} = \frac{1}{2 \text{ Hz} \times 32} + 150 \text{ ms} = 166 \text{ ms}$

$f$  = set frequency threshold or frequency of the  
present measuring signal  
(e.g. underfrequency in setup mode)

$t_{\text{response}}$  = internal response time after detection of  
cut-out frequency (max. 150 ms)

## Display

In normal operating mode, all settings can be checked at any time by pressing the UP or DOWN keys.

Additionally, the current speed from proximity sensor 1 or from the encoder is displayed. However, this speed does not correspond to the device's accuracy and is only designed for diagnostic purposes.

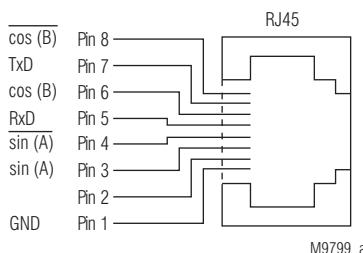

In the case of wiring errors and system failures corresponding diagnostic messages are displayed on the display unless they are deliberately disabled in the parameterization.

## Parameterization

### Parameterization and pin assignment of the RJ45 interface

When the UH 5947 is appropriately configured, the RJ45 interface is used to connect an encoder to the device. All 4 signal paths ( $A$ ,  $\bar{A}$ ,  $B$ ,  $\bar{B}$ ) and GND must be connected with the Encoder.

Moreover, this interface can be used to parameterize another device using an appropriate transfer cable OA 5947/100 (see accessories) and the copy function. This is useful when the speed monitor is to be used in a serial application or has to be replaced in case of failure.

### Parameterization using the display

See attached form page 57

## Change tracking

To detect non permitted changes of the settings, the menu item change tracking is available. This setting allows to activate a counter once, which is then incremented with each confirmed change of the settings. After activation of this function the user cannot reset the counter or disable this function again.

## Device and Function Description

The parameterization menu has follow structure: Illustration shows the factory setting <sup>2)</sup>

## Notes for Configuration

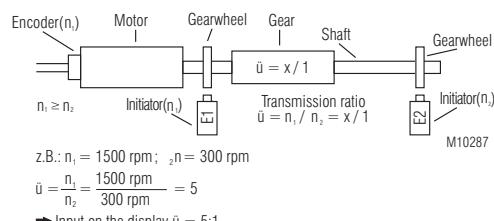

### Installing the measuring sensors

Cross faults between measuring sensors must be excluded by an appropriate cable installation.

### Gear ratio or shaft break monitoring

For certain applications, it may be necessary to set a gear ratio. To this end, the following arrangement of proximity sensors or encoder is required: It has to be taken into account that the rotational speed to be monitored on encoder or proximity sensor 1 (E1) must always larger than or equal to the rotational speed to be monitored on proximity sensor 2 (E2). The set speed limits on the display for a set gear ratio always refer to the encoder or proximity sensor 1 (E1).

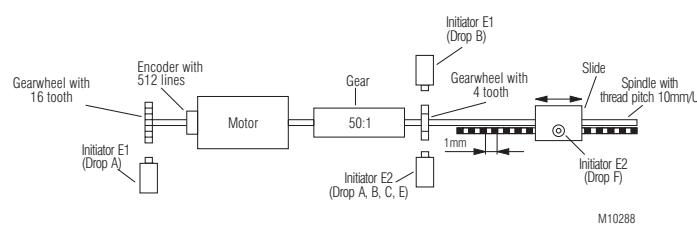

In the case that the gear arranged between E1 and E2 has no integer gear ratio, a corresponding adjustment is possible by a modification of the resolution settings for E1/E2 (pulses/rev. or mm).

This arrangement is also used to detect a shaft break. Taking the gear ratio into account, when the measured signals between sensor on the motor and sensor on the shaft do not correspond, the device immediately switches to a safe failure condition.

## Configuration Examples

### Monitored movement: rotational; sensor type: rotationally

Settings on the display based on the above example:

#### Case A:

Sensor selection: E1+E2

Proximity sensor resolution E1: 16 pulses/rev.

Proximity sensor resolution E2: 4 pulses/rev.

Gear ratio: 50:1

The speed limits (rpm) to be set refer to the rotational speed on proximity sensor E1.

#### Case B:

Sensor selection: E1+E2

Proximity sensor resolution E1: 4 pulses/rev.

Proximity sensor resolution E2: 4 pulses/rev.

Gear ratio: 1:1 (as measuring is on the same location)

The speed limits (rpm) to be set refer to the rotational speed on proximity sensor E1.

#### Case C:

Sensor selection: Encoder+E2

Encoder resolution: 512 pulses/rev.

Proximity sensor resolution E2: 4 pulses/rev.

Gear ratio: 50:1

The speed limits (rpm) to be set refer to the rotational speed on the encoder.

#### Case D:

Sensor selection: Encoder

Encoder resolution: 512 pulses/rev.

Gear ratio: Not relevant as only one sensor is selected.

The speed limits (rpm) to be set refer to the rotational speed on the encoder.

#### Case E: Monitoring of the cradle for 3m/min, for example

Sensor selection: Encoder+E2

Encoder resolution: 512 pulses/rev.

Proximity sensor resolution E2: 4 pulses/rev.

Gear ratio: 50:1

The rotational speed limits (rpm) to be set refer to the rotational speed on the encoder. Therefore, to monitor the cradle as shown, at first the translational movement has to be converted in a corresponding rotational movement. This is done as follows:

$$\begin{aligned} \text{Rotational monitoring limit} &= \frac{\text{Translational monitoring limit} \times \text{gear ratio}}{\text{Pitch}} \\ &= \frac{3 \text{ m/min} \times 50}{10 \text{ mm/U}} = 15000 \text{ U/min} \end{aligned}$$

#### Case F: Monitoring of the cradle for 3m/min, for example

Sensor selection: Encoder+E2

Encoder resolution: 512 pulses/rev.

Proximity sensor resolution E2: 10 pulses/rev. (1 mm/pulse)

Gear ratio: 50:1

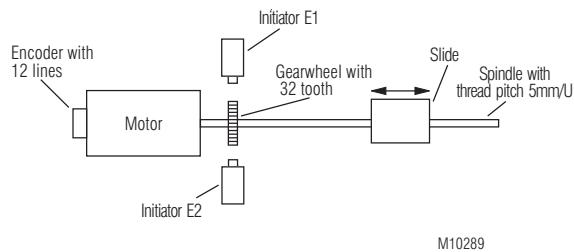

The rotational speed limits (rpm) to be set refer to the rotational speed on the encoder. Therefore, to monitor the cradle as shown, at first the translational movement has to be converted in a corresponding rotational movement. The resolution of the proximity sensor E2 has to be calculated too. This is done as follows:

$$\begin{aligned} \text{Rotational prox. sens resolution E2} &= \frac{\text{Pitch}}{\text{Translational proximity sensor resolution E2}} \\ &= \frac{10 \text{ mm/U}}{1 \text{ mm/Imp.}} = 10 \text{ Imp./U} \end{aligned}$$

$$\begin{aligned} \text{Rotational monitoring limit} &= \frac{\text{Translational monitoring limit} \times \text{gear ratio}}{\text{Pitch}} \\ &= \frac{3 \text{ m/min} \times 50}{10 \text{ mm/U}} = 15000 \text{ U/min} \end{aligned}$$

## Configuration Examples

### Monitored movement: translational; sensor type: rotationally

Settings on the display based on the above example:

#### Case A:

Sensor selection: E1+E2  
Proximity sensor resolution E1: 32 pulses/rev.  
Proximity sensor resolution E2: 32 pulses/rev.  
Pitch: 5 mm/rev.

The speed limits (m/min) to be set refer to the rotational speed on proximity sensor E1.

#### Case B:

Sensor selection: Encoder+E2  
Encoder resolution: 12 pulses/rev.  
Proximity sensor resolution E2: 32 pulses/rev.  
Pitch: 5 mm/rev.

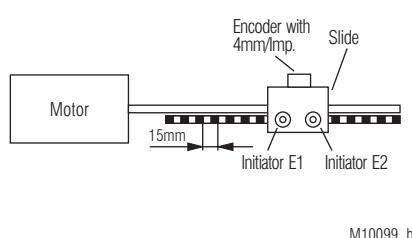

The speed limits (m/min) to be set refer to the rotational speed on the encoder.

#### Case C:

Sensor selection: Encoder  
Encoder resolution: 12 pulses/rev.  
Pitch: 5 mm/rev.

The speed limits (m/min) to be set refer to the rotational speed on the encoder.

### Monitored movement: translational; sensor type: linear

Settings on the display based on the above example:

#### Case A:

Sensor selection: E1+E2  
Proximity sensor resolution E1: 15 mm/pulse  
Proximity sensor resolution E2: 15 mm/pulse  
The speed limits (m/min) to be set refer to the frequency on proximity sensor E1.

#### Case B:

Sensor selection: Encoder+E2  
Encoder resolution: 4 mm/pulse  
Proximity sensor resolution E2: 15 mm/pulse  
The speed limits (m/min) to be set refer to the frequency on the encoder.

#### Case C:

Sensor selection: Encoder  
Encoder resolution: 4 mm/pulse  
The speed limits (m/min) to be set refer to the frequency on the encoder.

## Technical Data

### Input

**Nominal voltage  $U_N$ :** AC/DC 110 ... 240 V, DC 24 V

### Voltage tolerance

AC/DC: 0.8 ... 1.2  $U_N$

DC: 0.9 ... 1.1  $U_N$

**Nominal frequency (AC):** 50 / 60 Hz

**Frequency range (AC):** 45 ... 65 Hz

**max. residual ripple (DC):** 48 %

### Nominal consumption

AC/DC: < 6.5 W

DC: < 5 W

**Min. Off-time:** 150 ms

**Measuring accuracy:** ± 2 %

**Hysteresis:** 6.25 %

### Initiators

**Input current:** DC 24 V (provided by the device)

**Output:** as option PNP or NPN

**Voltage on E1 and E2:** min. DC 10 V

**Min. pulse duration e. g.**

**on and off time:** 75 µs

**Setting range:** 1 Hz ... 2 kHz

### Encoder

**Version:** with 2 signal paths (A, B) and their inverted signals ( $\bar{A}$ ,  $\bar{B}$ )

**Output:** as option TTL, HTL or sin/cos ( $U_A = 1 V_{PP}$ )  
When RJ45: Encoder is selected in setup routine under item 1.3 (sensor selection) a defined failure behaviour is necessary (high resistive outputs) in the case of missing powersupply or internal encoder failure. A forced dynamisation ( $t < 24$  h) is necessary during longer standstill periods.

**Setting range:** 1 Hz ... 400 kHz

### Special Version NAMUR

**Supply voltage:** DC 8.2 V (provided by the device)  
**Input current:** max. 10 mA

### Response value

Low: typ. 1.6 mA

High: typ. 1.8 mA

Broken wire: ≤ 0,15 mA

Short circuit: > 6,0 mA

**Min. pulse duration e. g.**

**on and off time:** 75 µs

**Setting range:** 1 Hz ... 2 kHz

### Output

**Contacts** 2 safe relay groups with each 2 NO contacts in series

**Contact:** Relay positive guide

**Thermal current  $I_{th}$ :** max. 5 A (see quadratic total current limit curve)

### Switching capacity

to AC 15 3 A / AC 230 V IEC/EN 60 947-5-1

NO contact: to DC 13 1 A / DC 24 V IEC/EN 60 947-5-1

NO contact: to DC 13 4 A / 24 V at 0.1 Hz

NO contact: 4 A gL IEC EN 60 947-5-1

**Electrical life** at 5 A, AC 230 V cos  $\varphi = 1$ :  $\geq 1 \times 10^6$  switching cycles IEC/EN 60 947-5-1

**Short circuit strength**  $\geq 50 \times 10^6$  switching cycles IEC EN 60 947-5-1

**max. fuse rating:** 4 A gL IEC EN 60 947-5-1

**Mechanical life:**  $\geq 50 \times 10^6$  switching cycles

**Semiconductor monitoring output:** 2 piece; 20 mA DC 24 V, plus switching

## EAC-Data

**Nominal voltage U<sub>N</sub>:** DC 24V

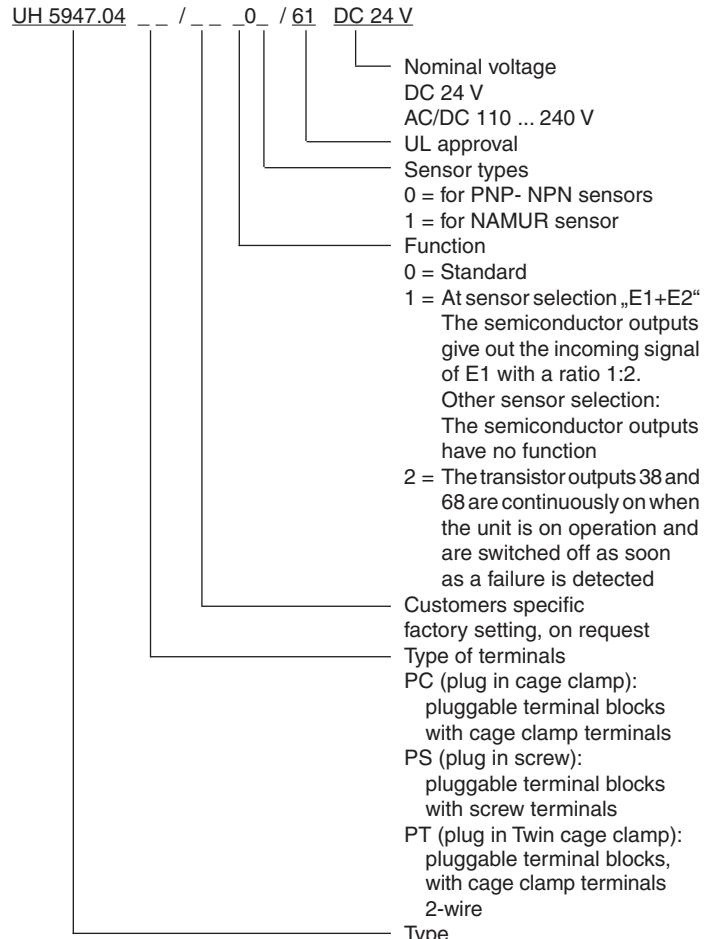

Technical data that is not stated in the UL-Data, can be found in the technical data section.

### Standard Type

UH 5947.04PS/61	DC 24 V
Article number:	0063476
• Safety output:	2 NO contacts for standstill monitoring
• Nominal voltage U <sub>N</sub> :	2 NO contacts for monitoring of speed range (window)
• Width:	DC 24 V 45 mm

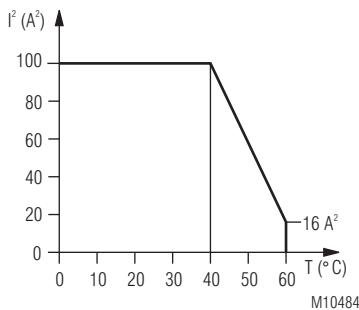

### Variants

## Accessories

- OA5947/100: Connection cable for copy function and adaptor
- KY5947 H1/S1: 15 pole adaptor to connect an encoder or for controllers of Siemens /Heidenhain with corresponding PIN arrangement (see remarks for accessories in operating manual)
- KY5947 H2/S4: 25 pole adaptor to connect an encoder or for controllers of Siemens /Heidenhain with corresponding PIN arrangement (see remarks for accessories in operating manual)

## Characteristics

Max. zulässiger Strom bei 60°C über 4 Kontakteichen = 2A  $\leq 4 \times 2^2 A^2 = 16 A^2$

$$I^2 = I_1^2 + I_2^2 + I_3^2 + I_4^2$$

$I_1, I_2, I_3, I_4$  - Strom in den Kontaktfeldern

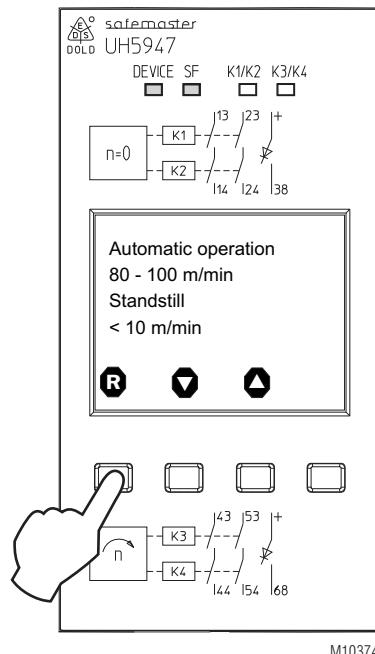

quadratic total current limit curve

## Troubleshooting

Failure	Potential cause
LED "SF" ON	- external failure (detailed description on display)
LED "Device" ON red	- Device failure (if the failure still exists after restart, replace device)
LED "Device" flashes red	- Parameter failure (min. one adjusted frequency to be monitored is out of range)

## Fault Handling

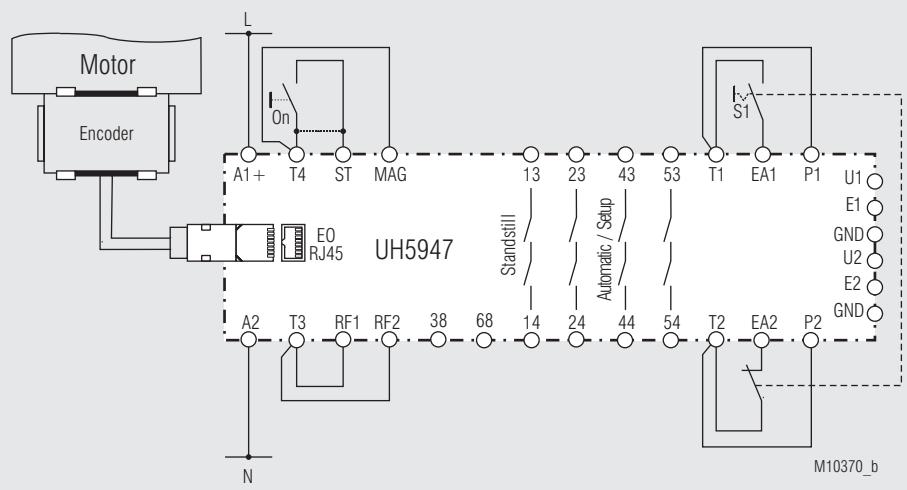

When faults are detected on or in the device they are indicated on the display by an appropriate message. If a reset of the device is necessary due to the fault, at first the alarm and the associated diagnostic message have to be acknowledged. Then, the left key has to be pressed for approx. 3 sec. to initiate a reset of the device.

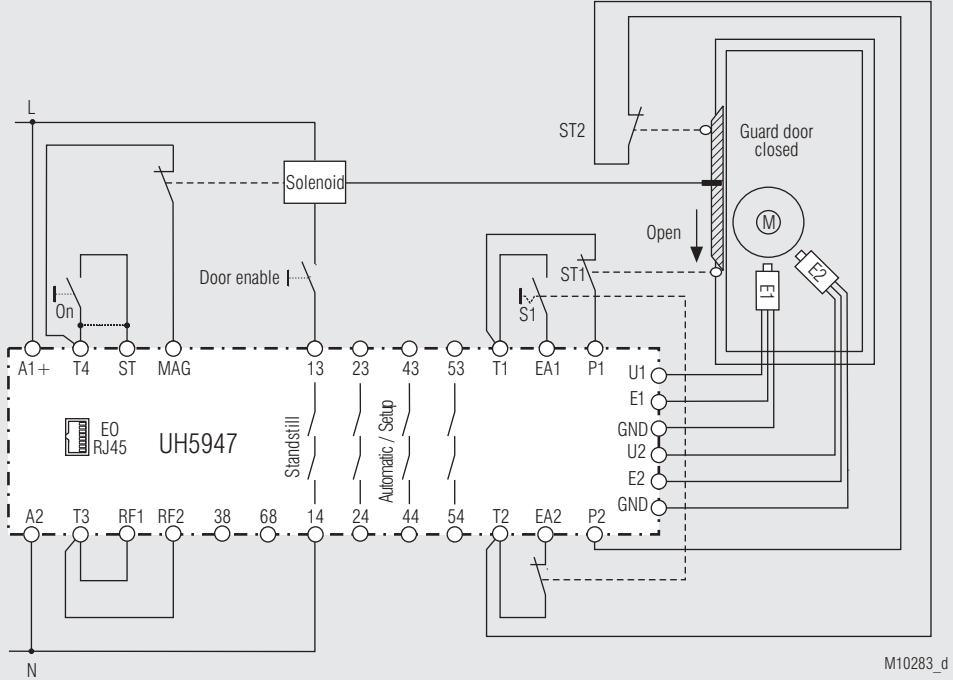

If a system failure is detected again after restart the device must be replaced and sent back to manufacturer.

## Maintenance and Repairs

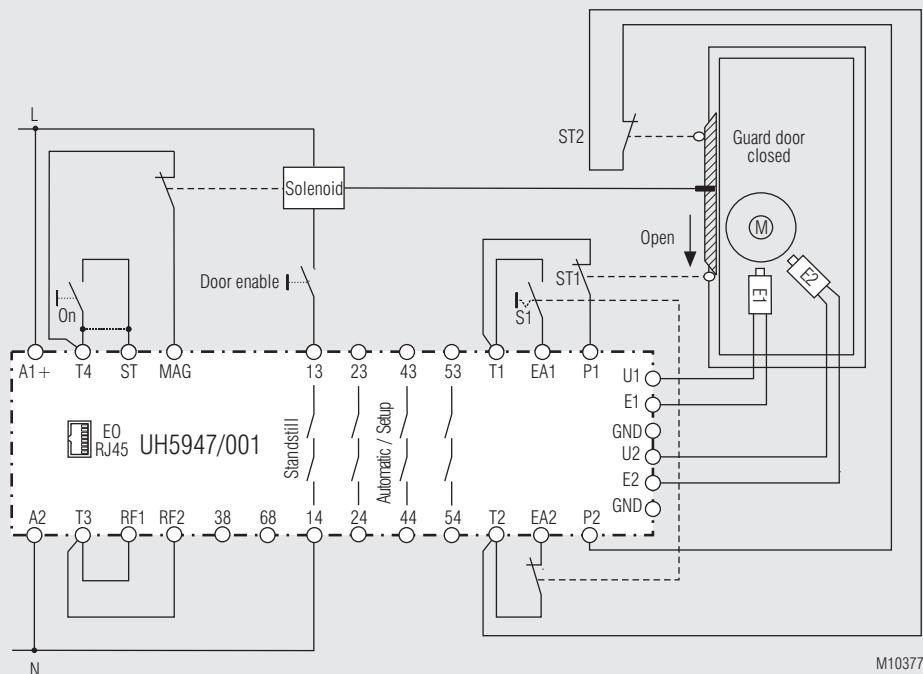

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

Rotational speed and standstill monitoring with suitable encoder, automatic mode; for manual start: ON/OFF pushbutton to T4/ST; for automatic start: jumper to T4/ST; suited up to SIL3, Performance Level e, Cat. 4 (Requirement for Cat. 4 is, that during longer periods of standstill a forced dynamisation ( $t < 24$  h) has to be carried out).

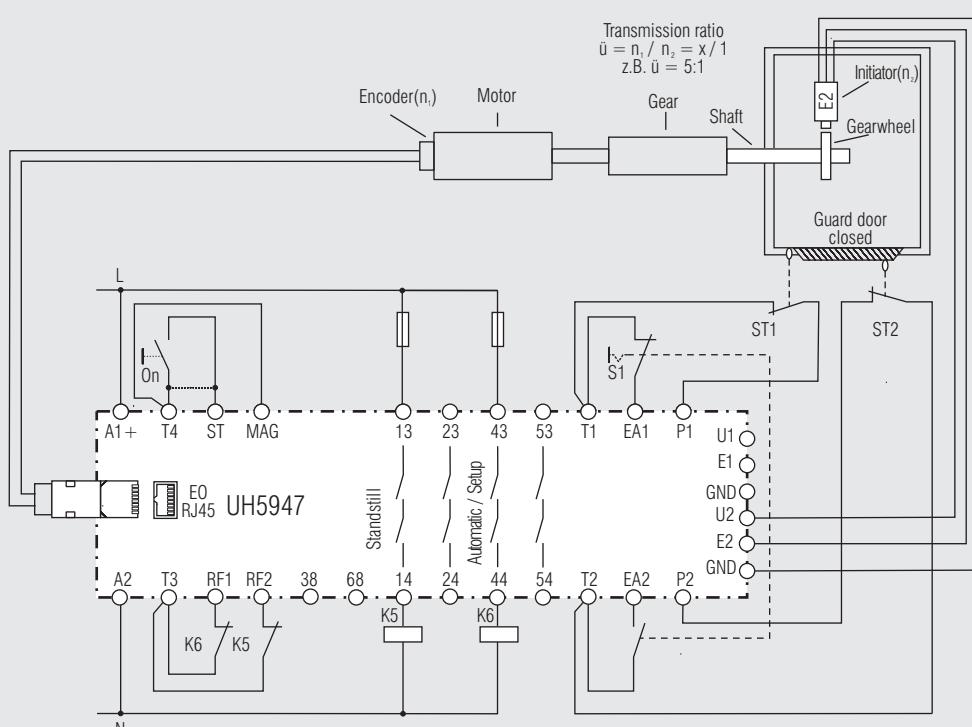

Two-channel rotational speed and standstill monitoring by means of two NPN or PNP proximity sensors; automatic mode; safety gate monitoring active; for manual start: ON/OFF pushbutton to T4/ST; for automatic start: jumper to T4/ST; suited up to SIL3, Performance Level e Cat. 4 (Requirement for Cat. 4 is, that during longer periods of standstill a forced dynamisation ( $t < 24$  h) has to be carried out).

M10377\_b

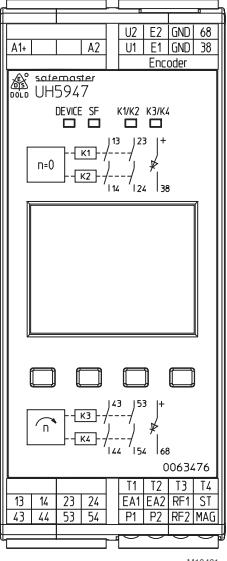

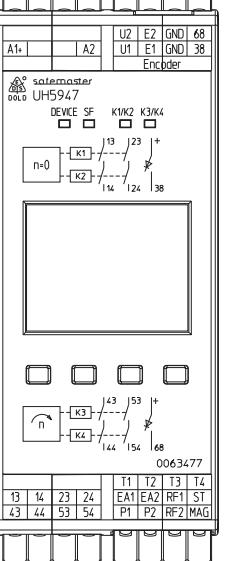

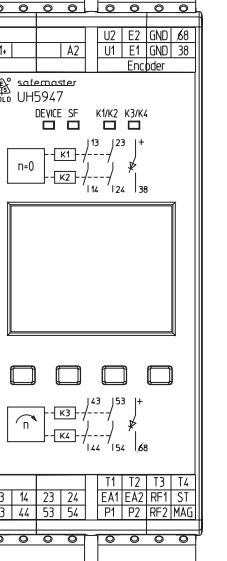

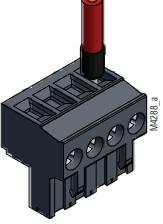

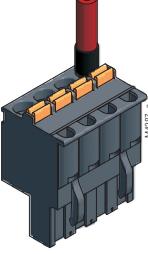

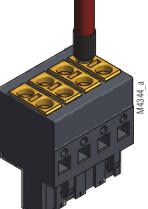

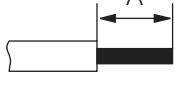

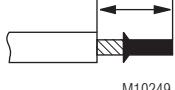

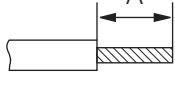

Rotational speed and standstill monitoring by means of encoder and two NAMUR-sensor; automatic mode; safety gate monitoring active; for manual start: ON/OFF pushbutton to T4/ST; for automatic start: jumper to T4/ST; suited up to SIL3, Performance Level e; Cat. 4

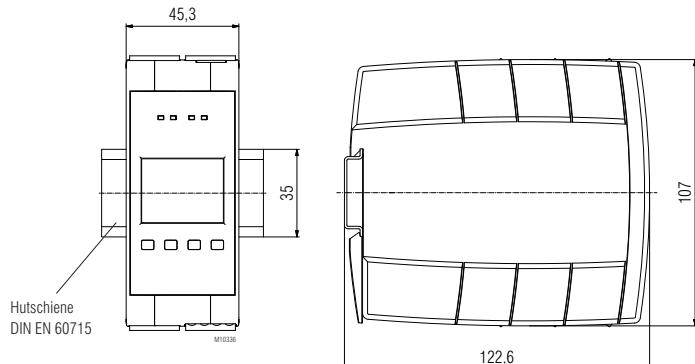

M10379\_c

Rotational speed and standstill monitoring by means of encoder and one NPN or PNP proximity sensor; setup mode; gear ratio set; safety gate monitoring active; for manual start: ON/OFF pushbutton to T4/ST; for automatic start: jumper to T4/ST; suited up to SIL3, Performance Level e, Cat. 4 (Requirement for Cat. 4 is, that during longer periods of standstill a forced dynamisation ( $t < 24$  h) has to be carried out).

# Safety Technique

**SAFEMASTER S**  
Speed monitor  
UH 6932

**DOLD** 

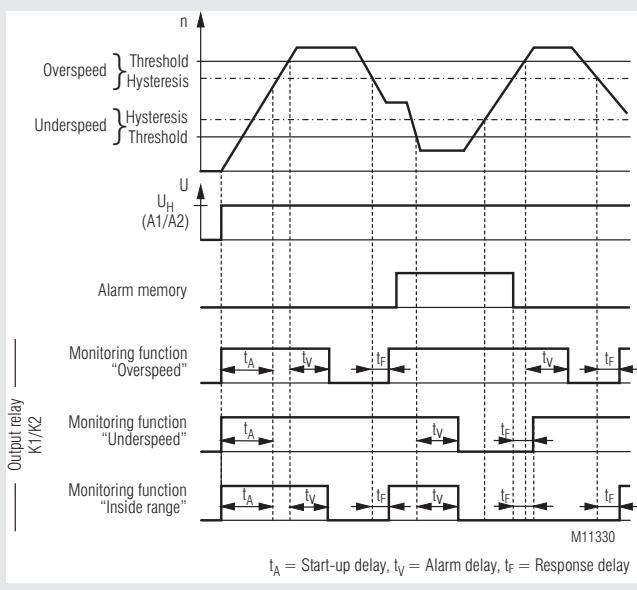

0273535

## Product Description

The speed monitor UH 6932 provides safe monitoring of motors and rotating equipment. It is used in machines and plants where machine movements or moving parts can be a danger to men and machine. Using the front side display the parameters can be easily and comfortably adapted to the individual application or changed when necessary.

## Function Diagram

## Your Advantage

- For safety applications up to PL e / Cat. 4 and SIL 3
- Simple and time saving setup without PC
- Comfortable, menu guided configuration via frontside display
- Reducing interruption time in production by extensive diagnostic functions
- Easy to integrate in existing drive applications
- Possible languages: english, german, french

## Features

### • According to

- Performance Level (PL) e und category 4 to EN ISO 13849-1
- SIL-Claimed Level (SIL CL) 3 to IEC/EN 62061
- Safety Integrity Level (SIL 3) to IEC/EN 61508
- Safety Integrity Level (SIL) 3 to IEC/EN 61511

- Overspeed, underspeed or window monitoring
- Integrated user friendly frontside display
  - Comfortable, menu guided configuration
  - For set point and actual value of Hz
- Fast reaction time by measuring duration of cycle of input frequency
- For PNP- or NPN-sensors
- Adjustable hysteresis
- Adjustable reset delay function from 0 ... 100 s
- Adjustable start up time delay from 0 ... 100 s
- Adjustable alarm delay from 0.1 ... 100 s
- Manual or auto-reset
- 2-channel function
- Forcibly guided output contacts
- LED-indicators and 2 semiconductor monitoring output
- Width 45 mm
- With pluggable terminal blocks for easy exchange of devices
- Variant /\_1:
  - it is possible to set a variety of response parameters by means of a 4 bit selection facility from an overriding control unit;
  - analog output (2 V to 10 V) corresponding to the current speed;
  - the possibility of overriding the speed by a supervisory function (muting);
  - adjustable switchover time from 0 ... 100 s

## Approvals and Markings

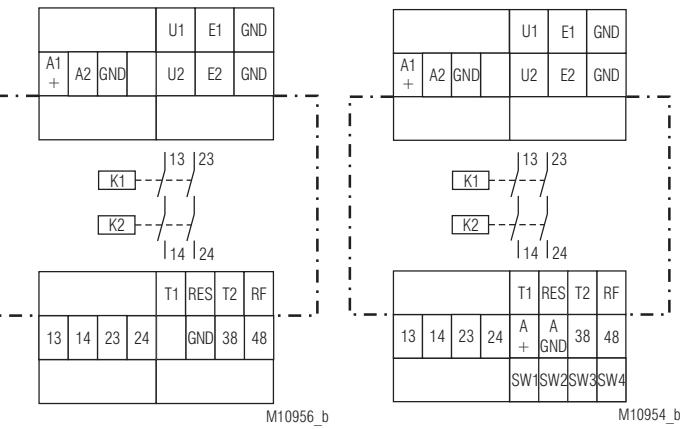

## Application

This device is designed for machinery and installations where hazards to people and property may be caused by the movement of machines or parts.

With correct connection it is possible to realise with the UH 6932 the safety functions STO (Safe Torque Off), SOS (Safe Operating Stop), SLS (Safely Limited Speed), SSM (Safe Speed Monitor) and SSR (Safe Speed Range) according to EN 61800-5-2. The actual realisation of the safety functions has to be validated in each application of the product for safety aspects.

## Circuit Diagrams

UH 6932

UH 6932/\_1

## Functions

In the „external window function mode“, the monitoring function acts inversely to the „internal window function“. Should the manual reset function be activated, then the output relay continues to remain in the alarm setting when the speed return to the pre-set permitted range. A resetting of the saved parameter is possible when the reset input is activated or the auxiliary voltage is shutdown.

When a start-up delay time ( $t_A$ ) is set, then the set start-up delay time will initially expire as soon as the auxiliary voltage of the equipment is switched-on and the ‘RF’ feedback circuit is closed. The start-up delay time will also expire after a reset of the manual reset mode. During this time period, a speed evaluation is disabled and the output relays remain at the pre-set permitted setting. The start-up delay function can, for example override an alarm message during the start-up stage of a generator or electric motor. Should, after a reset (in the manual reset mode), the feedback circuit not be closed, then the equipment will go into a safe error state.

With correct connection it is possible to realise with the UH 6932 the safety functions STO (Safe Torque Off), SOS (Safe Operating Stop), SLS (Safely Limited Speed), SSM (Safe Speed Monitor) and SSR (Safe Speed Range) according to EN 61800-5-2. The actual realisation of the safety functions has to be validated in each application of the product for safety aspects.

## Connection Terminals

Terminal designation	Signal designation
A1+	DC24V
A2	0V
U1, U2	(+) supply for proximity sensors
E1, E2	measuring inputs for proximity sensors
GND	Reference potential for Semiconductor monitoring output and control outputs, as well as (-) supply for proximity sensors
13, 14, 23, 24	Forcibly guided NO contacts for release circuit
38, 48	Semiconductor-monitoring output
T1, T2	Control output
RES, RF, SW1, SW2, SW3, SW4	Control input
A +, A GND	Analogue output

## Functions

The auxiliary voltage is connected to terminals A1 to A2. The equipment can be configured via the display and the setting keys on the front plate. The detection of the speed is effected via two NPN- or PNP-proximity switches, which are connected up at the Inputs: E1 and E2. The electric power supply for the proximity switch is provided from the speed monitor of 24V DC at the Terminals: U1 and U2. For each initiator a separate wire has to be used and wired separately. The input speed are compared internally to the thresholds already set on the equipment. As the internally measures the time periods, the fastest possible speed detection monitoring is possible. Should the over-speed function be set, then the output relay will switch to the alarm mode, when the set response parameter is over-exceeded longer than the parameterized alarm-delay function ( $t_v$ ). Should the speed fall again below the response parameter, minus the set hysteresis, the output relay will be activated after the expiry of the reset-delay time period ( $t_F$ ) and return to its pre-set permitted supervisory state. As regards the under-speed function, the output relay will switch to the alarm mode, when the set response parameter is under-exceeded longer than the parameterized alarm-delay function ( $t_v$ ) time period. As soon as the speed return to the range governed by the response parameter, plus the set hysteresis, then the output relay will again return to the pre-set permitted state after the expiry of the reset-delay time period ( $t_F$ ). In the „internal window function mode“, the output relay will switch to the alarm setting when the speed exceed the pre-set permitted range of the response parameter. Once the speed again return within the range of both the upper- and lower response parameters, minus and/or plus the pre-set hysteresis values (upper response parameter minus- and/or the lower response parameter plus -the relative hysteresis values), then the output relay will again switch back to the pre-set permitted range after the expiry of the reset-delay time period ( $t_F$ ).

## Indicators

LED ON:	green green-flashing red-flashing	On, when supply connected Parameterization mode Parameterization error
LED K1/K2:	green yellow	Relay K1 and K2 energized Muting (Relay K1 and K2 energized)

DISPLAY:		Status indication Alarms / diagnostics Parameterization

## Device and function description

### Reset the manual reset, automatic reset function

In the manual reset function mode, a reset input is provided for acknowledging error messages (over-speed and under-speed). Should a 'T1' status engage the input for longer than 1 second, then a reset will be conducted in the equipment. A renewed reset is however possible if the reset signal at the reset input is briefly interrupted. In the automatic reset mode, the input will be ignored because the above mentioned error message will be automatically reset.

### Semiconductor outputs

The Semiconductor Output: 38 will indicate the status of the Relays: K1 / K2. When the relays are energized, then the Semiconductor Output: 38 is switched on. The Semiconductor Output: 48 will report errors within the equipment. Should an error actually exist, then the Semiconductor Output: 48 will be switched on.

The semiconductor outputs are not safety related. They can be used for monitoring purposes.

### Setting the speed thresholds

For the monitoring functions: „internal window monitoring function“ and in the „external window monitoring function“, a minimum difference between the lower- and the upper -threshold of 5% is to be anticipated at the upper speed threshold, in addition to the already set hysteresis parameter. This is internally verified during the setting of the speed threshold and an error message will be displayed in case of any erroneous setting and/or the setting will not be permitted by the display. The maximum settable lower speed threshold can be calculated as follows:

#### Monitoring function: „Internal window monitoring“:

Maximum lower threshold =

upper speed threshold - (5% + 2 x hysteresis) x upper speed threshold

Example:

Upper speed threshold 100 Hz, hysteresis 2%

Maximum lower speed threshold =

100 Hz - (0.05 + 2 x 0.02) x 100 Hz = 91 Hz

#### Monitoring function: „External window monitoring“:

Maximum speed threshold =

upper speed threshold - 5% x upper speed threshold

Example:

Upper speed threshold 100 Hz, any required hysteresis

maximum lower speed threshold =

100 Hz - 0.05 x 100 Hz = 95 Hz

### Feedback circuit

The feedback contacts of external contactors are monitored on terminal RF. The terminal RF gets the test signal from T2 via normally open contacts of the contactors which are connected to terminals 14 and 24. The normally closed contact have to be closed to start the device. If no contact extension or reinforcement is used, the terminals RF and T2 have to be bridged.

### Start up time delay $t_A$

The start-up delay time period expires when switching-on the auxiliary voltage of the equipment, once the 'RF' feedback circuit is closed. In addition, the start-up delay time period will also expire after a reset in the manual reset mode. During this time period, no speed evaluation is conducted. The LED 't' will flash and the output contacts: 13 to 14 and 23 to 24 will remain closed during this time period. As a result of the start-up delay time period, an alarm message can, for example be overridden during the start-up time period of a generator or electric motor. Should however, after a reset (in the manual reset mode), the feedback circuit not be closed, then the equipment will go into a safe error state.

### Alarm delay $t_v$

The alarm-delay time period will expire when the equipment has recognised, that the speed exceed the permitted range. Only after the expiry of the alarm-delay time period, will the output contacts :13 to 14 and 23 to 24 be switched off. When the speed again enter the permitted range during the alarm-delay time period, then the alarm-delay function is terminated. The LED 't' will flash during the time period.

## Device and function description

### Reset delay time $t_f$

The reset-delay time period represents the time during after which the output contacts: 13 to 14 and 23 to 24 are switched on (when the speed is within a permitted range). Should the speed again enter the alarm state during the runoff of the reset-delay time period (when the speed exceed the required range), the reset-delay time period will be terminated. The LED 't' will flash during the same time period.

The start-up delay time period will override the reset-delay time period, i.e. when the output contacts are on by the start-up delay mode, then the reset-delay time period will be overridden (output contacts: 13 to 14 and 23 to 24 are closed). Even after an expiry of the start-up delay time period, the reset-delay time period will not be initiated.

### Display

In normal operating mode, all settings can be checked at any time by pressing the UP or DOWN keys.

Additionally, the actual speed is displayed. However, this speed does not correspond to the device's accuracy and is only designed for diagnostic purposes.

In the case of wiring errors and system failures corresponding diagnostic messages are displayed on the display.

### Parameterization using the display

See attached form page 43

### Change tracking

To detect non permitted changes of the settings, the menu item change tracking is available. This setting allows to activate a counter once, which is then incremented with each confirmed change of the settings. After activation of this function the user cannot reset the counter or disable this function again.

### Only at variant /\_ \_ 1

### Digital selection via the software Inputs: SW1 to SW4

Four various speed modes with different response parameters, can be configured via the software Inputs: SW1 to SW4 (see Table). The electric power supply for the inputs should be between 10V DC and 26.4V DC to GND. A switchover configuration can also be undertaken during the operating mode. Should a speed mode be altered whilst operating, then the switchover time period ( $t_{v1}$ ) will commence, provided the output relays are switched on through the switchover, and the start-up delay time period has expired. During this time period, no speed evaluation will be conducted and the output relays remain energized (closed). Should during the switchover time period the speed modus again be altered, then the switchover time period will not again be initiated. After the expiry of the switchover time period, the monitoring function will be continued at the currently set speed mode). The switchover time period, for example can affect the overriding of an alarm message during the start-up stage- or the braking stage -of a generator or electric motor.

SW1	SW2	SW3	SW4	Mode
0	0	1	1	Frequency mode 1
0	1	1	0	Frequency mode 2
1	0	0	1	Frequency mode 3
1	1	0	0	Frequency mode 4

### Caution !

 Any continuously repeated switching over of the speed modus (always immediately after the expiry of the switchover time period) can lead to the situation, that the equipment starts to function similarly as in the 'Muting Mode' (i.e. the speed monitoring function is overridden and the output relays remain permanently on).

**Muting function**

The speed monitoring function can be overridden on the display and by an appropriate activation of the software Digital Inputs: SW1 to SW4. For this purpose, the muting function should be activated when parametering on the display. Once this function is activated, then it will continue to be possible to continue to switch over between the speed modulus: 1 to 3, as described above. Should a selection be made of the speed mode 4 (muting) via the 'SW' software inputs, then no further speed monitoring will be conducted. The output relays remain permanently on and the start-up delay function ( $t_A$ ), the switchover time period function ( $t_U$ ), the reset-delay function ( $t_F$ ) and the alarm-delay function ( $t_V$ ) will all be reset.

**Analogue output A+ and A GND**

The analogue output 2-10 V shows the actual measured frequency. The maximum value of the analogue output (10 V) is equal to the adjusted upper frequency threshold. The minimum value of the analogue output (2 V) is equal to the adjusted lower frequency threshold. The scaling is frequency linear.

In the monitoring function „underfrequency“ the maximum value of the analogue output is equal to the highest possible setting value of the device (2000 Hz).

In the monitoring function „overfrequency“ the minimum value of the analogue output is equal to 0 Hz.

If the muting function is selected, the maximum value of the analogue output is equal to the maximum setting value of the device (2000 Hz) and the minimum value is equal to 0 Hz.

In the case of a failure the analogue output goes to 0V.

The analogue output is not safety related. It can be used for diagnosis.

**Switchover time period  $t_U$** 

The switchover time period expires when the speed mode is altered during operations at the Software Inputs: SW1 to SW4, the output contacts are closed, no start-up delay function is running and the Switchover Time Period: 'tU' has not already been initiated and/or is running. During this time period, no speed monitoring is conducted and the output contacts remain on.

Ambient temperature 60°C, 8A:

min. 90°C aluminum or copper conductors

Technical data that is not stated in the UL-Data, can be found in the technical data section.

## Standard Type

UH 6932.02PS/61 DC 24 V

Article number:	0066816
• Output:	2 NO contacts
• Auxiliary voltage $U_H$ :	DC 24 V
• Width:	45 mm

## Ordering Example

UH 6932 .02 \_\_\_ / 0 \_\_\_ /61 DC 24 V

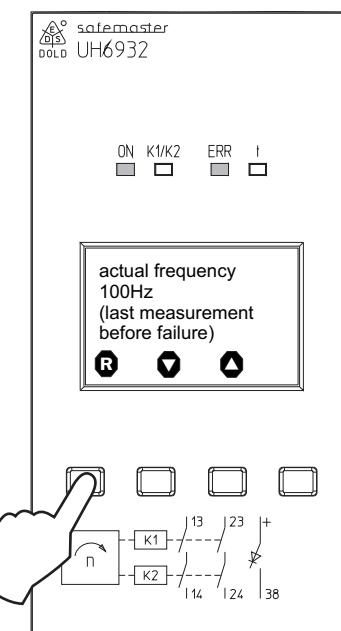

- Nominal voltage
- UL-approval
- 0 = Standard
- 1 = with different frequency mode and analogue output
- 0 = npn-input
- 1 = pnp-input
- Type of terminals PS (plug in screw): pluggable terminal blocks, with screw terminals
- Contacts
- Type

## Troubleshooting

Failure	Potential cause
LED „ON“ does not light up	- Power supply A1+/A2 not connected
LED „ON“ flashes red	- Parameterization error (detailed description on display)
LED „ERR“ flashes red	- External failure (detailed description on display)
LED „ERR“ continuously on	- Device failure (if the failure still exists after restart, replace device)

## Fault handling

When faults are detected on or in the device they are indicated on the display by an appropriate message. If a reset of the device is necessary due to the fault, at first the alarm and the associated diagnostic message have to be acknowledged. Then, the left key has to be pressed for approx. 3 sec. to initiate a reset of the device.

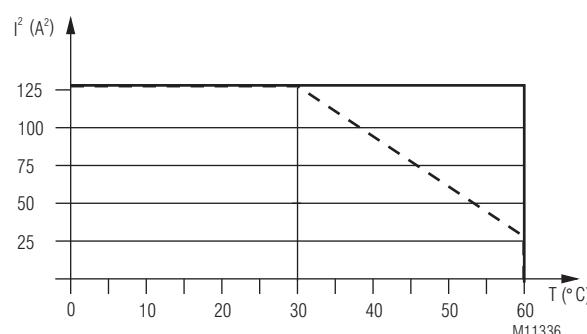

M11256

If a system failure is detected again after restart the device must be replaced and sent back to manufacturer.

## Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristic

device free-standing  
max. current at 60°C over  
2 contact path = 8A =  $\sqrt{2 \times 8^2 A^2} = 128 A^2$

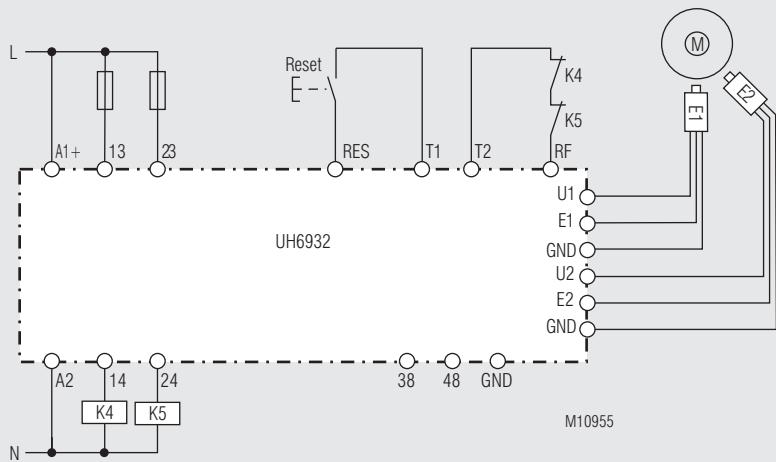

device mounted without distance heated by  
— — — devices with same load,  
max. current at 60°C over  
2 contact path = 4A =  $\sqrt{2 \times 4^2 A^2} = 32 A^2$

$$\sum I^2 = I_1^2 + I_2^2$$

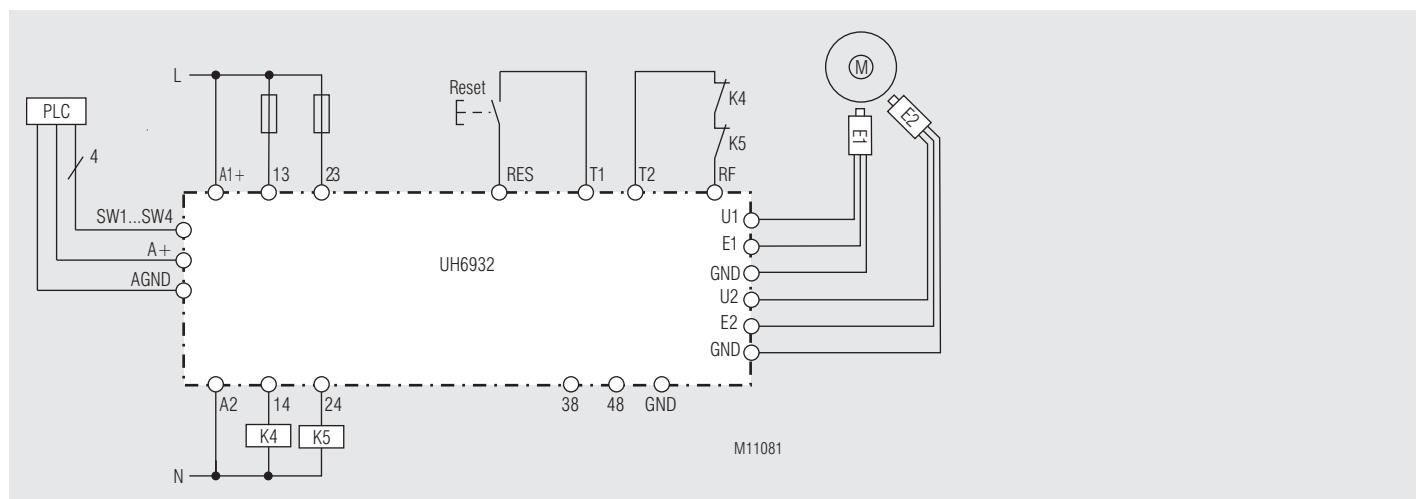

$I_1, I_2$  - current in contact paths

Quadratic total current limit curve

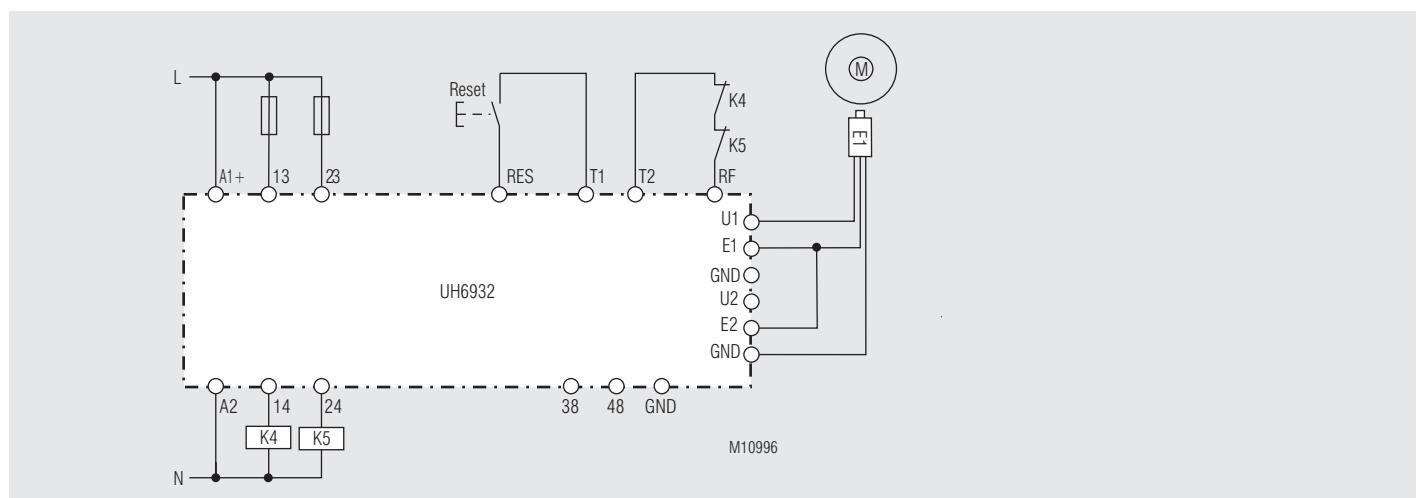

## Application Examples

Standard connection,  
Suited up to SIL3, Performance Level e, Cat. 4

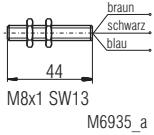

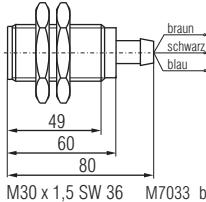

Standard connection with UH6932/\_1,  
Suited up to SIL3, Performance Level e, Cat. 4

Connection with a proximity sensor,  
Suited up to SIL 2, Performance Level c, Cat. 2  
(to achieve Cat. 2 the safety function has to be tested on a regular base)

## SAFEMASTER S Frequency Monitor UH 6937

DOLD 

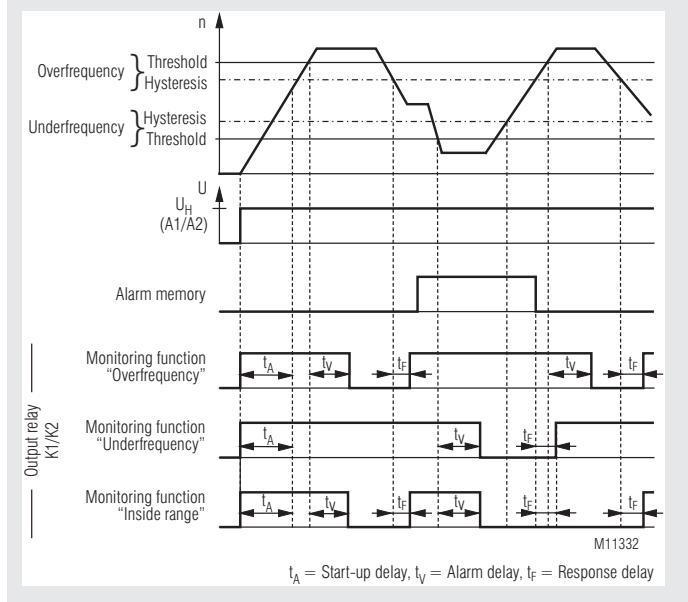

0273539

### Product Description

The frequency monitor UH 6937 provides safe frequency monitoring of AC voltages. It is used to monitor the output frequency of inverters or the rotor frequency of slipring motors. An other application area is the monitoring of motors in crane plants. Using the front side display the parameters can be easily and comfortably adapted to the individual application or changed when necessary.

### Function Diagram

### Your Advantage

- For safety applications up to PL e / Cat. 4 and SIL 3
- Simple and time saving setup without PC
- Comfortable, menu guided configuration via frontside display
- Reducing interruption time in production by extensive diagnostic functions
- Easy to integrate in existing drive applications
- For inverters up to 1200 Hz
- Possible languages: english, german, french

### Features

- According to
  - Performance Level (PL) e und category 4 to EN ISO 13849-1
  - SIL-Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL 3) to IEC/EN 61508
  - Safety Integrity Level (SIL 3) to IEC/EN 61511
- Over-, underfrequency or window monitoring of single or 3-phase in AC systems
- Integrated user friendly frontside display
  - Comfortable, menu guided configuration
  - For set point and actual value of Hz
- Fast reaction time by measuring duration of cycle of input frequency
- Universal measuring inputs for AC-voltages of 8 ... 280 V for single-phase monitoring as well as 16 ... 690 V for single- and 3-phase monitoring
- Suitable for inverters
  - Variant /0\_ \_ : 1 ... 700 Hz
  - Variant /1\_ \_ : 1 ... 1200 Hz
- Adjustable hysteresis
- Adjustable reset delay function from 0 ... 100 s
- Adjustable start up time delay from 0 ... 100 s
- Adjustable alarm delay from 0.1 ... 100 s
- Manual or auto-reset
- galvanic separation between measuring input, auxiliary voltage and output contacts
- 2-channel function
- Forcibly guided output contacts
- LED-indicators and 2 semiconductor monitoring output
- Width 45 mm
- With pluggable terminal blocks for easy exchange of devices
- Variant /\_ \_1:
  - it is possible to set a variety of response parameters by means of a 4 bit selection facility from an overriding control unit;
  - analog output (2V to 10V) corresponding to the current speed;
  - the possibility of overriding the speed by a supervisory function (muting);
  - adjustable switchover time from 0 ... 100 s

### Approvals and Markings

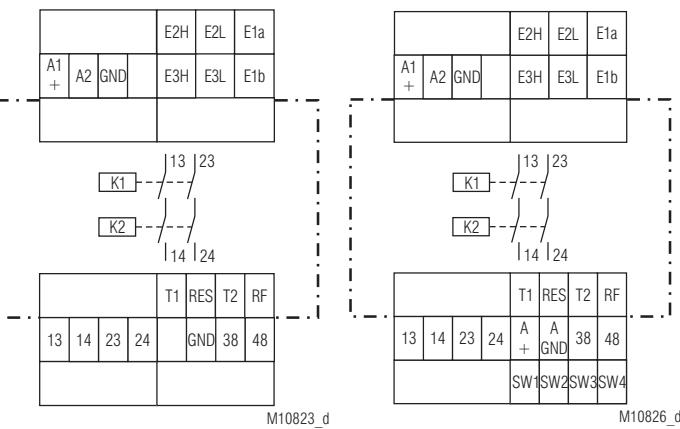

### Applications

Safe frequency monitoring of AC voltages

- Safe monitoring of the outputfrequency of inverters
- Safe monitoring of the rotorfrequency of slipring motors
- Safe control / monitoring of motorts in crane applications

With correct connection it is possible to realise with the UH 6937 the safety functions STO (Safe Torque Off), SOS (Safe Operating Stop), SLS (Safely Limited Speed), SSM (Safe Speed Monitor) and SSR (Safe Speed Range) according to EN 61800-5-2. The actual realisation of the safety functions has to be validated in each application of the product for safety aspects.

## Circuit Diagrams

UH6937

UH6937/\_/\_1

## Connection Terminals

Terminal designation	Signal designation
A1+	DC24V
A2	0V
E1a, E1b, E2L, E2H, E3L, E3H	Frequency measuring inputs
GND	Reference potential for semiconductor monitoring output and control outputs
13, 14, 23, 24	Forcibly guided NO contacts for release circuit
38, 48	Semiconductor-monitoring output
T1, T2	Control output
RES, RF, SW1, SW2, SW3, SW4	Control input
A +, A GND	Analogue output

## Functions

The auxiliary voltage is connected to terminals A1-A2. The equipment can be configured via the display and the setting keys on the front plate. Terminals E1a, E1b, E2L, E2H, E3L and E3H form the measuring input.

For low voltages the measuring voltage is connected to E1a-E2L and E1b-E3L and for higher voltages to E1a-E2H and E1b-E3H (see section technical data).

When monitoring single phase AC voltage, it is recommended to connect the terminals E1a-E2L or E1a-E2H directly to the inverter, the terminals E1b-E3L or E1b-E3H directly to the motor connection terminals. Separate wires in separate cables with space to each other have to be used for each of the frequency inputs. When monitoring 3-phase AC voltages it is recommended to wire these terminals directly to the motor connection terminals.

The input frequency is compared to the setting value. As the device measures the cycle duration the fastest frequency measurement is possible. Should the over-frequency function be set, then the output relay will switch to the alarm mode, when the set response parameter is over-exceeded longer than the parameterized alarm-delay function ( $t_A$ ). Should the frequency fall again below the response parameter, minus the set hysteresis, the output relay will be activated after the expiry of the reset-delay time period ( $t_F$ ) and return to its pre-set permitted supervisory state.

As regards the under-frequency function, the output relay will switch to the alarm mode, when the set response parameter is under-exceeded longer than the parameterized alarm-delay function ( $t_V$ ) time period. As soon as the frequency return to the range governed by the response parameter, plus the set hysteresis, then the output relay will again return to the pre-set permitted state after the expiry of the reset-delay time period ( $t_F$ ).

## Functions

In the „internal window function mode“, the output relay will switch to the alarm setting when the frequency exceed the pre-set permitted range of the response parameter. Once the frequency again return within the range of both the upper- and lower response parameters, minus and/or plus the pre-set hysteresis values (upper response parameter minus- and/or the lower response parameter plus -the relative hysteresis values), then the output relay will again switch back to the pre-set permitted range after the expiry of the reset-delay time period ( $t_F$ ).

In the „external window function mode“, the monitoring function acts inversely to the „internal window function“. Should the manual reset function be activated, then the output relay continues to remain in the alarm setting when the frequency return to the pre-set permitted range. A resetting of the saved parameter is possible when the reset input is activated or the auxiliary voltage is shutdown. When a start-up delay time period ( $t_A$ ) is set, then the set start-up delay time period will initially expire as soon as the auxiliary voltage of the equipment is switched-on and the ‘RF’ feedback circuit is closed. The start-up delay time period will also expire after a reset of the manual reset mode. During this time period, a frequency evaluation is disabled and the output relays remain at the pre-set permitted setting. The start-up delay function can, for example override an alarm message during the start-up stage of a generator or electric motor. Should, after a reset (in the manual reset mode), the feedback circuit not be closed, then the equipment will go into a safe error state.

With correct connection it is possible to realise with the UH 6937 the safety functions STO (Safe Torque Off), SOS (Safe Operating Stop), SLS (Safety Limited Speed), SSM (Safe Speed Monitor) and SSR (Safe Speed Range) according to EN 61800-5-2. The actual realisation of the safety functions has to be validated in each application of the product for safety aspects.

## Indicators

LED ON:	green	On, when supply connected
	green-flashing	Parameterization mode
	red-flashing	Parameterization error
LED K1/K2:	green	Relay K1 and K2 energized
	yellow	Muting (Relay K1 and K2 energized)
LED ERR:	red	Internal failure
	red-flashing	External failure
LED t:	green-flashing	(K1/K2; light up) Delay times runoff $t_A$ or $t_U$
	yellow-flashing	(K1/K2 does not light up) Delay times runoff $t_F$
	yellow-flashing	(K1/K2 light up) Delay times runoff $t_V$
DISPLAY:		Status indication Alarms / diagnostics Parameterization

## Notes

### Frequency measuring input

The measuring input is divided up into voltage ranges (AC 8 ... 280 V on E1a-E2L und E1b-E3L and AC 16...690 V on E1a-E2H and E1b-E3H). If the measuring voltage is always higher than AC 16 V, the higher range should be used. A special dimensioned measuring input with low pass characteristic avoids the measuring of the pulse frequency. In addition the input sensitivity is adapted to the voltage-/frequency-characteristic of inverters.

Please make sure that the frequency measuring inputs are connected to the same single or 3-phase voltage system.

### Manual reset, automatic reset

In the manual reset mode, a reset-input function is provided for acknowledging error messages (overfrequency and underfrequency). Should a 'T1' status engage the input for longer than 1 second, then a reset will be conducted in the equipment. A renewed reset is however possible if the reset signal at the reset input is briefly interrupted. In the automatic reset mode, the input will be ignored because the above mentioned error message will be automatically reset.

### Semiconductor outputs

The Semiconductor Output: 38 will indicate the status of the Relays: K1 / K2. When the relays are energized, then the Semiconductor Output: 38 is switched on. The Semiconductor Output: 48 will report errors within the equipment. Should an error actually exist, then the Semiconductor Output: 48 will be switched on.

The semiconductor outputs are not safety related. They can be used for monitoring purposes.

### Setting the frequency thresholds

For the monitoring functions: „internal window monitoring function“ and in the „external window monitoring function“, a minimum difference between the lower- and the upper -threshold of 5% is to be anticipated at the upper frequency threshold, in addition to the already set hysteresis parameter. This is internally verified during the setting of the speed threshold and an error message will be displayed in case of any erroneous setting and/or the setting will not be permitted by the display. The maximum settable lower frequency threshold can be calculated as follows:

#### Monitoring function: „Internal window monitoring“:

Maximum lower threshold =

upper frequency threshold - (5% + 2 x hysteresis) x upper frequency threshold

Example:

Upper frequency threshold 100 Hz, hysteresis 2 %

Maximum lower frequency threshold =

100 Hz - (0.05 + 2 x 0.02) x 100 Hz = 91 Hz

#### Monitoring function: „External window monitoring“:

Maximum frequency threshold =

upper frequency threshold - 5 % x upper frequency threshold

Example:

Upper frequency threshold 100 Hz, any required hysteresis

maximum lower frequency threshold =

100 Hz - 0.05 x 100 Hz = 95 Hz

### Feedback circuit

The feedback contacts of external contactors are monitored on terminal RF. The terminal RF gets the test signal from T2 via normally open contacts of the contactors which are connected to terminals 14 and 24. The normally closed contact have to be closed to start the device. If no contact extension or reinforcement is used, the terminals RF and T2 have to be bridged.

### Start up time delay $t_A$

The start-up delay time period expires when switching-on the auxiliary voltage of the equipment, once the 'RF' feedback circuit is closed. In addition, the start-up delay time period will also expire after a reset in the manual reset mode. During this time period, no frequency evaluation is conducted. The LED 't' will flash and the output contacts: 13 to 14 and 23 to 24 will remain closed during this time period. As a result of the start-up delay time period, an alarm message can, for example be overridden during the start-up time period of a generator or electric motor. Should however, after a reset (in the manual reset mode), the feedback circuit not be closed, then the equipment will go into a safe error state.

### Alarm delay $t_v$

The alarm-delay time period will expire when the equipment has recognised, that the frequency exceed the permitted range. Only after the expiry of the alarm-delay time period, will the output contacts :13 to 14 and 23 to 24 be switched off. When the frequency again enter the permitted range during the alarm-delay time period, then the alarm-delay function is terminated. The LED 't' will flash during the time period.

## Notes

### Reset delay time $t_r$

The reset-delay time period represents the time during after which the output contacts: 13 to 14 and 23 to 24 are switched on (when the frequency is within a permitted range). Should the frequency again enter the alarm state during the runoff of the reset-delay time period (when the speed exceed the required range), the reset-delay time period will be terminated. The LED 't' will flash during the same time period.

The start-up delay time period will override the reset-delay time period, i.e. when the output contacts are on by the start-up delay mode, then the reset-delay time period will be overridden (output contacts: 13 to 14 and 23 to 24 are closed). Even after an expiry of the start-up delay time period, the reset-delay time period will not be initiated.

### Display

In normal operating mode, all settings can be checked at any time by pressing the UP or DOWN keys.

Additionally, the frequency is displayed. However, this frequency does not correspond to the device's accuracy and is only designed for diagnostic purposes.

In the case of wiring errors and system failures corresponding diagnostic messages are displayed on the display.

### Parameterization using the display

See attached form page 49

### Change tracking

To detect non permitted changes of the settings, the menu item change tracking is available. This setting allows to activate a counter once, which is then incremented with each confirmed change of the settings. After activation of this function the user cannot reset the counter or disable this function again.

Only at variant / \_ 1

### Digital selection via the software Inputs: SW1 to SW4

Four various frequency modes with different response parameters, can be configured via the software Inputs: SW1 to SW4 (see Table). The electric power supply for the inputs should be between 10V DC and 26.4V DC to GND. A switchover configuration can also be undertaken during the operating mode. Should a frequency mode be altered whilst operating, then the switchover time period ( $t_{vJ}$ ) will commence, provided the output relays are switched on through the switchover, and the start-up delay time period has expired. During this time period, no speed evaluation will be conducted and the output relays remain energized (closed). Should during the switchover time period the speed modus again be altered, then the switchover time will not again be initiated. After the expiry of the switchover time period, the monitoring function will be continued at the currently set frequency mode). The switchover time period, for example can affect the overriding of an alarm message during the start-up stage- or the braking stage -of a generator or electric motor.

SW1	SW2	SW3	SW4	Mode
0	0	1	1	Frequency mode 1
0	1	1	0	Frequency mode 2
1	0	0	1	Frequency mode 3
1	1	0	0	Frequency mode 4

### Caution !

 Any continuously repeated switching over of the frequency modus (always immediately after the expiry of the switchover time period) can lead to the situation, that the equipment starts to function similarly as in the 'Muting Mode' (i.e. the frequency monitoring function is overridden and the output relays remain permanently on).

### Muting function

The frequency monitoring function can be overridden on the display and by an appropriate activation of the software Digital Inputs: SW1 to SW4. For this purpose, the muting function should be activated when parametering on the display. Once this function is activated, then it will continue to be possible to continue to switch over between the frequency moduses: 1 to 3, as described above. Should a selection be made of the frequency mode 4 (muting) via the 'SW' software inputs, then no further frequency monitoring will be conducted. The output relays remain permanently on and the start-up delay function ( $t_A$ ), the switchover time period function ( $t_U$ ), the reset-delay function ( $t_F$ ) and the alarm-delay function ( $t_V$ ) will all be reset.

### Analogue output A+ and A GND

The analogue output 2-10 V shows the actual measured frequency. The maximum value of the analogue output (10 V) is equal to the adjusted upper frequency threshold. The minimum value of the analogue output (2 V) is equal to the adjusted lower frequency threshold. The scaling is frequency linear.

In the monitoring function „underfrequency“ the maximum value of the analogue output is equal to the highest possible setting value of the device (Variant UH 6937/0\_ \_ = 600 Hz and UH 6937/1\_ \_ = 1000 Hz).

In the monitoring function „overfrequency“ the minimum value of the analogue output is equal to 0 Hz.

If the muting function is selected, the maximum value of the analogue output is equal to the maximum setting value of the device (Variant UH 6937/0\_ \_ = 600 Hz and UH 6937/1\_ \_ = 1000 Hz) and the minimum value is equal to 0 Hz.

In the case of a failure the analogue output goes to 0V.

The analogue output is not safety related. It can be used for diagnosis.

### Switchover time period $t_U$

The switchover time period expires when the frequency mode is altered during operations at the Software Inputs: SW1 to SW4, the output contacts are closed, no start-up delay function is running and the Switchover Time Period: 'tU' has not already been initiated and/or is running. During this time period, no frequency monitoring is conducted and the output contacts remain on.

## Device and function description

The parameterization menu has follow structure: Illustration shows the factory setting <sup>4)</sup>

## Technical Data

### Frequency Measuring Input

#### Voltage range

E1a-E2L, E1b-E3L: AC 8 ... 280 V  
 E1a-E2H, E1b-E3H: AC 16 ... 690 V  
 (dependent to frequency see characteristic)

#### Input frequency:

Variante /0\_ : < 700 Hz  
 Variante /1\_ : < 1200 Hz

**Galvanic separation:** Frequency measuring input to auxiliary voltage and output contacts

#### Response value

Variant /0\_ : adjustable from 1 Hz ... 600 Hz  
 Variant /1\_ : adjustable from 1 Hz ... 1000 Hz

#### Pulse frequency inverters

Variant /0\_ : ≥ 1 kHz  
 Variant /1\_ : ≥ 2 kHz  
 Measuring accuracy: < ± 2 %

#### Stability of the setting threshold at variation of auxiliary voltage and temperature:

< ± 1 %  
 adjustable from 2 ... 10 % of the set response value

#### Reaction time of frequency monitoring:

Duration of 1 cycle (inverse value of adjusted frequency) + 10 ms  
 + adjusted response delay

adjustable from 0.1 ... 100 s

Reset delay t<sub>r</sub>: adjustable from 0 ... 100 s

Switchover time period t<sub>u</sub>: adjustable from 0 ... 100 s

#### Accuracy of the adjustable times:

< ± 5 %

#### Auxiliary circuit (A1-A2)

#### Auxiliary voltage U<sub>H</sub>

(galvanic separation to measuring input):

DC 24 V

The power supply shall meet the requirements of SELV / PELV.

0.8 ... 1.1 U<sub>H</sub>

typ. 3.2 W

Short-circuit protection: Internal PTC

Oversupply protection: Internal VDR

Duty-cycle Reset button: > 3 s

#### Output

##### Contacts:

2 NO contacts

##### Contact type:

Relay forcibly guide

##### Thermischer Strom I<sub>th</sub>:

8 A

(see current limit curve)

#### Switching capacity

to AC 15: 3 A / AC 230 V IEC/EN 60 947-5-1  
 to DC 13: 2 A / DC 24 V IEC/EN 60 947-5-1  
 to DC 13: 4 A / DC 24 V at 0.1 Hz

#### Electrical life

at 5 A, AC 230 V cos φ = 1: > 2.2 × 10<sup>5</sup> switch. cycl. IEC/EN 60 947-5-1

#### Short circuit strength

max. fuse rating: 10 A gL IEC/EN 60 947-5-1

Mechanical life: 20 x 10<sup>6</sup> switching cycles

Semiconductor monitoring output: DC 24 V, 50 mA, plus switching

Analogue output: 2 ... 10 V, max. 10 mA

## Technical Data

### General Data

**Nominal operating mode:** continuous operation

#### Temperature range

operation: - 20 ... + 60°C  
 storage: - 20 ... + 70°C

**Altitude:** < 2.000 m

#### Clearance and creepage distance

rated impuls voltage / pollution degree:  
 measuring input to the remainder: 6 kV / 2 IEC 60 664-1  
 output to the remainder: 4 kV / 2 IEC 60 664-1

**EMC** IEC/EN 61 326-3-1, IEC/EN 62 061

Interference suppression: Limit value class B EN 55 011

#### Degree of protection:

Housing: IP 40 IEC/EN 60 529

Terminals: IP 20 IEC/EN 60 529

**Housing:** Thermoplastic with V0 behaviour according to UL subject 94

**Vibration resistance:** Amplitude 0.35 mm

frequency 10 ... 55 Hz IEC/EN 60 068-2-6

20 / 060 / 04 IEC/EN 60 068-1

DIN 46 228-1/-2/-3/-4

captive slotted screw

Mounting: DIN-rail IEC/EN 60 715

Weight: approx. 320 g

#### Dimensions

**Width x height x depth:** 45 x 107 x 121 mm

#### Standard Type

UH 6937.02PS/61 DC 24 V

Article number: 0066820

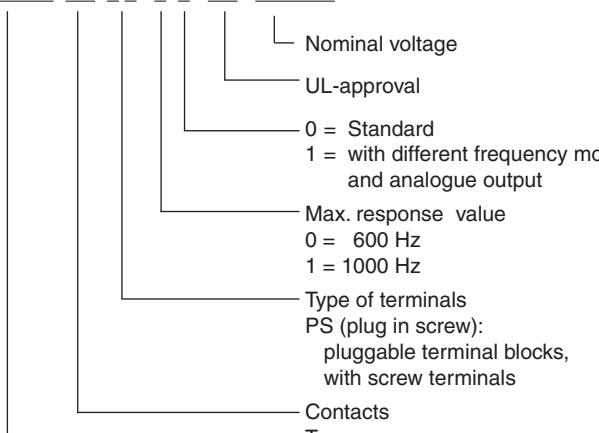

• Output: 2 NO contacts

• Auxiliary voltage U<sub>H</sub>: DC 24 V

• Width: 45 mm

#### Ordering Example

UH 6937 .02 \_ \_ /0\_ /61 DC 24 V

## UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL60947, "general use applications"

### Standards:

- ANSI/UL 60947-1, 5<sup>th</sup> Edition (Low-Voltage Switchgear and Controlgear Part1: General rules)
- ANSI/UL 60947-5-1, 3<sup>th</sup> Edition (Low-Voltage Switchgear and Controlgear Part5-1: Control circuit Devices an Switching Elements - Electro-mechanical Control Circuits Devices)
- CAN/CSA-C22.2 No. 60947-1-13, 2<sup>nd</sup> Edition (Low-Voltage Switchgear and Controlgear - Part1: General rules)
- CAN/CSA-C22.2 No. 60947-1-14, 1<sup>st</sup> Edition (Low-Voltage Switchgear and Controlgear - Part5-1: Control circuit Devices an Switching Elements - Electromechanical Control Circuits Devices)

### Nominal voltage U<sub>N</sub>:

DC 24 V:

Device must be supplied with a Class 2 or a voltage / current limited power supply.

### Switching capacity:

Semiconductor monitoring outputs:

24Vdc, 50mA, pilot duty

### Switching capacity

Relay output

device free-standing:

Ambient temperature 60°C: Pilot duty B300, Q300  
8A 250Vac G.P.  
8A 24 Vdc

Device mounted without distances heated by devices with same load:

Ambient temperature 55°C: Pilot duty B300, Q300  
5A 250Vac G.P.  
5A 24 Vdc

Ambient temperature 60°C: Pilot duty C300, Q300  
4A 250Vac G.P.  
4A 24 Vdc

AC 8 ... 280 V  
AC 16 ... 600 V

### Wire connection

Ambient temperature 60°C, 4A bzw. 55°C, 5A:

min. 75°C aluminum or copper conductors

Ambient temperature 60°C, 8A:

min. 90°C aluminum or copper conductors

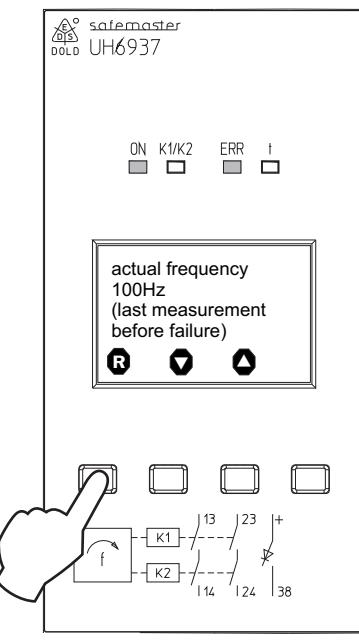

Technical data that is not stated in the UL-Data, can be found in the technical data section.

## Troubleshooting

Failure	Potential cause
LED „ON“ does not light up	- Power supply A1+/A2 not connected
LED „ON“ flashes red	- Parameterization error (detailed description on display)
LED „ERR“ flashes red	- External failure (detailed description on display)
LED „ERR“ continuously on	- Device failure (if the failure still exists after restart, replace device)

## Fault handling

When faults are detected on or in the device they are indicated on the display by an appropriate message. If a reset of the device is necessary due to the fault, at first the alarm and the associated diagnostic message have to be acknowledged. Then, the left key has to be pressed for approx. 3 sec. to initiate a reset of the device.

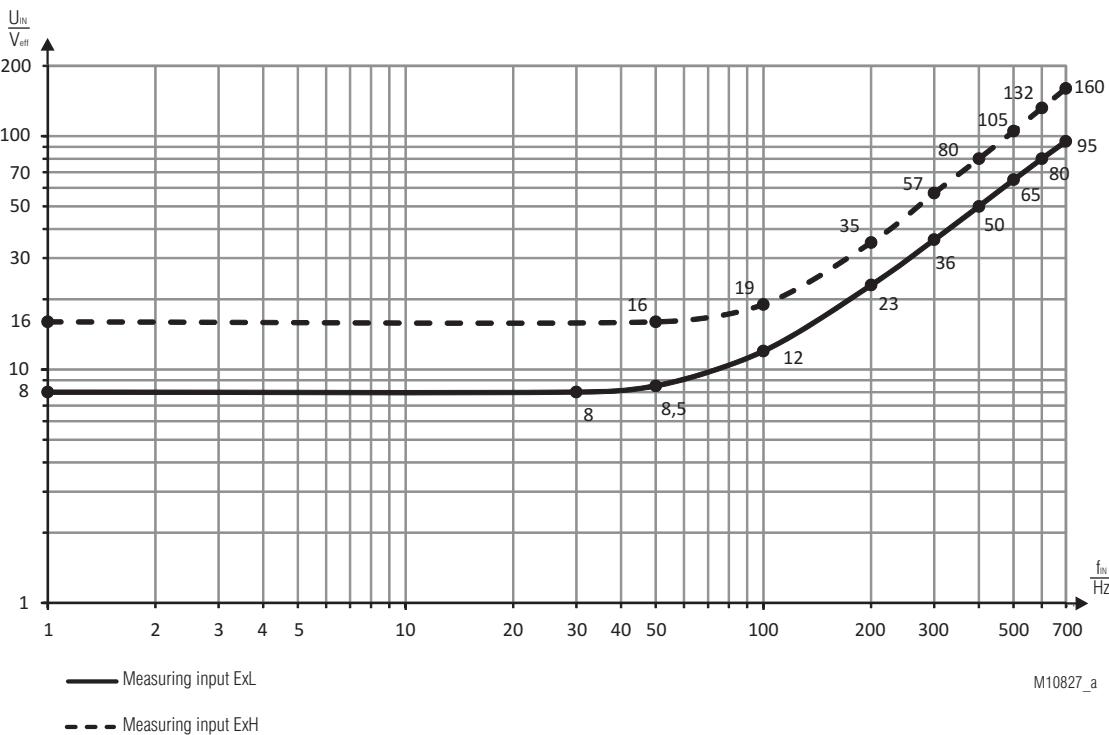

M11279

If a system failure is detected again after restart the device must be replaced and sent back to manufacturer.

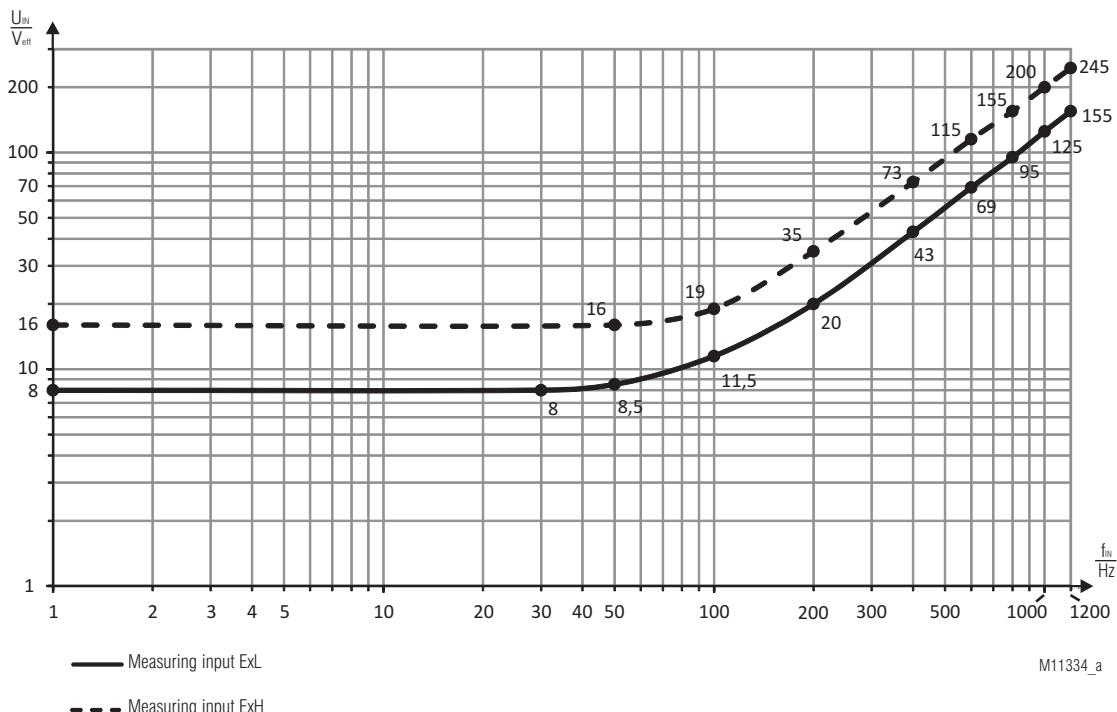

## Maintenance and repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristic

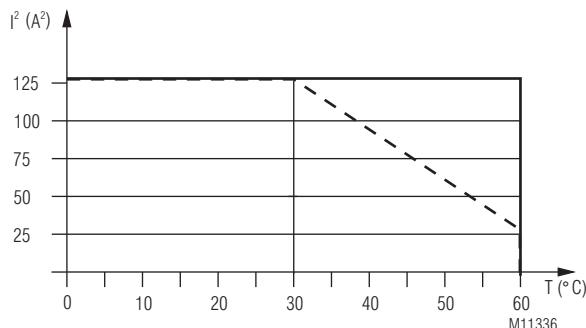

Min. voltage at measuring input for variant /0\_ \_

Min. voltage at measuring input for variant /1\_ \_

## Characteristic

device free-standing  
 — max. current at 60°C over  
 2 contact path =  $8\text{A} = \sqrt{2 \times 8^2 \text{A}^2} = 128\text{A}^2$

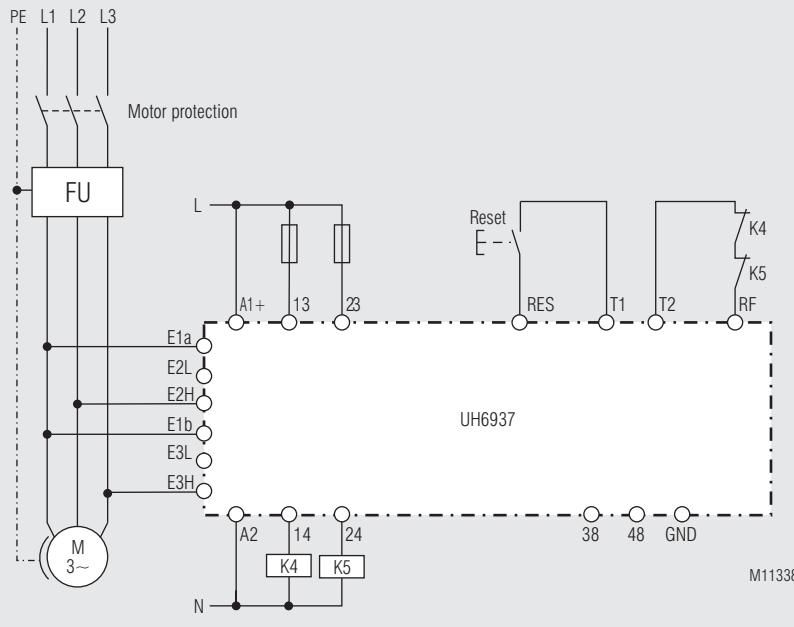

device mounted without distance heated by  
 — — — devices with same load,  
 max. current at 60°C over  
 2 contact path =  $4\text{A} = \sqrt{2 \times 4^2 \text{A}^2} = 32\text{A}^2$

$$\sum I^2 = I_1^2 + I_2^2$$

## SAFEMASTER C Multifunctional Safety Timer UG 6960

**DOLD** 

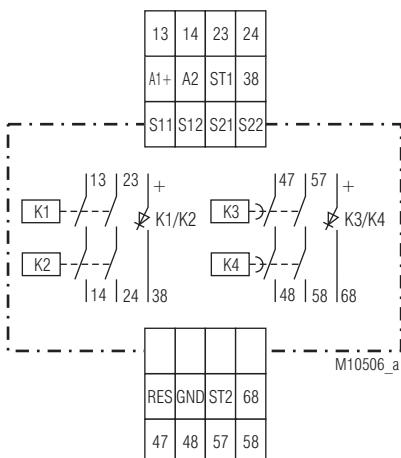

0269008

### Product Description

The multifunction safety timer UG 6960 provides protection of men and machines by enabling and disabling a safety circuit. This is done by the adjusted time delay function. Simply select 1 out of 5 delay functions with a rotary switch – ready. The adjusted time is safe over the complete setting range. The UG 6960 is available for different safety functions. It has safe delayed and instantaneous contacts.

### Circuit Diagram

### Connection Terminals

Terminal designation	Signal description
A1 +	DC 24 V
A2	0 V
13, 14, 23, 24	Forcibly guided NO contacts for release circuit
47, 48, 57, 58	Forcibly guided NO contacts for delayed contacts
38, 68	Semiconductor monitoring output
GND	Reference potential for Semiconductor monitoring output
S11, S21	Control output
S12, S22, ST1, ST2, RES	Control input

### Your Advantage

- **Various delay functions adjustable at device:**
  - Release delay
  - Release delay retriggerable
  - On delay
  - Fleeting on make / break
  - Delay function settable via potentiometer
- **Various safety functions defined:**
  - E-Stop
  - Safety gate
  - Two-hand control
  - Safety mat / Safety edge
  - Exclusive or contacts
  - Light curtain
- Manual or auto start
- Instantaneous contact and safety delayed contacts
- Protection against manipulation by sealable transparent cover

### Features

- **According to**
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508 and IEC/EN 61511
- Acc. to EN 50156-1 for furnaces
- Line fault detection on On-button:
- Manual restart or automatic restart
- With or without cross fault monitoring
- 2-channel
- Forcibly guided output contacts
- Output: 2 NO instantaneous contact and 2 NO contacts delayed
- 1 semiconductor output for instantaneous contacts
- 1 semiconductor output for delayed contacts
- LED indicator for operation, safety function, time delay and failure
- As option with pluggable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width: 22.5 mm

### Approvals and Markings

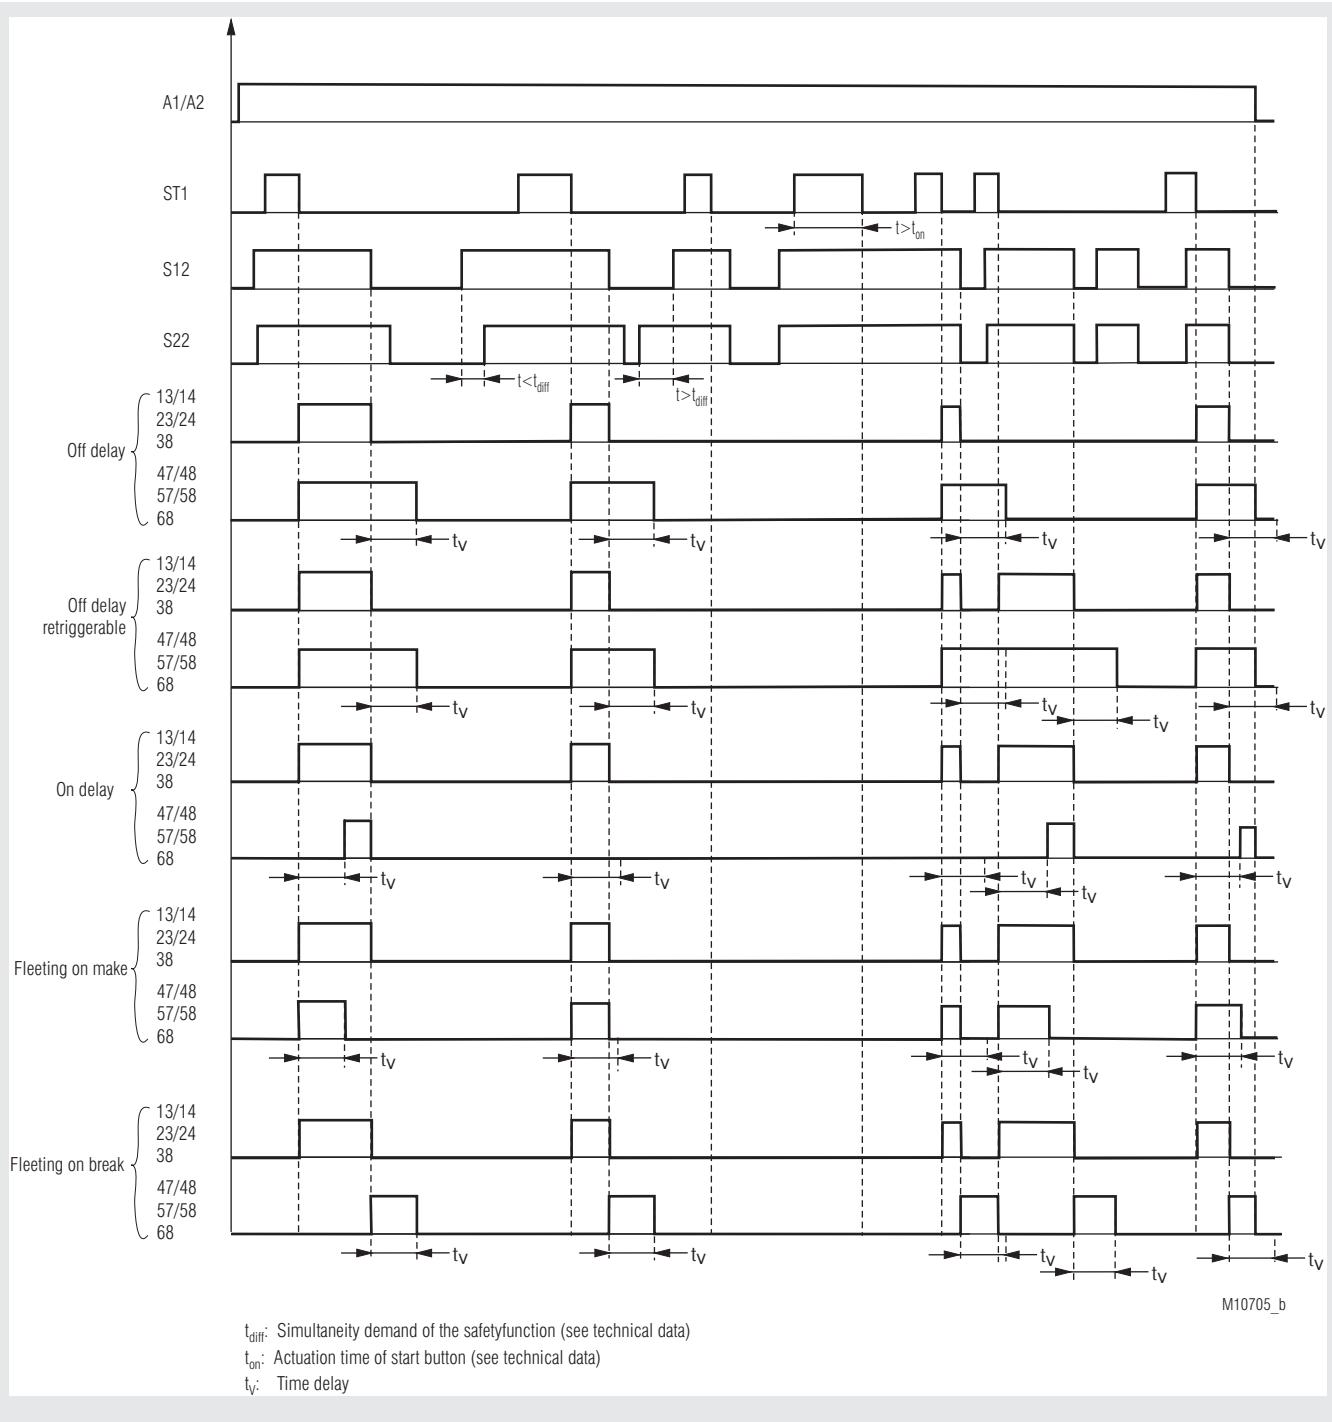

### Application

Protect people and machines in applications with e-stop buttons, safety gates, light curtains with selftesting (Type 4) acc. to IEC/EN 61 496-1, 2-hand controls for presses as well as other production machinery with dangerous closing action (Type III C to EN 574) and for safety mats, safety edges and tape switches with a max. switching current of 15 mA.

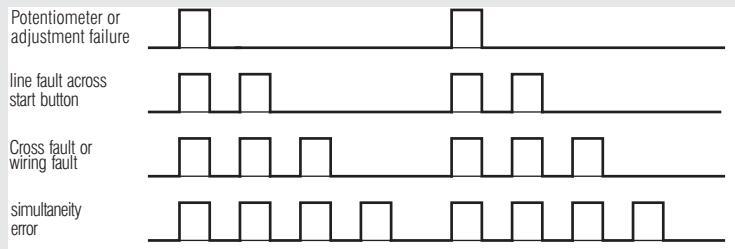

### Indicators

## Function Diagram

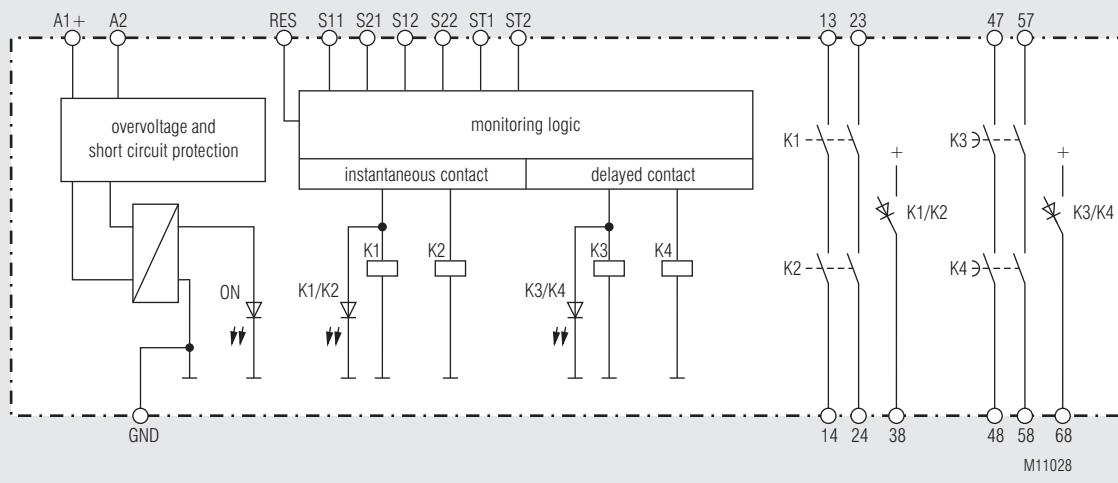

## Fault Indication by Flashing Code

M10697\_a

## Block Diagrams

## Practical Notes

### Operating mode

Manual or auto start is chosen by wiring. On manual start S21 has to be connected to ST1! via an NO push button. For auto start S21 is connected to ST2. If both inputs are connected to S21 the unit goes into safe failure mode. A restart or new start of the device has to be made. Only an automatic start at safety function two-hand control /3\_\_ is possible.

### Line fault detection e.g. monitoring of ON-button

If the On-button pressed more than 3 s the adequate output contacts of the safety function can't be switch. The output contacts can be energized when the On-button pressed again ( $0.1 \text{ s} < t_{\text{ON}} < 3 \text{ s}$ ).

A line fault is detected if the On-button more than 10 s is actuated. The output contacts of the adequate safety function can only be energized with a reset or re-start with on an off switching of power supply.

### Reset and external failures:

The reset input is used to reset external failures (application failures or removable external failures as e.g. a line fault on reset button). If the reset signal is connected to the input for more than 3 sec the unit makes a reset. A new reset is only possible when the reset signal had been switched off temporarily.

If an external failure occurs because both input channels of a safety function did not switch on or off within the simultaneous time, a reset is only possible if both channels are switched to off state after removing failure cause.

### Setting delay mode

On the variant /\_0\_ the delay mode can be set via rotary switch  $t_{\text{Fkt}}$ .

Possible functions:

$t_{\text{Fkt}}$	Function
1	Release delay
2	Release delay retriggerable
3	On delay
4	Fleeting on make
5	Fleeting on break

### Description of the time delay functions

#### Off delay

If the sensors/switches of the safety function are switched off or an external failure in the safety function is detected, the adjusted time delay is started. After elapse of the delay time the delayed contacts switch off. Restarting of the output contacts is only possible after the time is fully elapsed.

#### Off delay retriggerable

If the sensors/switches of the safety function are switched off or an external failure in the safety function is detected, the adjusted time delay is started. After elapse of the delay time the delayed contacts switch off. On before the time is elapsed, or the external failure is removed and reset and the starting conditions are fulfilled (manual or auto start) the delayed contacts remain switched on.

#### On delay

If the sensors/switches of the safety function are switched on the adjusted time delay is started. After elapse of the delay time the delayed contacts switch on. If the sensors/switches of the safety function are switched off before the time is elapsed, the time is stopped and the delayed safety contacts remain switched off. When the sensors/switches of the safety function are switched on again then the time delay is started from the beginning.

## Practical Notes

### Fleeting on make

If the sensors/switches of the safety function are switched on, the delayed contacts are switched on and the adjusted time delay is started. After elapse of the delay time the delayed contacts switch off.

If the sensors/switches of the safety function are switched off before the time is elapsed the delayed safety contacts are also switched off.

### Fleeting on break

If the sensors/switches of the safety function are switched off or an external failure in the safety function is detected, the delayed safety contacts are switched on and the adjusted time delay is started.

After elapse of the delay time the delayed contacts switch off. If the sensors/switches of the safety function are switched off before the time is elapsed the delayed safety contacts are also switched off again.

### Adjusting the time delay

With rotary switch  $t_{\text{max}}$  the time range for the delayed contacts is selected. With rotary switch  $t$  the time is adjusted within the selected range in 10 % steps.

Example: required time = 0.8 s

#### 1. Example:

$$t_{\text{max}} = 1 \text{ s} ; t = 0.8 \geq t_v = t_{\text{max}} \times t = 1 \text{ s} \times 0.8 = 0.8 \text{ s}$$

#### 2. Example:

$$t_{\text{max}} = 2 \text{ s} ; t = 0.4 \geq t_v = t_{\text{max}} \times t = 2 \text{ s} \times 0.4 = 0.8 \text{ s}$$

### Repeat accuracy

The repeat accuracy of the delayed contact depends on different factors:

Repeat accuracy  $t_w = \text{system reaction time}^1 \pm 1 \% \text{ of } t_v$

<sup>1)</sup> Pick up or drop off time depending on delay mode

## UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL 508, "general use applications"

**Ambient temperature:** -15 ... +55°C

### Switching capacity:

Ambient temperature 55°C Pilot duty B300, Q300  
5A 250Vac Resistive or G.P.  
5A 24Vdc Resistive

Ambient temperature 40°C: Pilot duty B300, Q300  
8A 250Vac Resistive or G.P.  
8A 24Vdc G.P.

### Wire connection::

PS-terminal: 60°C / 75°C copper conductors only  
AWG 28 - 12 Sol/Str Torque 0.5 Nm  
PC-terminal: AWG 24 - 12 Sol/Str  
PT-terminal: AWG 24 - 16 Sol/str

Technical data that is not stated in the UL-Data, can be found in the technical data section.

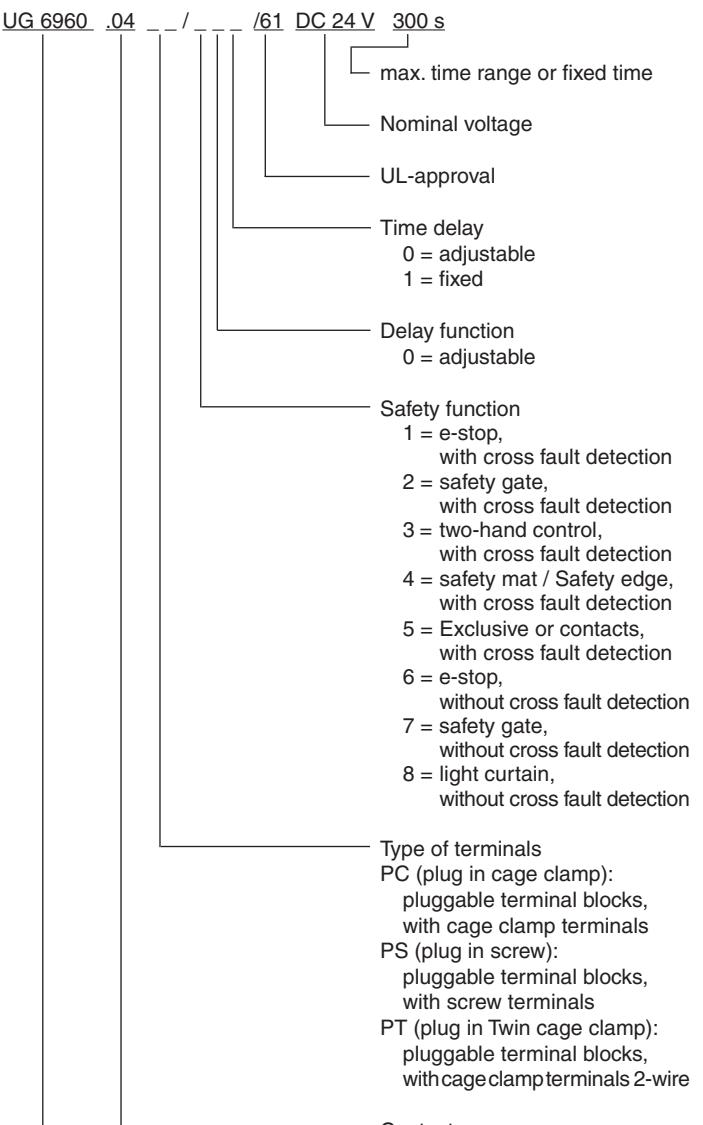

## Standard Type

UG 6960.04PS/100/61 DC24V 300 s

Article number: 0065424

- Safety function: e-stop
- Delay function: adjustable
- Time delay: adjustable
- Output: 2 NO contacts instantaneous contacts  
2 NO contacts delayed contacts
- Nominal voltage: DC 24 V
- Width: 22.5 mm

## Variants

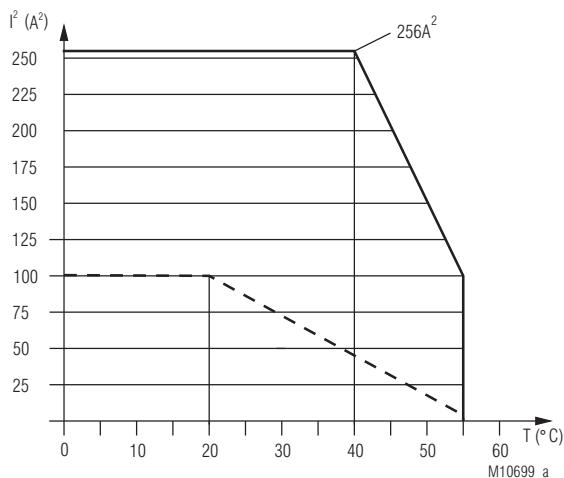

## Troubleshooting

Failure	Potential cause
LED "ON" does not light up	- Power supply A1+/A2 not connected
LED "ERR" flashes in relation 1:1	- Under- or overvoltage (check power supply A1+/A2)
LED "ERR" flashes in relation 4:1	- external failure (see flashing code)
LED "ERR" continuously on	- system error (if cannot be removed after restart unit must be replaced)

## Maintenance and Repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristics

device free-standing

max. current at 55°C over

$$4 \text{ contact path} = 5 \text{A} \triangleq 4 \times 5^2 \text{A}^2 = 100 \text{A}^2$$

device mounted without distance heated by  
devices with same load,

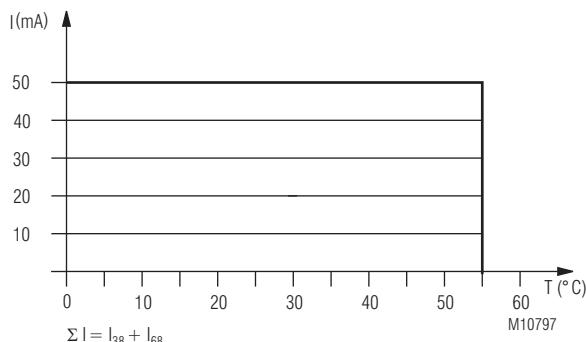

max. current at 55°C over

$$4 \text{ contact path} = 1 \text{A} \triangleq 4 \times 1^2 \text{A}^2 = 4 \text{A}^2$$

$$\sum I^2 = I_1^2 + I_2^2 + I_3^2 + I_4^2$$

$I_1, I_2, I_3, I_4$  - current in contact paths

Quadratic total current limit curve output contacts

$$\Sigma I = I_{38} + I_{68}$$

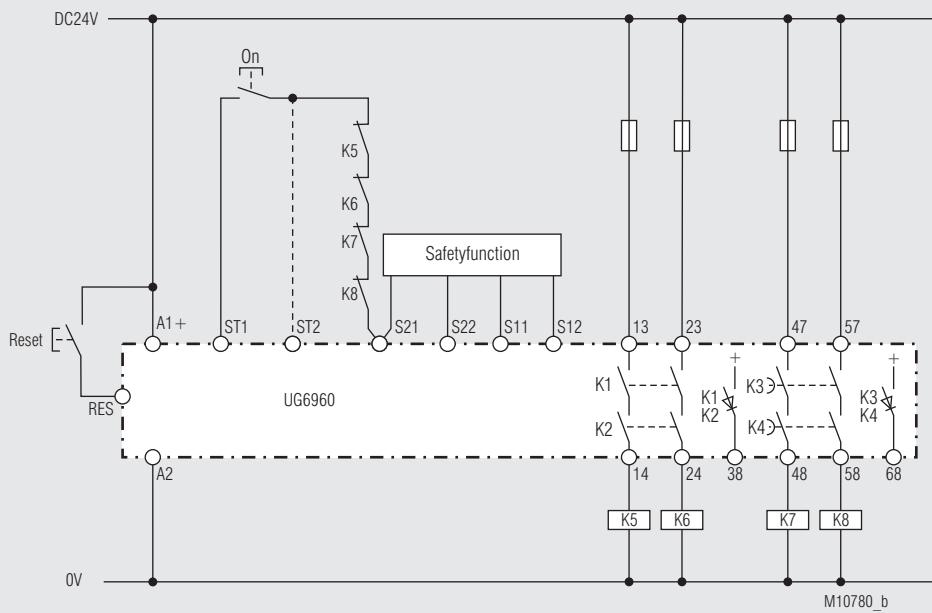

$$\text{z.B.: } \Sigma I = 35 \text{mA} + 15 \text{mA} = 50 \text{mA}$$

$I_{38}$  - current semiconductor output 38

$I_{68}$  - current semiconductor output 68

Quadratic total current limit curve semiconductor monitoring outputs

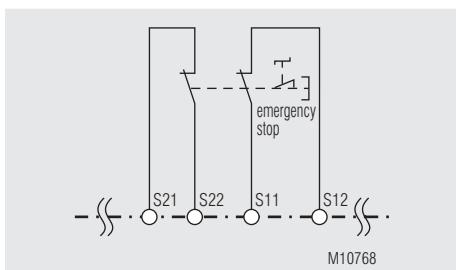

## Application Examples with safety function

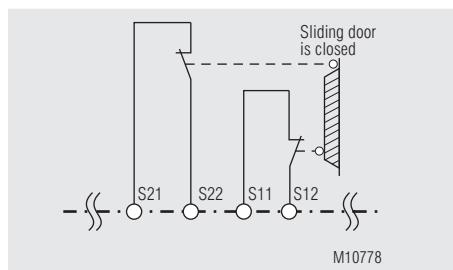

Safetyfunction: see below, Manual-Start (for automatic start make a bridge to ST2 instead of ON button).

Delay function: release delay (1)

## SAFEMASTER C Multifunctional Safety Timer UG 6961

0289009

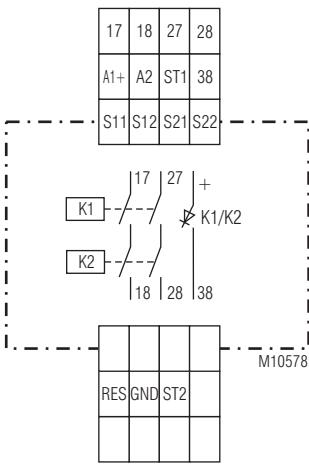

### Your Advantage

- Various delay functions adjustable at device:
  - Release delay
  - Release delay retriggerable
  - On delay
  - Fleeting on make / break
  - Delay function settable via potentiometer
- Various safety functions defined:
  - E-Stop
  - Safety gate
  - Two-hand control
  - Safety mat / Safety edge
  - Exclusive or contacts
  - Light curtain
- Manual or auto start
- Protection against manipulation by sealable transparent cover

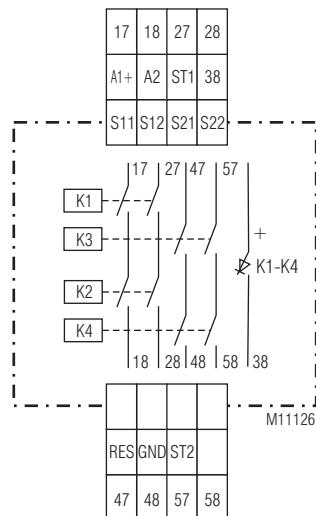

### Product Description

The multifunctional safety timer UG 6961 provides protection of men and machines by enabling and disabling a safety circuit. This is done by the adjusted time delay function. Simply select 1 out of 5 delay functions with a rotary switch – ready. The adjusted time is safe over the complete setting range. The UG 6961 is available for different safety functions. It has safe delayed and instantaneous contacts.

### Circuit Diagram

UG 6961.02

UG 6961.04

### Features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508 and IEC/EN 61511
- Acc. to EN 50156-1 for furnaces
- Line fault detection on On-button:
- Manual restart or automatic restart
- With or without cross fault monitoring
- 2-channel
- Forcibly guided output contacts
- Output: max. 4 NO instantaneous semiconductor monitoring output
- LED indicator for operation, delay contacts and failure
- As option with pluggable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width: 22.5 mm

### Approvals and Markings

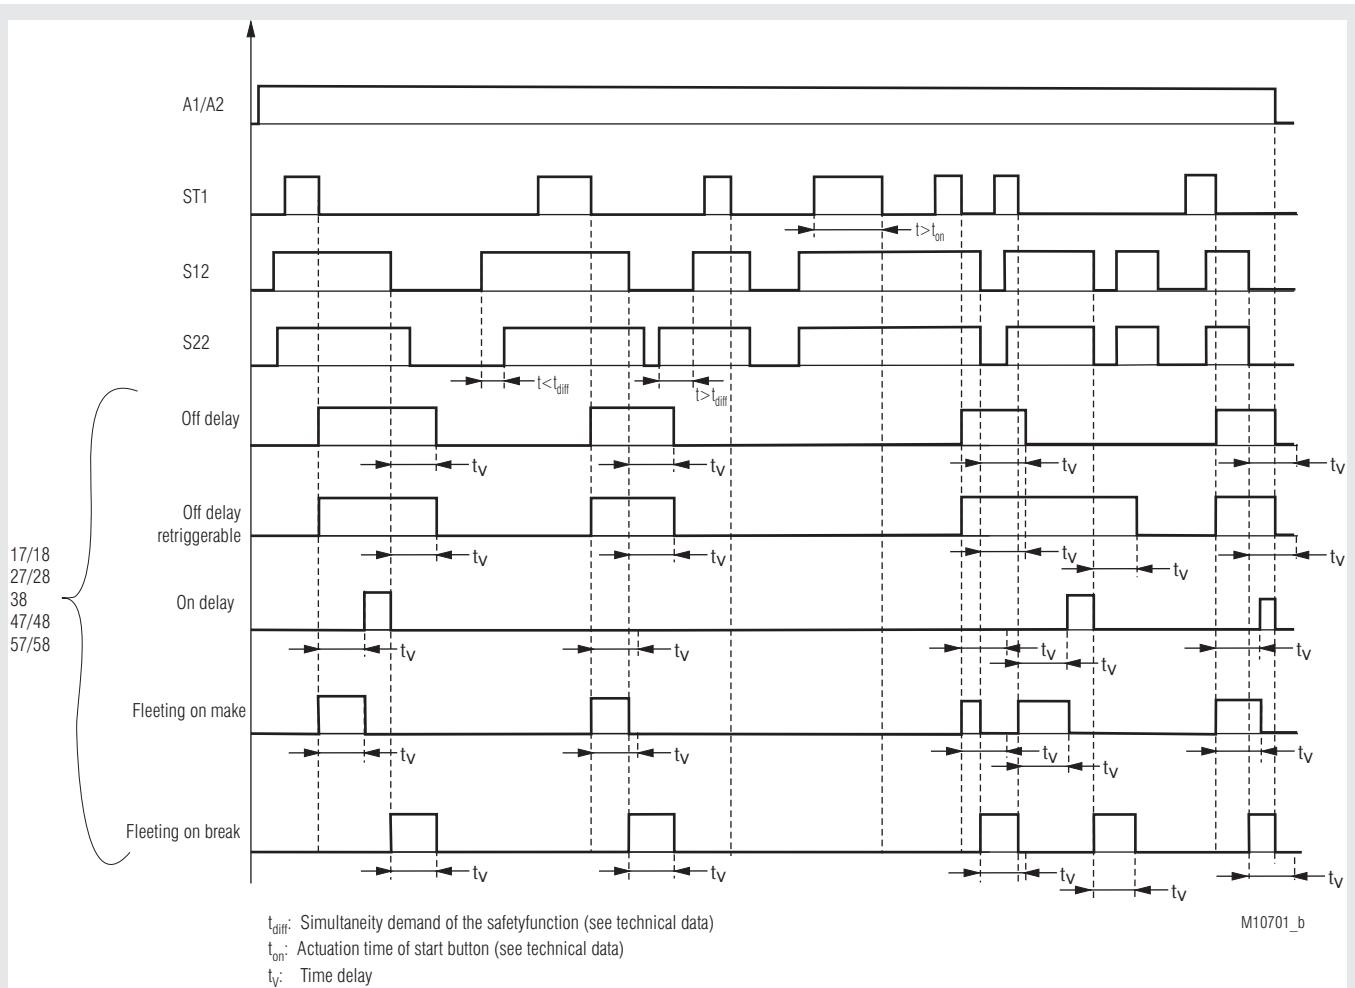

### Connection Terminals

Terminal designation	Signal description
A1 +	DC 24 V
A2	0 V
17, 18, 27, 28, 47, 48, 57, 58	Forcibly guided NO contacts for delay contacts
38	Semiconductor monitoring output
GND	Reference potential for Semiconductor monitoring output
S11, S21	control output
S12, S22, ST1, ST2, RES	control input

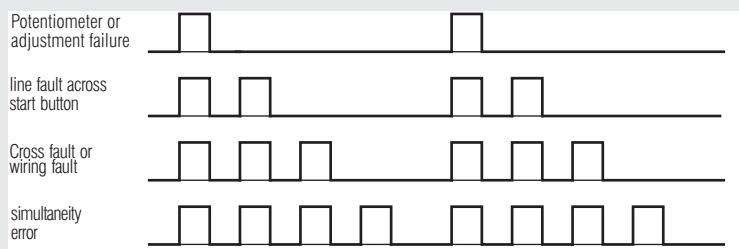

### Indicators

- green LED ON: on, when supply connected
- red LED ERR: on, at internal error  
flashes at external error
- green LED K1/K2 (.02)  
e.g. K1-K4 (.04): on, when relay K1 and K2 (.02)  
energized, e.g. when relay  
K1, K2, K3 and K4 (.04) energized  
flashes during time delay

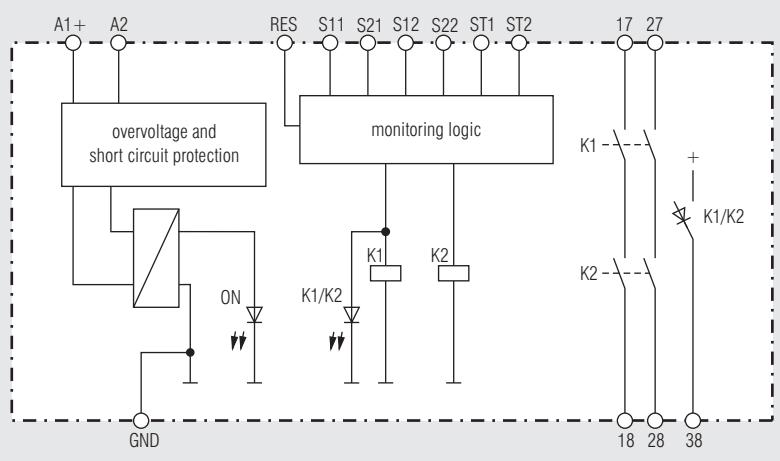

## Function Diagram

## Fault Indication by Flashing Code

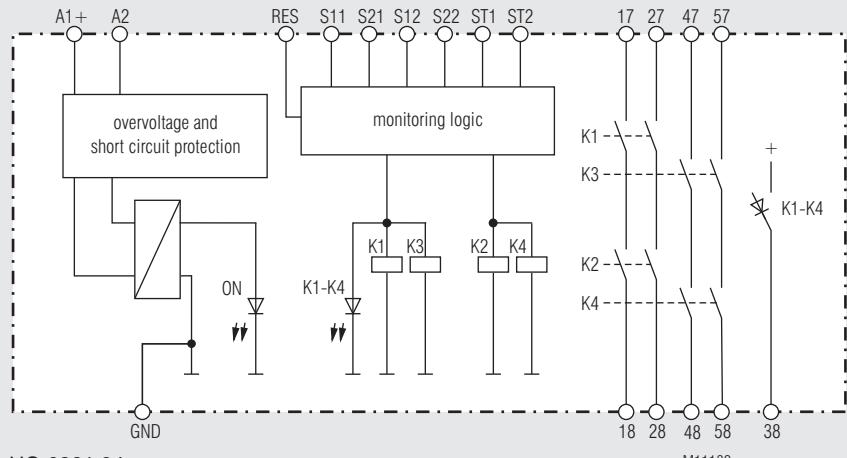

## Block Diagrams

UG 6961.02

M11030

UG 6961.04

M11132

## Practical Notes

### Operating mode

Manual or auto start is chosen by wiring. On manual start S21 has to be connected to ST1! via an NO push button. For auto start S21 is connected to ST2. If both inputs are connected to S21 the unit goes into safe failure mode. A restart or new start of the device has to be made. Only an automatic start at safety function two-hand control /3.../ is possible.

### Line fault detection e.g. monitoring of ON-button

If the On-button pressed more than 3 s the adequate output contacts of the safety function can't be switch. The output contacts can be energized when the On-button pressed again ( $0.1 \text{ s} < t_{\text{ON}} < 3 \text{ s}$ ).

A line fault is detected if the On-button more than 10 s is actuated. The output contacts of the adequate safety function can only be energized with a reset or re-start with on an off switching of power supply.

### Reset and external failures:

The reset input is used to reset external failures (application failures or removable external failures as e.g. a line fault on reset button). If the reset signal is connected to the input for more than 3 sec the unit makes a reset. A new reset is only possible when the reset signal had been switched off temporarily.

If an external failure occurs because both input channels of a safety function did not switch on or off within the simultaneous time, a reset is only possible if both channels are switched to off state after removing failure cause.

### Setting delay mode

On the variant /\_0/\_ the delay mode can be set via rotary switch  $t_{\text{Fkt}}$ .

Possible functions:

$t_{\text{Fkt}}$	Function
1	Release delay
2	Release delay retriggerable
3	On delay
4	Fleeting on make
5	Fleeting on break

### Description of the time delay functions

#### Off delay

If the sensors/switches of the safety function are switched off or an external failure in the safety function is detected, the adjusted time delay is started. After elapse of the delay time the contacts switch off.

Restarting of the output contacts is only possible after the time is fully elapsed.

#### Off delay retriggerable

If the sensors/switches of the safety function are switched off or an external failure in the safety function is detected, the adjusted time delay is started. After elapse of the delay time the delayed contacts switch off.

On before the time is elapsed, or the external failure is removed and reset and the starting conditions are fulfilled (manual or auto start) the contacts remain switched on.

#### On delay

If the sensors/switches of the safety function are switched on the adjusted time delay is started. After elapse of the delay time the contacts switch on.

If the sensors/switches of the safety function are switched off before the time is elapsed, the time is stopped and the safety contacts remain switched off. When the sensors/switches of the safety function are switched on again then the time delay is started from the beginning.

## Practical Notes

### Fleeting on make

If the sensors/switches of the safety function are switched on, the contacts are switched on and the adjusted time delay is started. After elapse of the delay time the contacts switch off.

If the sensors/switches of the safety function are switched off before the time is elapsed the safety contacts are also switched off.

### Fleeting on break

If the sensors/switches of the safety function are switched off or an external failure in the safety function is detected, the safety contacts are switched on and the adjusted time delay is started.

After elapse of the delay time the contacts switch off. If the sensors/switches of the safety function are switched off before the time is elapsed the safety contacts are also switched off again.

### Adjusting the time delay

With rotary switch  $t_{\text{max}}$  the time range for the delayed contacts is selected. With rotary switch  $t$  the time is adjusted within the selected range in 10 % steps.

Example: required time = 0.8 s

#### 1. Example:

$$t_{\text{max}} = 1 \text{ s} ; t = 0.8 \geq t_v = t_{\text{max}} \times t = 1 \text{ s} \times 0.8 = 0.8 \text{ s}$$

#### 2. Example:

$$t_{\text{max}} = 2 \text{ s} ; t = 0.4 \geq t_v = t_{\text{max}} \times t = 2 \text{ s} \times 0.4 = 0.8 \text{ s}$$

### Repeat accuracy

The repeat accuracy of the delayed contact depends on different factors:

Repeat accuracy  $t_w = \text{system reaction time}^j \pm 1 \% \text{ of } t_v$

<sup>j</sup>) Pick up or drop off time depending on delay mode

## Technical Data

### Switching capacity

to AC 15

3 A / AC 230 V IEC/EN 60 947-5-1

to DC 13

2 A / DC 24 V IEC/EN 60 947-5-1

### Electrical life

at 5 A, AC 230 V cos  $\varphi$  = 1: > 2.2 x 10<sup>5</sup> switching cycles

**Perm. operating frequency:** max. 1800 switching cycles / h

### Short circuit strength

max. fuse rating: 6 A gG / gL IEC/EN 60 947-5-1

**Mechanical life:** 10 x 10<sup>6</sup> switching cycles

**Semiconductor monitoring output (not safety):** max. 50 mA DC 24 V, plus switching

### General Data

**Nominal operating mode:** continuous operation

### Temperature range

Operation: - 25 ... + 55 °C

Storage: - 25 ... + 85 °C

**Altitude:** < 2.000 m

### Clearance and creepage distance

rated impulse voltage / pollution degree: 4 kV / 2 IEC 60 664-1

**EMC** IEC/EN 61 326-3-1, IEC/EN 62 061

**Interference suppression:** Limit value class B EN 55 011

### Degree of protection

Housing: IP 40 IEC/EN 60 529

Terminals: IP 20 IEC/EN 60 529

**Housing:** thermoplastic with VO behaviour

according to UL subj. 94

**Vibration resistance:** Amplitude 0,35 mm

**Klimatic resistance:** Frequency 10 ... 55 Hz, IEC/EN 60 068-2-6

25 / 055 / 04 IEC/EN 60 068-1

EN 50 005

**Wire fixing:** captive slotted screw

or cage clamp terminals

**Mounting:** DIN rail IEC/EN 60 715

**Weight:** approx. 210 g

### Dimensions

#### Width x height x depth:

UG 6961 PS: 22.5 x 110 x 120.3 mm

## Standard Type

UG 6961.02PS/100/61 DC24V 300 s

Article number: 0065425

- Safety function: e-stop
- Delay function: adjustable
- Time delay: adjustable
- Output: 2 NO contacts
- Nominal voltage: DC 24 V
- Width: 22.5 mm

## Variants

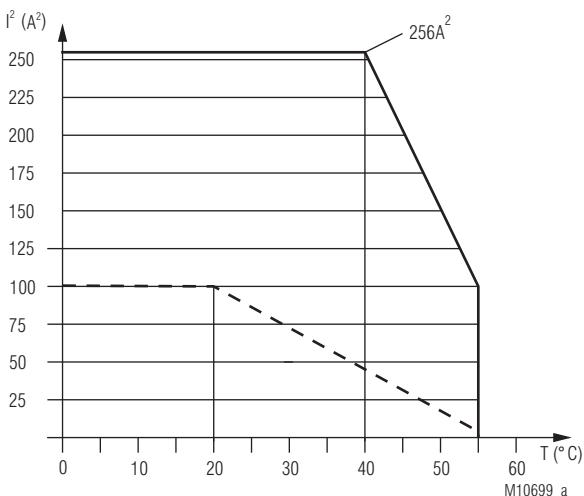

## Troubleshooting

Failure	Potential cause
LED "ON" does not light up	- Power supply A1+/A2 not connected
LED "ERR" flashes in relation 1:1	- Under- or overvoltage (check power supply A1+/A2)
LED "ERR" flashes in relation 4:1	- external failure (see flashing code)
LED "ERR" continuously on	- system error (if cannot be removed after restart unit must be replaced)

## Maintenance and Repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristics

device free-standing  
 — max. current at  $55^\circ C$  over  
 $4$  contact path =  $5A \triangleq 4x5^2A^2 = 100A^2$

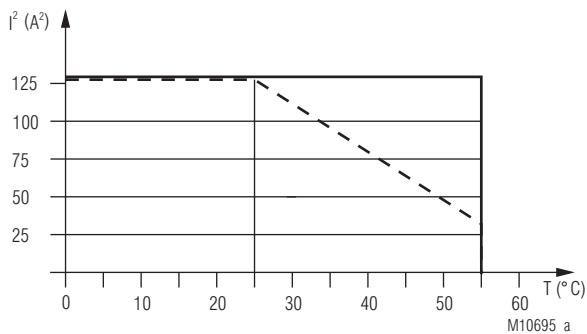

device mounted without distance heated by  
 - - - devices with same load,  
 max. current at  $55^\circ C$  over  
 $4$  contact path =  $1A \triangleq 4x1^2A^2 = 4A^2$

$$\sum I^2 = I_1^2 + I_2^2 + I_3^2 + I_4^2$$

$I_1, I_2, I_3, I_4$  - current in contact paths

UG 6961.04

Quadratic total current limit curve

device free-standing  
 — max. current at  $55^\circ C$  over  
 $2$  contact path =  $8A \triangleq 2x8^2A^2 = 128A^2$

device mounted without distance heated by  
 - - - devices with same load,  
 max. current at  $55^\circ C$  over  
 $2$  contact path =  $4A \triangleq 2x4^2A^2 = 32A^2$

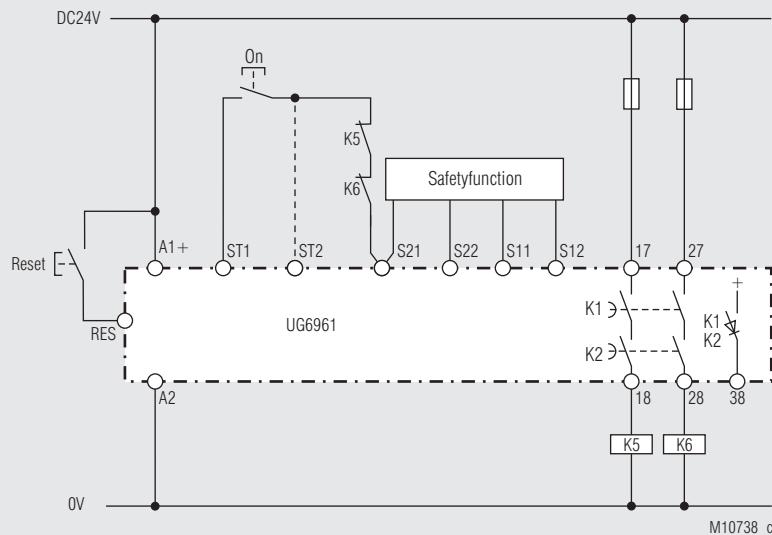

$$\sum I^2 = I_1^2 + I_2^2$$

## **Application Examples with safety function**

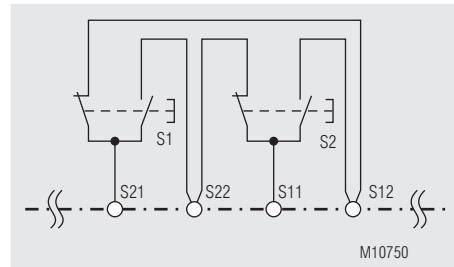

Safetyfunction: see below, Manual-Start (for automatic start make a bridge to ST2 instead of ON button).  
Delay function: release delay (1)

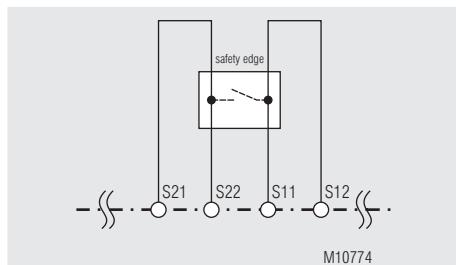

Fct.: E-stop (1),  
with cross fault detection  
SIL 3, PL e, Cat. 4

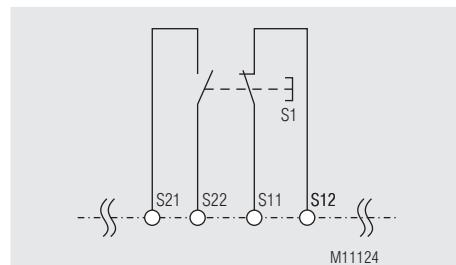

Fct.: Safety gate (2),  
with cross fault detection  
SIL 3, PL e, Cat. 4

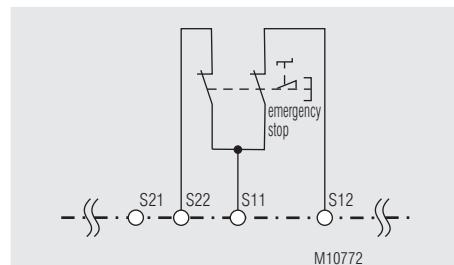

Fct.: Two-hand control (3),  
with cross fault detection  
SIL 3, PL e, Cat. 4  
Type III C to EN 574

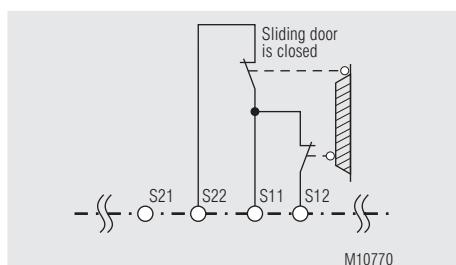

Fct.: Safety mat / Safety edge (4),  
with cross fault detection  
SIL 3, PL e, Cat. 4

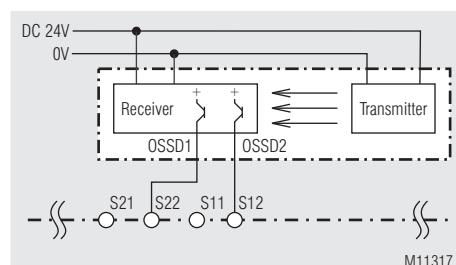

Fct.: Exclusive or contacts (5),  
with cross fault detection  
SIL 3, PL e, Kat. 4

Fct.: E-Stop (6),  
without cross fault detection  
SIL 3, PL e, Cat. 4<sup>1)</sup>

Fct.: Safety gate (7),  
without cross fault detection  
SIL 3, PL e, Cat. 4<sup>1)</sup>

Fct.: Light curtain (8),  
without cross fault detection  
SIL 3, PL e, Cat. 4<sup>2)</sup>

1) To achieve the stated safety classification the wiring has to be done with crossfault monitoring.

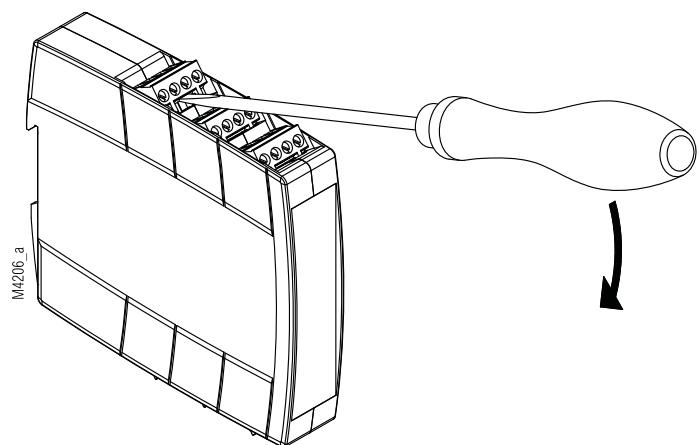

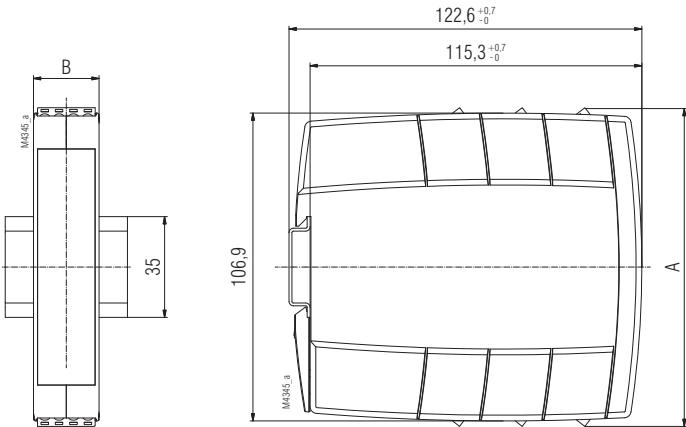

2) To achieve the stated safety classification light curtains with selftest (type 4) according to IEC/EN 61496-1 have to be used.

## SAFEMASTER C Multifunctional Safety Module UG 6970

**DOLD** 

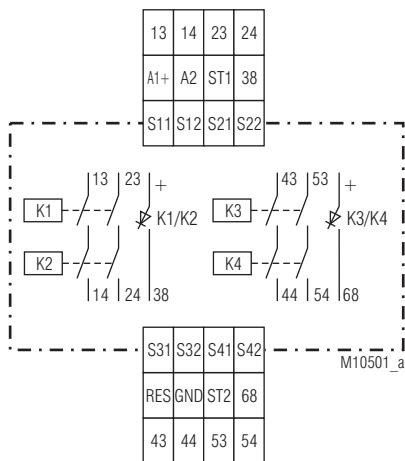

0269010

### Product Description

The multifunctional safety module UG 6970 provides protection of men and machines by enabling and disabling a safety circuit. It is used together with e-stop buttons, safety gates, light curtains with self testing (type 4) to IEC/EN 61496-1, 2-hand buttons on presses for metal processing and productions machines with dangerous closing movements (type III C to EN 574) and safety mats, edges and tape switches. Simply select 2 out of 5 safety functions on rotary switches - ready. This reduces divers types of safety modules in stock and simplifies your disposition.

### Circuit Diagram

### Connection Terminals

Terminal designation	Signal description
A1 +	DC 24 V
A2	0 V
13, 14, 23, 24, 43, 44, 53, 54	Forcibly guided NO contacts for release circuit
38, 68	Semiconductor monitoring output
GND	Reference potential for Semiconductor monitoring output
S11, S21, S31, S41	control output
S12, S22, S32, S42, ST1, ST2, RES	control input

### Your Advantage

- 2 independent, separately adjustable safety functions:
  - E-Stop
  - Safety gate
  - Two-hand control
  - Safety mat / Safety edge
  - Exclusive or contacts
  - Light curtain
- Only one device, two safety functions at the same time
- Manual or auto start
- Protection against manipulation by sealable transparent cover

### Features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508 and IEC/EN 61511
- Acc. to EN 50156-1 for furnaces
- Line fault detection on On-button:
- Manual restart or automatic restart
- With or without cross fault monitoring
- 2-channel
- Forcibly guided output contacts
- Output: 2 NO contacts per safety function
- 1 semiconductor output per safety function
- LED indicator for operation, safety function 1, 2 and failure
- As option with pluggable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width: 22.5 mm

### Approvals and Markings

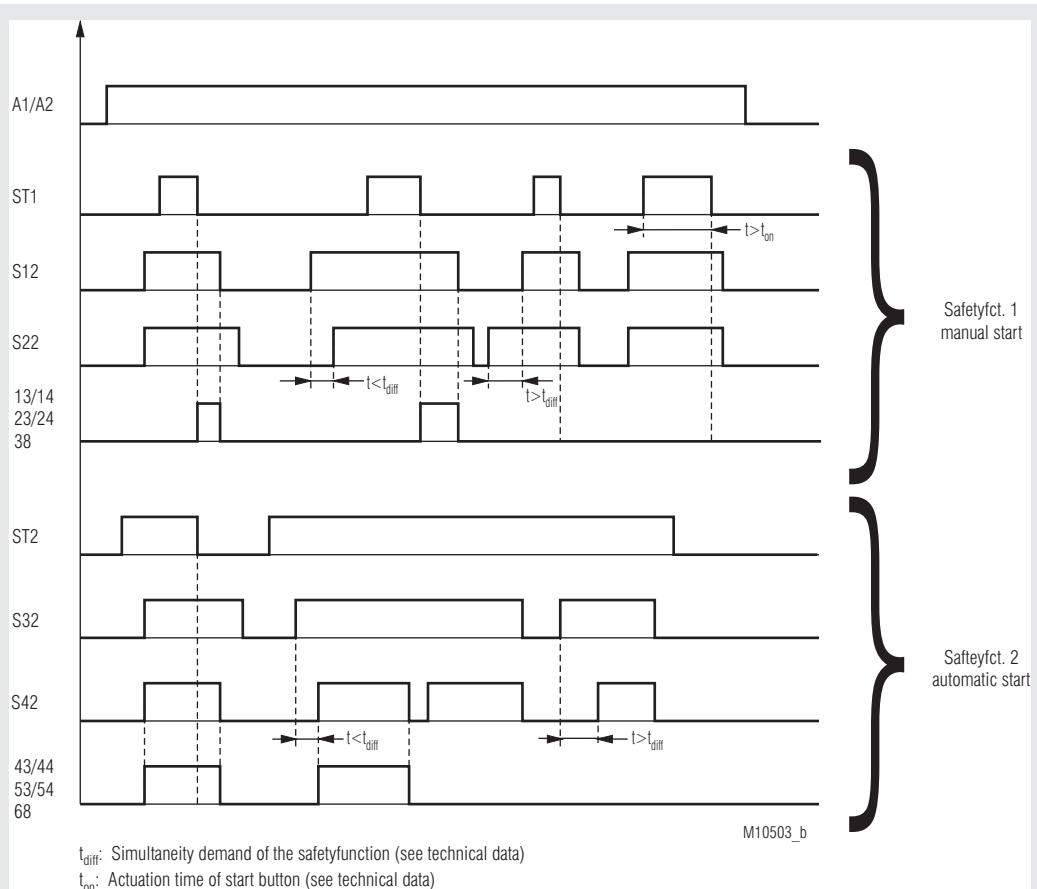

### Application

For enable and interrupt a safety circuit in a safe way. It can be used to protect people and machines in applications with e-stop buttons, safety gates, light curtains with selftesting (Type 4) acc. to IEC/EN 61 496-1, 2-hand controls for presses as well as other production machinery with dangerous closing action (Type III C to EN 574) and for safety mats, safety edges and tape switches with a max. switching current of 15 mA.

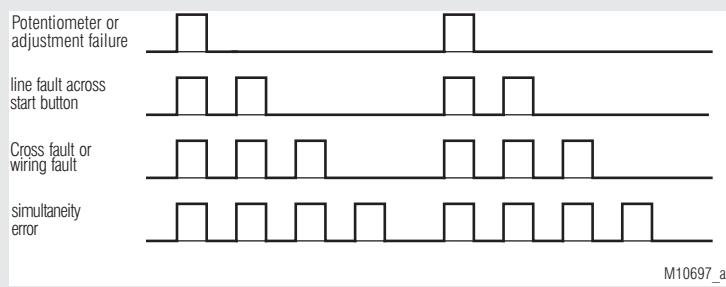

### Indicators

- |                  |   |
|------------------|---|
| green LED ON:    | on, when supply connected   |
| red LED ERR:     | on, at internal error<br>flashes at external error  |
| green LED K1/K2: | on, when relay K1 and K2 energized (safety function 1)<br>flashes at external errors of safety function 1 |
| green LED K3/K4: | on, when relay K3 and K4 energized (safety function 2)<br>flashes at external errors of safety function 2 |

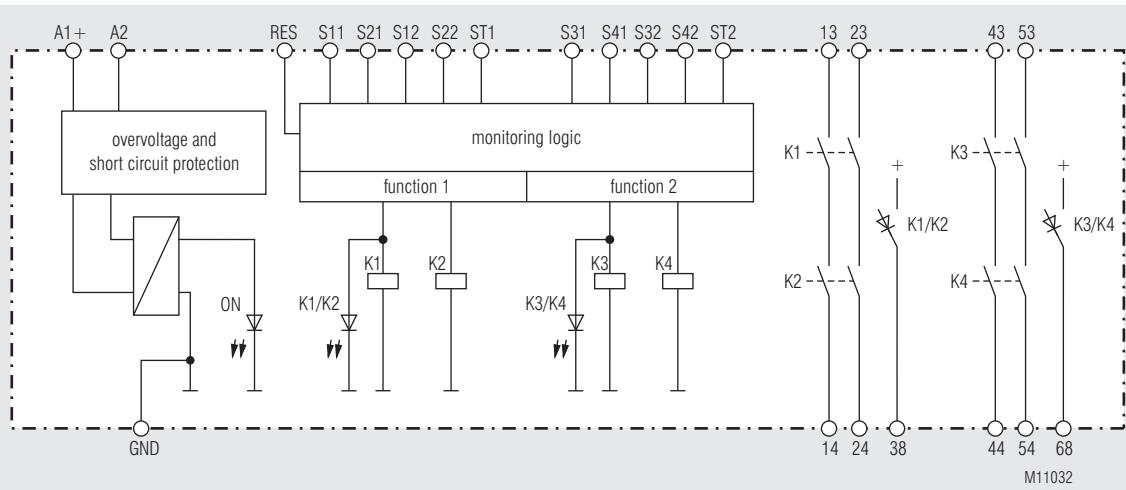

## Function Diagram

## Fault Indication by Flashing Code

## Block Diagram

## Practical Notes

### Operation mode

With the potentiometer on the front plate the operation mode can be adjusted. The adjustment must be required before energized. Adjustment during energization is not allowed. Only an automatic start at safety function two-hand control (3) is possible.

Start	Fkt. 1	Fkt. 2
1	MANUAL	MANUAL
2	MANUAL	AUTO
3	AUTO	HAND
4	AUTO	AUTO
5	MANUAL with common button	

### Line fault detection e.g. monitoring of ON-button

If the On-button pressed more than 3 s the adequate output contacts of the safety function can't be switch. The output contacts can be energized when the On-button pressed again ( $0.1 \text{ s} < t_{\text{ON}} < 3 \text{ s}$ ).

A line fault is detected if the On-button more than 10 s is actuated. The output contacts of the adequate safety function can only be energized with a reset or re-start with on an off switching of power supply.

### Reset and external failures:

The reset input is used to reset external failures (application failures or removable external failures as e.g. a line fault on reset button). If the reset signal is connected to the input for more than 3 sec the unit makes a reset. A new reset is only possible when the reset signal had been switched off temporarily.

If an external failure occurs because both input channels of a safety function did not switch on or off within the simultaneous time, a reset is only possible if both channels are switched to off state after removing failure cause.

If an external failure occurs in only one safety function, only this function will be disconnected. The second safety function still continuous to work.

### Function setting

The variants with selectable safety functions have 2 potentiometers Fkt.1 and Fkt.2 to select the required function. The following functions are possible:

Fkt. 1 / Fkt. 2	Safety function	
1	E-Stop	cross fault detection
2	Safety gate	
3	Two-hand control	
4	Safety mat / Safety edge	
5	Exclusive or contacts	
6	E-Stop	without cross fault detection
7	Safety gate	
8	Light curtain	

## Operating Potentiometer

Poti "t <sub>Fkt</sub> "	Adjustment of delay function
Poti "t <sub>max</sub> "	Adjustment of time range
Poti "t"	Fine adjustment at time range

## Technical Data

### Input

<b>Nominal voltage U<sub>N</sub>:</b>	DC 24 V
<b>Voltage range:</b>	0.8 ... 1.1 U <sub>N</sub>
<b>Nominal consumption:</b>	typ. 3.2 W
<b>Short-circuit protection:</b>	Internal PTC
<b>Oversupply protection:</b>	Internal VDR
<b>Duty-cycle ON button:</b>	0.1 s < t <sub>EIN</sub> < 3 s
<b>Duty-cycle Reset button:</b>	> 3 s

### Safety function

#### Safety mat / safety edge (4)

max. permitted safety edge contact resistance:	1000 Ω
switching current at short circuit:	typ. 15 mA at U <sub>N</sub>
<b>Light curtains (8)</b>	
control current via S12, S22	
e.g. S32, S42:	typ. 8 mA at U <sub>N</sub>
Min. voltage on terminals S12, S22 e.g. S32, S42	
when relay activated:	DC 10 V

### Output

#### Contacts

2 NO contacts per safety function

The NO contacts can be used for safe braking.

#### Thermal current Strom I<sub>th</sub>:

max. 8 A  
(see quadratic total current limit curve)

### Safety function

#### E-Stop (1) (6), Safety gate (2) (7),

#### Exclusive or contacts (5)

Start up at U <sub>N</sub> :	< 65 ms
Release delay at U <sub>N</sub> and disconnecting the supply:	< 40 ms
Release delay at U <sub>N</sub> and disconnecting S12,S22 or S32, S42:	< 60 ms
Simultaneity demand:	< 3 s

#### Two-hand control (3)

Start up at U <sub>N</sub> :	< 110 ms
Release delay at U <sub>N</sub> and disconnecting the supply:	< 40 ms
Release delay at U <sub>N</sub> and disconnecting S12,S22 or S32, S42:	< 60 ms
Simultaneity demand:	< 0,5 s

#### Safety mat (4)

Start up at U <sub>N</sub> :	< 85 ms
Release delay at U <sub>N</sub> and disconnecting the supply:	< 40 ms
Release delay at U <sub>N</sub> and disconnecting S12,S22 or S32, S42:	< 60 ms
Simultaneity demand:	< 0,5 s

#### Light curtains (8)

Start up at U <sub>N</sub> :	< 35 ms
Release delay at U <sub>N</sub> and disconnecting the supply:	< 40 ms
Release delay at U <sub>N</sub> and disconnecting S12,S22 or S32, S42:	< 25 ms
Simultaneity demand:	< 1 s

### Switching capacity

to AC 15	3 A / AC 230 V	IEC/EN 60 947-5-1
NO contacts:	2 A / DC 24 V	IEC/EN 60 947-5-1

### Electrical life

at 5 A, AC 230 V cos φ = 1: > 1.5 x 10<sup>5</sup> switching cycles

### Permissible operating frequency

1. safety function:	max. 1800 switching cycles / h
2. safety function:	max. 360 switching cycles / h

### Short circuit strength

max. fuse rating: 6 A gG /gL IEC/EN 60 947-5-1

10 x 10<sup>6</sup> switching cycles

### Semiconductor monitoring output

(not safety):	1 per safety function
	max. 50 mA DC 24 V, plus switching (see quadratic total current limit curve)

## Technical Data

### General Data

<b>Nominal operating mode:</b>	continuous operation
<b>Temperature range</b>	
Operation:	- 25 ... + 55 °C

Quadratic total current limit curve output contacts

$$\sum I = I_{38} + I_{68}$$

z.B. :  $\sum I = 35mA + 15mA = 50mA$

$I_{38}$  - current semiconductor output 38

$I_{68}$  - current semiconductor output 68

Quadratic total current limit curve semiconductor monitoring outputs

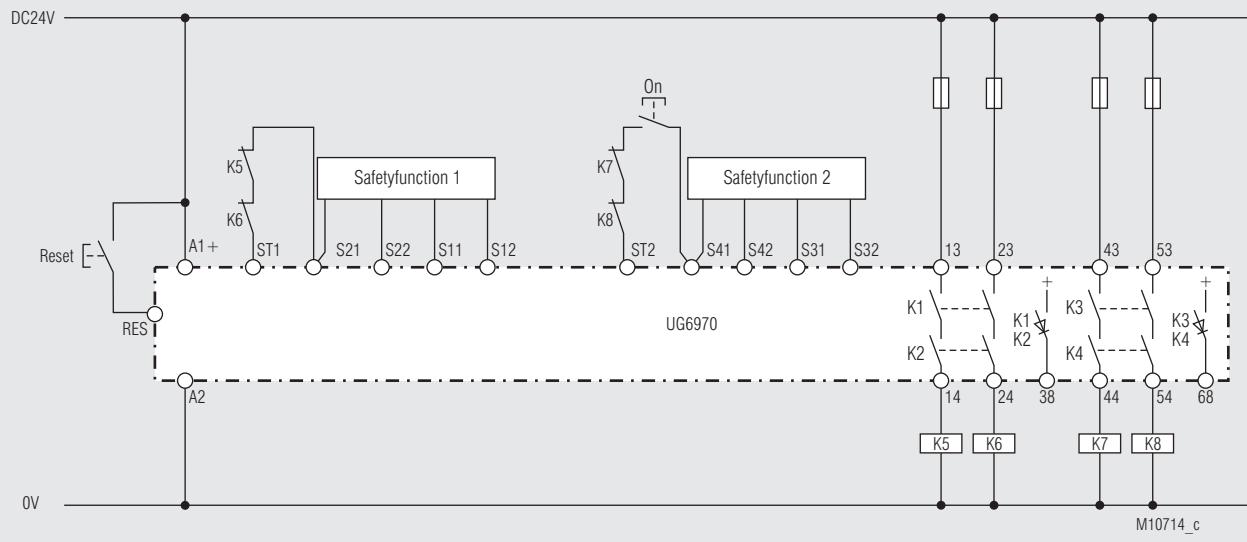

## Troubleshooting

Failure	Potential cause
LED "ON" does not light up	- Power supply A1+/A2 not connected
LED "ERR" flashes in relation 1:1	- Under- or overvoltage (check power supply A1+/A2)
LED "ERR" flashes in relation 4:1	- external failure (see flashing code)
LED "ERR" continuously on	- system error (if cannot be removed after restart unit must be replaced)

## Maintenance and Repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

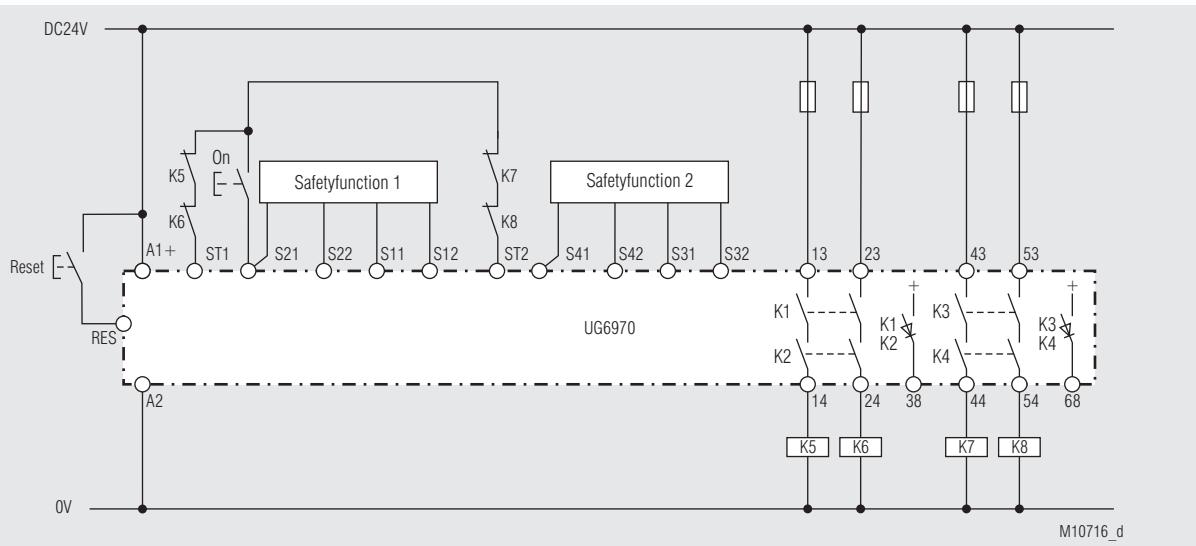

## Application Examples with safety function

Operating mode: 3 (Fkt1=AUTO ; Fkt2=MANUAL)

Safety function 1: see page 7, Auto-Start

Safety function 2: see page 7, Manual-Start

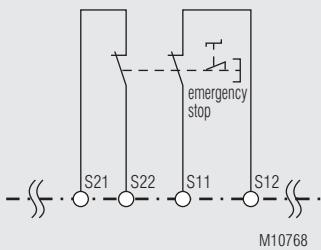

Operating mode: 5 (MANUAL with common button)

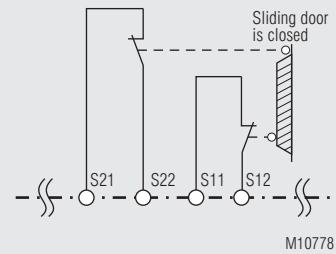

Safety function 1: see page 7, Manual-start with common button

Safety function 2: see page 7, Manual-start with common button

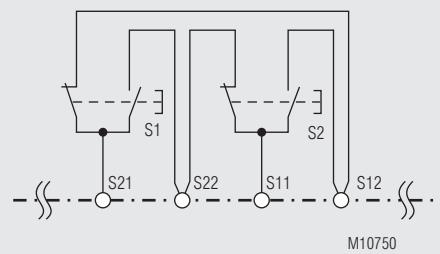

## Application Examples with safety function 1

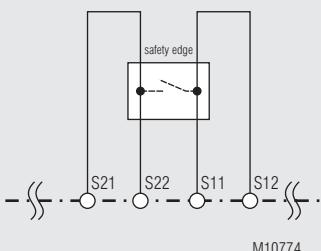

Fct.: E-stop (1),  
with cross fault detection  
SIL 3, PL e, Cat. 4

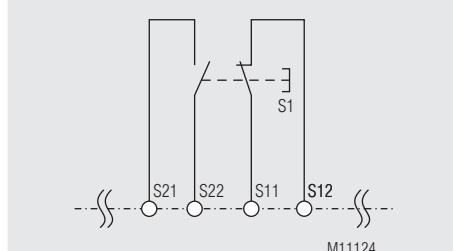

Fct.: Safety gate (2),  
with cross fault detection  
SIL 3, PL e, Cat. 4

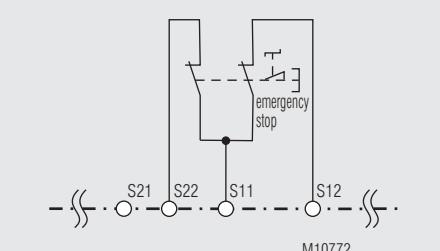

Fct.: Two-hand control (3),  
with cross fault detection  
SIL 3, PL e, Cat. 4  
Type III C to EN 574

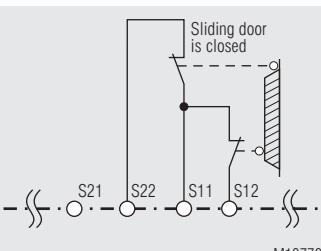

Fct.: Safety mat / Safety edge (4),  
with cross fault detection  
SIL 3, PL e, Cat. 4

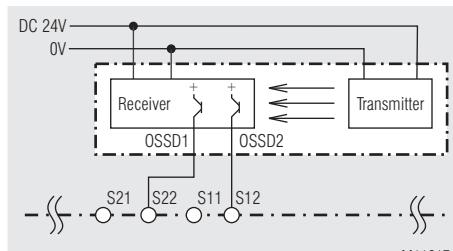

Fct.: Exclusive or contacts (5),  
with cross fault detection  
SIL 3, PL e, Kat. 4

Fct.: E-Stop (6),  
without cross fault detection  
SIL 3, PL e, Cat. 4<sup>1)</sup>

Fct.: Safety gate (7),  
without cross fault detection  
SIL 3, PL e, Cat. 4<sup>1)</sup>

Fct.: Light curtain (8),  
without cross fault detection  
SIL 3, PL e, Cat. 4<sup>2)</sup>

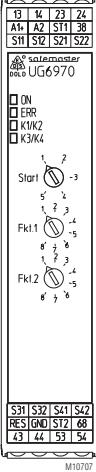

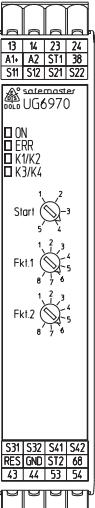

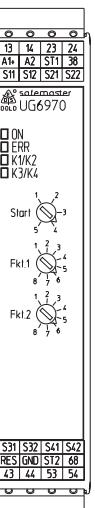

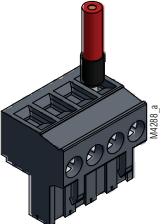

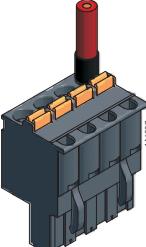

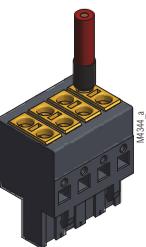

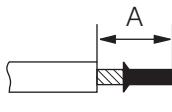

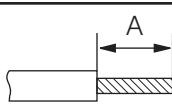

<sup>1)</sup> To achieve the stated safety classification the wiring has to be done with crossfault monitoring.

<sup>2)</sup> To achieve the stated safety classification light curtains with selftest (type 4) according to IEC/EN 61496-1 have to be used.

## Application Examples with safety function 2

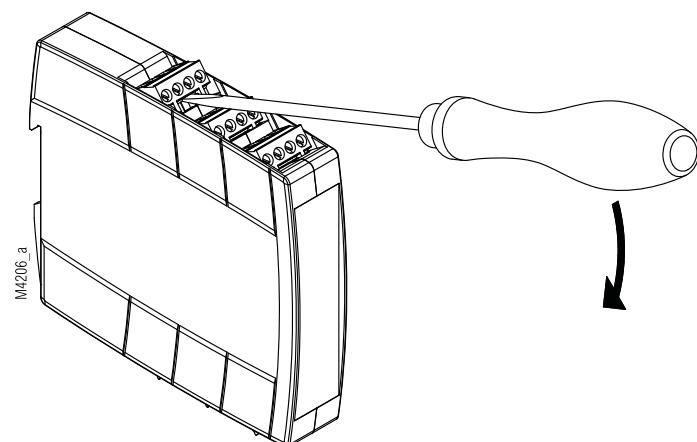

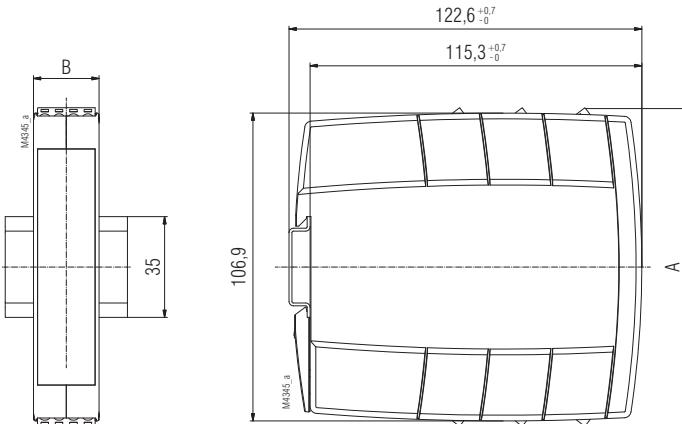

The safety function 2 is connected as well as safety function 1, but S11 ≈ S31, S12 ≈ S32, S21 ≈ S41 and S22 ≈ S42.

## SAFEMASTER C Multifunctional Safety Module UG 6980

**DOLD** 

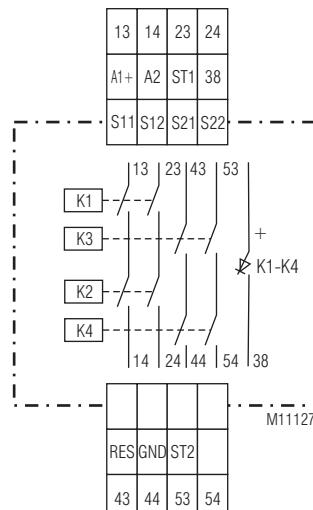

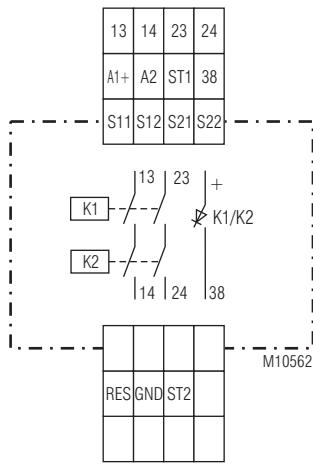

0269011

### Product Description

The multifunctional safety module UG 6980 provides protection of men and machines by enabling and disabling a safety circuit. It is used together with e-stop buttons, safety gates, light curtains with self testing (type 4) to IEC/EN 61496-1, 2-hand buttons on presses for metal processing and productions machines with dangerous closing movements (type III C to EN 574) and safety mats, edges and tape switches. Simply select 1 out of 5 safety functions on rotary switches - ready. This reduces divers types of safety modules in stock and simplifies your disposition.

### Circuit Diagram

### Your Advantage

- **Adjustable safety functions:**
  - E-Stop
  - Safety gate
  - Two-hand control
  - Safety mat / Safety edge
  - Exclusive or contacts
  - Light curtain
- Manual or auto start
- Only one device, different safety functions
- Protection against manipulation by sealable transparent cover

### Features

- **According to**
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508 and IEC/EN 61511
- Acc. to EN 50156-1 for furnaces
- Line fault detection on On-button:
- Manual restart or automatic restart
- With or without cross fault monitoring
- 2-channel
- Forcibly guided output contacts
- Output: max. 4 NO instantaneous semiconductor monitoring output
- LED indicator for operation, delay contexts and failure
- As option with pluggable terminal blocks for easy exchange of devices
  - with screw terminals
  - or with cage clamp terminals
- Width: 22.5 mm

### Approvals and Markings

### Application

Protection of people and machines

- Emergency stop circuits on machines
- Monitoring of position switches on a safety gate
- Switch gear (FSD) for light bars with selftest (type 4) according to IEC/EN 61 496-1
- 2-hand controls for presses as well as other production machinery with dangerous closing action (Type III C to EN 574)
- Switch gear for safety mats, safety edges and tape switches with a max. switching current of 15 mA.

### Indicators

green LED ON: on, when supply connected

red LED ERR: on, at internal error  
flashes at external error

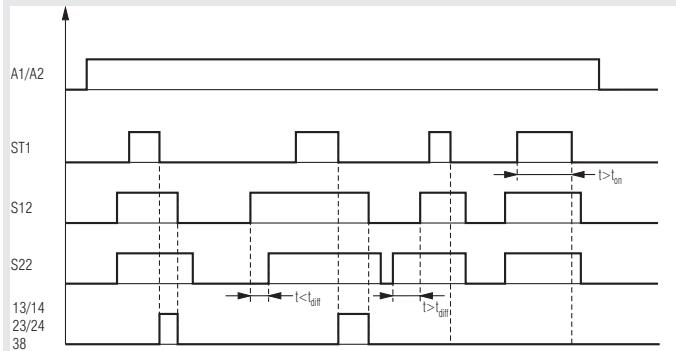

green LED K1/K2 (.02)  
e.g. K1-K4 (.04):

on, when relay K1 and K2 (.02)  
energized, e.g. when relay  
K1, K2, K3 and K4 (.04) energized  
flashes at external error

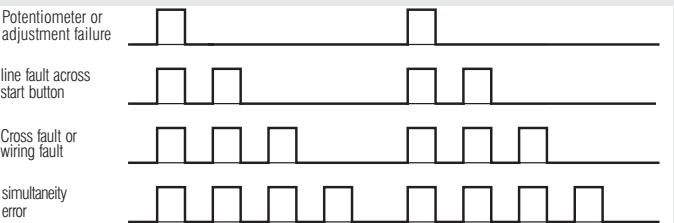

### Connection Terminals

Terminal designation	Signal description
A1 +	DC 24 V
A2	0 V
13, 14, 23, 24, 43, 44, 53, 54	Forcibly guided NO contacts for release circuit
38	Semiconductor monitoring output
GND	Reference potential for Semiconductor monitoring output
S11, S21	control output
S12, S22, ST1, ST2, RES	control input

## Function Diagram

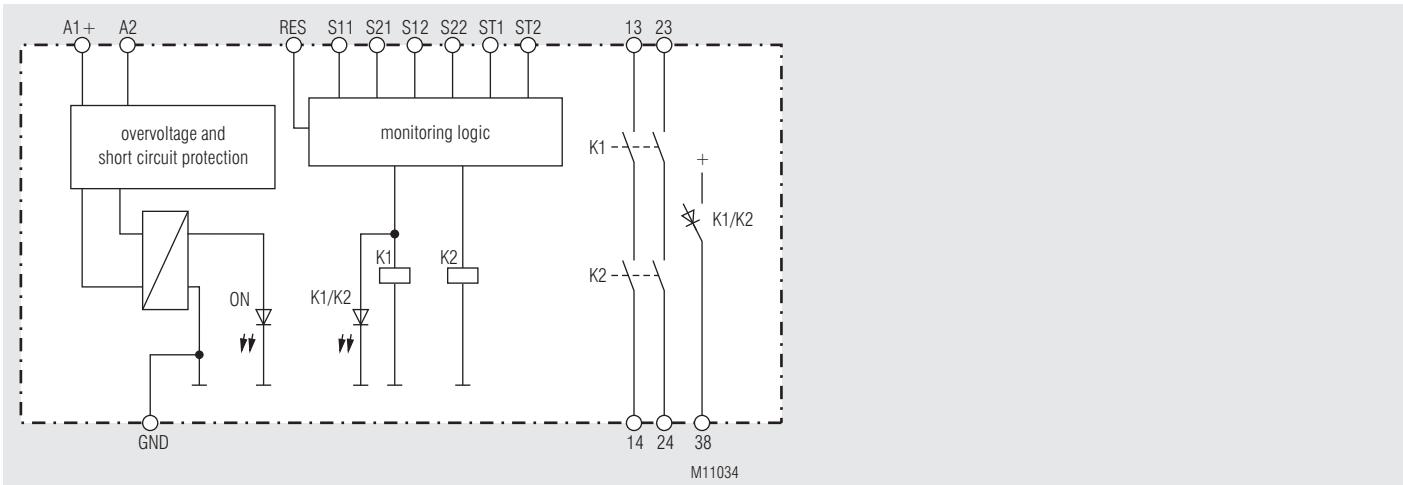

## Fault Indication by Flashing Code

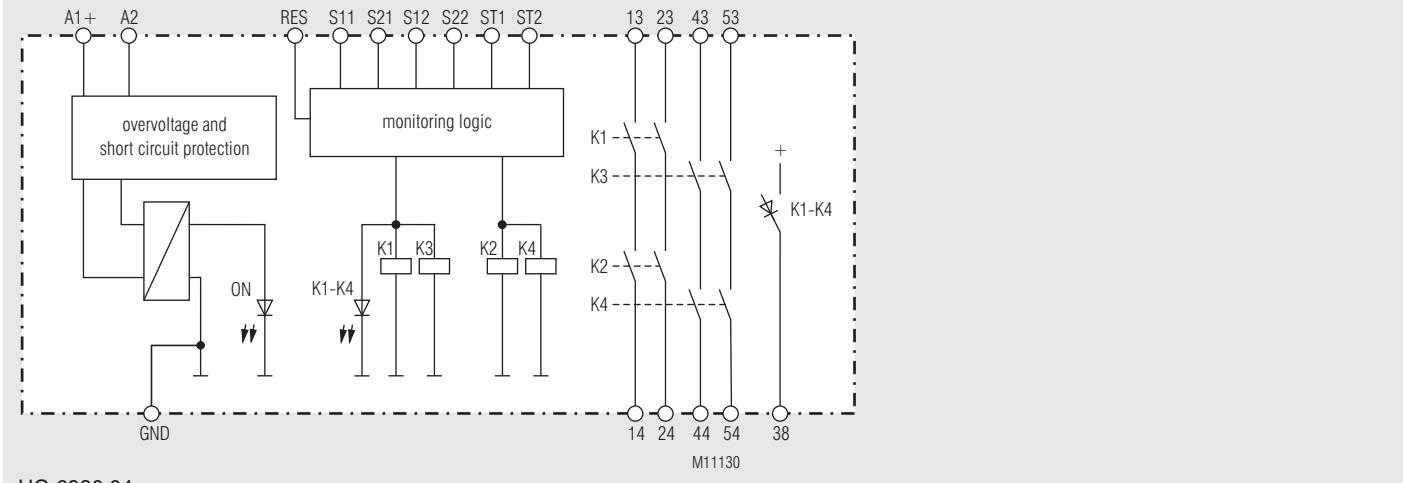

M10697\_a

$t_{\text{diff}}$ : Simultaneity demand of the safetyfunction (see technical data)  
 $t_{\text{on}}$ : Actuation time of start button (see technical data)

## Block Diagrams

UG 6980.02

UG 6980.04

## Practical Notes

### Operating mode

Manual or auto start is chosen by wiring. On manual start S21 has to be connected to ST1! via an NO push button. For auto start S21 is connected to ST2. If both inputs are connected to S21 the unit goes into safe failure mode. A restart or new start of the device has to be made. When selecting the safety function 2-hand control (3), only automatic start is possible.

### Line fault detection e.g. monitoring of ON-button

If the On-button pressed more than 3 s the adequate output contacts of the safety function can't be switch. The output contacts can be energized when the On-button pressed again ( $0.1 \text{ s} < t_{\text{ON}} < 3 \text{ s}$ ).

A line fault is detected if the On-button more than 10 s is actuated. The output contacts of the adequate safety function can only be energized with a reset or re-start with on an off switching of power supply.

### Reset and external failures:

The reset input is used to reset external failures (application failures or removable external failures as e.g. a line fault on reset button). If the reset signal is connected to the input for more than 3 sec the unit makes a reset. A new reset is only possible when the reset signal had been switched off temporarily.

If an external failure occurs because both input channels of a safety function did not switch on or off within the simultaneous time, a reset is only possible if both channels are switched to off state after removing failure cause.

### Setting

On the variant /0\_ \_ the safety function can be set via rotary switch.

Possible functions:

Fct.	Safety function	
1	E-Stop	cross fault detection
2	Safety gate	
3	Two-hand control	
4	Safety mat / Safety edge	
5	Exclusive or contacts	
6	E-Stop	without cross fault detection
7	Safety gate	
8	Light curtain	

## Operating Potentiometer

Poti "Fkt"

Adjustment of safety function

## Technical Data

### Input

<b>Nominal voltage <math>U_N</math>:</b>	DC 24 V
<b>Voltage range:</b>	0.8 ... 1.1 $U_N$
<b>Nominal consumption:</b>	typ. 1.9 W
<b>Short-circuit protection:</b>	Internal PTC
<b>Oversupply protection:</b>	Internal VDR
<b>Duty-cycle ON button:</b>	$0.1 \text{ s} < t_{\text{EIN}} < 3 \text{ s}$
<b>Duty-cycle Reset button:</b>	$> 3 \text{ s}$

### Safety function

#### Safety mat / safety edge (4)

max. permitted	safety edge contact resistance: 1000 $\Omega$
	switching current at short circuit: typ. 15 mA at $U_N$
	<b>Light curtains (8)</b>
	control current via S12, S22: typ. 8 mA at $U_N$

Min. voltage on terminals S12, S22 when relay activated: DC 10 V

### Output

#### Contacts

UG 6980.02	2 NO contacts
UG 6980.04	4 NO contacts

The NO contacts can be used for safe braking.

#### Thermal current $I_{\text{th}}$ :

max. 8 A  
(see quadratic total current limit curve)

### Safety function

#### E-Stop (1) (6), Safety gate (2) (7),

#### Exclusive or contacts (5)

Start up at $U_N$ :	< 65 ms
Release delay at $U_N$ and disconnecting the supply:	< 40 ms
Release delay at $U_N$ and disconnecting S12,S22:	< 60 ms
Simultaneity demand:	< 3 s

#### Two-hand control (3)

Start up at $U_N$ :	< 110 ms
Release delay at $U_N$ and disconnecting the supply:	< 40 ms
Release delay at $U_N$ and disconnecting S12,S22:	< 60 ms
Simultaneity demand:	< 0,5 s

#### Safety mat (4)

Start up at $U_N$ :	< 85 ms
Release delay at $U_N$ and disconnecting the supply:	< 40 ms
Release delay at $U_N$ and disconnecting S12,S22:	< 60 ms

#### Light curtains (8)

Start up at $U_N$ :	< 35 ms
Release delay at $U_N$ and disconnecting the supply:	< 40 ms
Release delay at $U_N$ and disconnecting S12,S22:	< 25 ms
Simultaneity demand:	< 1 s

#### Switching capacity

to AC 15  
NO contacts: 3 A / AC 230 V IEC/EN 60 947-5-1

to DC 13  
NO contacts: 2 A / DC 24 V IEC/EN 60 947-5-1

#### Electrical life

at 5 A, AC 230 V cos  $\phi = 1$ :  $> 2.2 \times 10^5$  switching cycles

**Perm. operating frequency:** max. 1800 switching cycles / h

#### Short circuit strength

max. fuse rating: 6 A gG / gL IEC/EN 60 947-5-1

**Mechanical life:**  $10 \times 10^6$  switching cycles

**Semiconductor monitoring output (not safety):** max. 50 mA DC 24 V, plus switching

## Technical Data

### General Data

<b>Nominal operating mode:</b>	continuous operation
<b>Temperature range</b>	
Operation:	- 25 ... + 55 °C
Storage:	- 25 ... + 85 °C
<b>Altitude:</b>	< 2.000 m
<b>Clearance and creepage distance</b>	
rated impulse voltage / pollution degree:	4 kV / 2 IEC 60 664-1
<b>EMC</b>	IEC/EN 61 326-3-1, IEC/EN 62 061
<b>Interference suppression:</b>	Limit value class B EN 55 011
<b>Degree of protection</b>	
Housing:	IP 40 IEC/EN 60 529
Terminals:	IP 20 IEC/EN 60 529
<b>Housing:</b>	thermoplastic with VO behaviour according to UL subj. 94
<b>Vibration resistance:</b>	Amplitude 0,35 mm
<b>Klimate resistance:</b>	Frequency 10 ... 55 Hz, IEC/EN 60 068-2-6
<b>Terminal designation:</b>	25 / 055 / 04 IEC/EN 60 068-1
<b>Wire fixing:</b>	EN 50 005 captive slotted screw or cage clamp terminals
<b>Mounting:</b>	DIN rail IEC/EN 60 715
<b>Weight:</b>	approx. 210 g

### Dimensions

<b>Width x height x depth:</b>	22.5 x 110 x 120.3 mm
UG 6980 PS:	22.5 x 120 x 120.3 mm

## UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL 508, "general use applications"

**Ambient temperature:** - 15 ... + 55 °C

**Switching capacity for .02:** Pilot duty B300, Q300  
8A 250Vac Resistive or G.P.  
8A 24Vdc Resistive

**Switching capacity for .04**  
Ambient temperature 55°C  
Pilot duty B300, Q300  
5A 250Vac Resistive or G.P.  
5A 24Vdc Resistive

Ambient temperature 40°C:  
Pilot duty B300, Q300  
8A 250Vac Resistive or G.P.  
8A 24Vdc G.P.

**Wire connection:** 60°C / 75°C copper conductors only  
PS-terminal: AWG 28 - 12 Sol/Str Torque 0.5 Nm  
PC-terminal: AWG 24 - 12 Sol/Str  
PT-terminal: AWG 24 - 16 Sol/str

Technical data that is not stated in the UL-Data, can be found in the technical data section.

### Standard Type

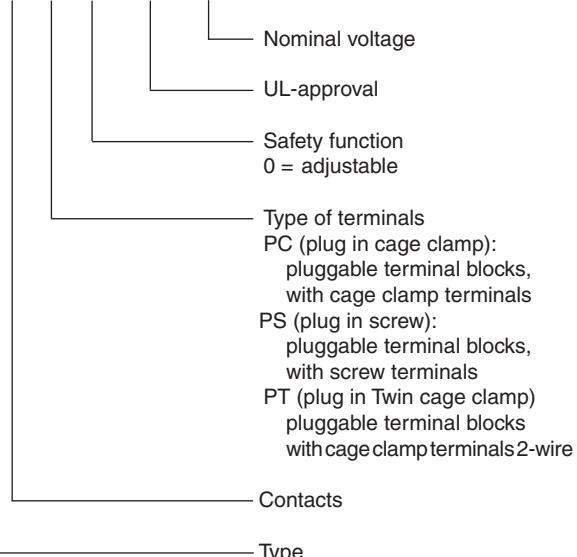

UG 6970.04PS/61 DC24V

Article number: 0065426

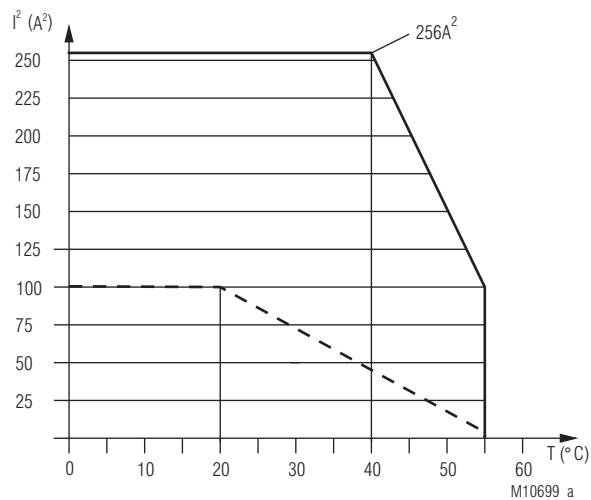

- 1<sup>st</sup> Safety function: adjustable
- 2<sup>nd</sup> Safety function: adjustable
- Output: 2 NO contacts per safety function
- Nominal voltage: DC 24 V
- Width: 22.5 mm

## Variants

UG 6980 ... / ... 00 /61 DC 24 V

## Characteristics

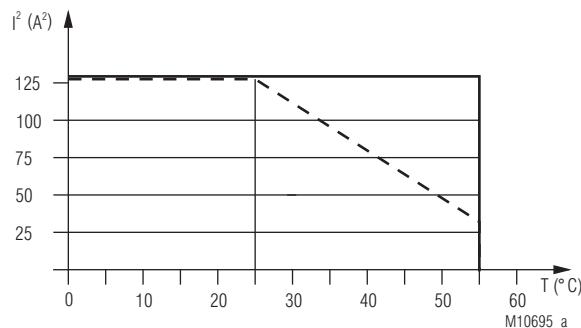

device free-standing  
max. current at 55°C over  
4 contact path = 5A  $\cong 4 \times 5^2 A^2 = 100 A^2$

device mounted without distance heated by  
devices with same load,  
max. current at 55°C over  
4 contact path = 1A  $\cong 4 \times 1^2 A^2 = 4 A^2$

$$\Sigma I^2 = I_1^2 + I_2^2 + I_3^2 + I_4^2$$

$I_1, I_2, I_3, I_4$  - current in contact paths

UG 6980.04  
Quadratic total current limit curve

device free-standing  
max. current at 55°C over  
2 contact path = 8A  $\cong 2 \times 8^2 A^2 = 128 A^2$

device mounted without distance heated by  
devices with same load,  
max. current at 55°C over  
2 contact path = 4A  $\cong 2 \times 4^2 A^2 = 32 A^2$

$$\Sigma I^2 = I_1^2 + I_2^2$$

$I_1, I_2$  - current in contact paths

UG 6980.02  
Quadratic total current limit curve

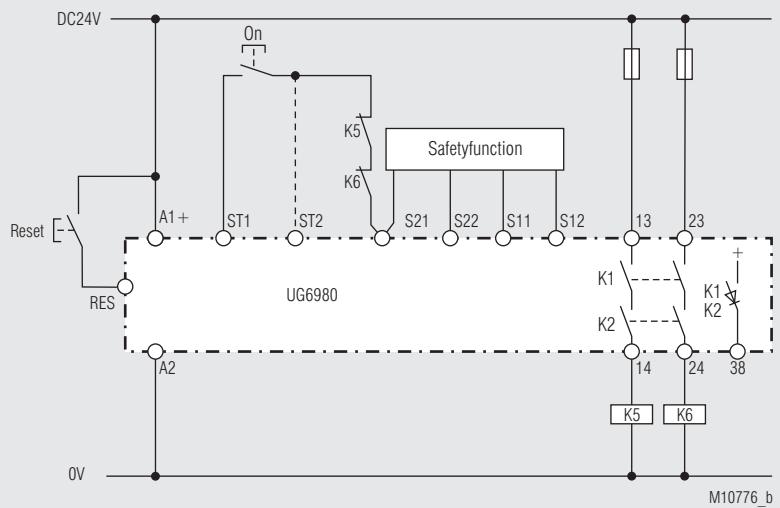

## Troubleshooting

Failure	Potential cause
LED "ON" does not light up	- Power supply A1+/A2 not connected
LED "ERR" flashes in relation 1:1	- Under- or overvoltage (check power supply A1+/A2)
LED "ERR" flashes in relation 4:1	- external failure (see flashing code)
LED "ERR" continuously on	- system error (if cannot be removed after restart unit must be replaced)

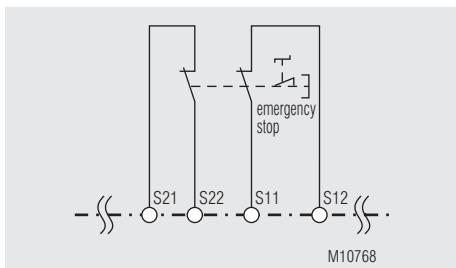

## Maintenance and Repairs

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

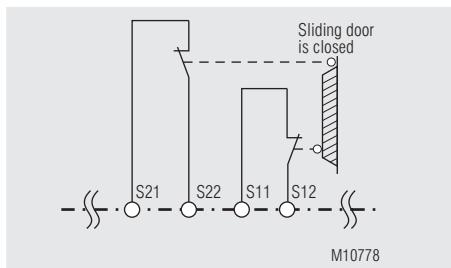

## Application Examples with safety function

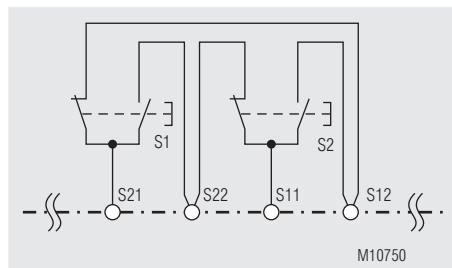

Safetyfunction: see below, Manual-Start (for automatic start make a bridge to ST2 instead of ON button).

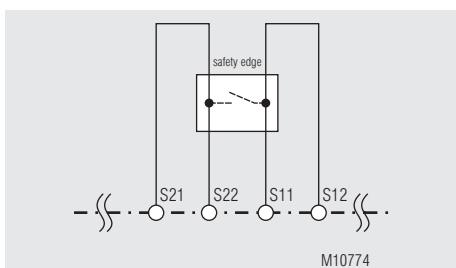

Fct.: E-stop (1),  
with cross fault detection  
SIL 3, PL e, Cat. 4

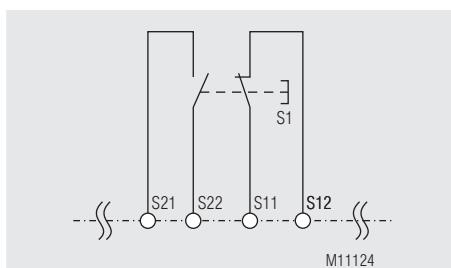

Fct.: Safety gate (2),  
with cross fault detection  
SIL 3, PL e, Cat. 4

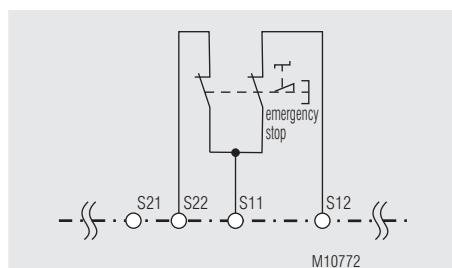

Fct.: Two-hand control (3),  
with cross fault detection  
SIL 3, PL e, Cat. 4  
Type III C to EN 574

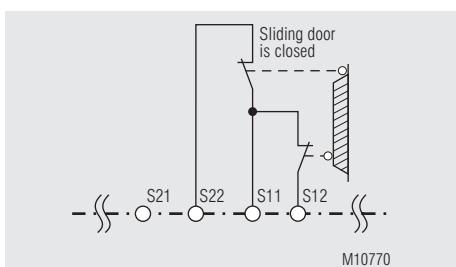

Fct.: Safety mat / Safety edge (4),  
with cross fault detection  
SIL 3, PL e, Cat. 4

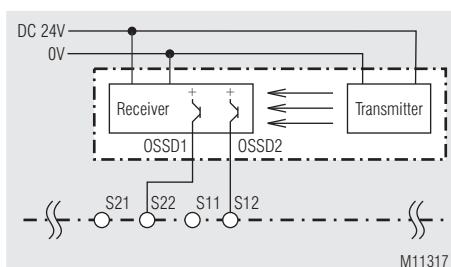

Fct.: Exclusive or contacts (5),  
with cross fault detection  
SIL 3, PL e, Kat. 4

Fct.: E-Stop (6),  
without cross fault detection  
SIL 3, PL e, Cat. 4<sup>1)</sup>

Fct.: Safety gate (7),  
without cross fault detection  
SIL 3, PL e, Cat. 4<sup>1)</sup>

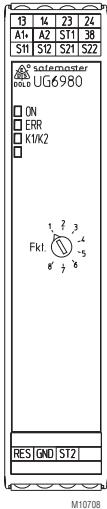

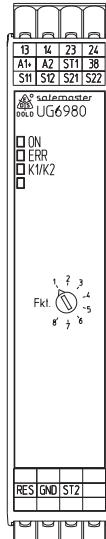

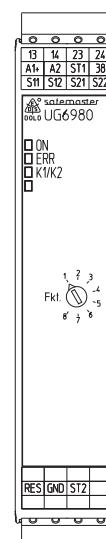

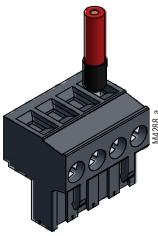

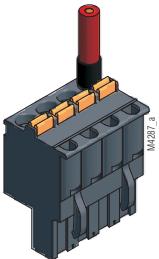

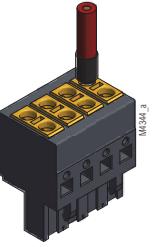

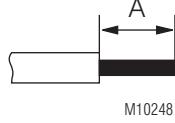

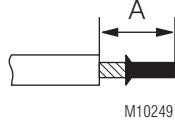

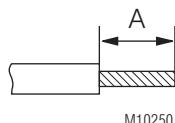

Fct.: Light curtain (8),  
without cross fault detection  
SIL 3, PL e, Cat. 4<sup>2)</sup>

<sup>1)</sup> To achieve the stated safety classification the wiring has to be done with crossfault monitoring.

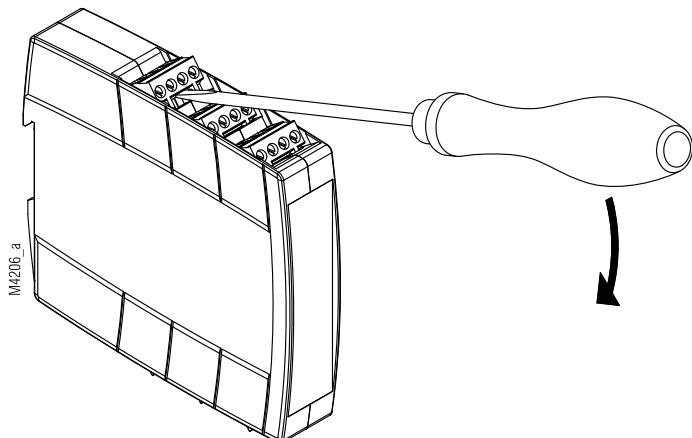

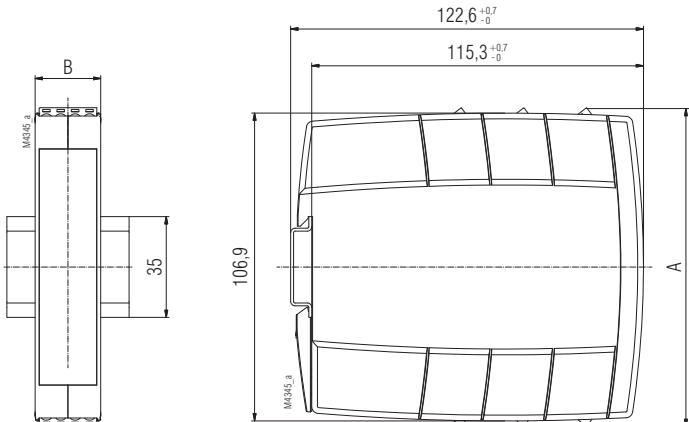

<sup>2)</sup> To achieve the stated safety classification light curtains with selftest (type 4) according to IEC/EN 61496-1 have to be used.

- Category 4 to EN 954-1

### • Functions selectable via rotational switches to connect max.:

- 8 E-stop circuits, single channel or
- 4 E-stop circuits, 2-channel or
- 4 light curtains or
- 2 light curtains and 1 E-stop circuit or
- 4 safety gates or
- 2 safety gates and 1 E-stop circuit or
- 4 pairs of 2-hand-buttons or Typ III A according to DIN EN 547 or
- 2 pairs of 2-hand-buttons Typ III C according to DIN EN 547 and 1 E-stop circuit

### • In addition selectable:

- auto or manual reset (simulation input for gate monitor)
- continuously monitored feedback circuit to monitor external contactors

### • Cross fault detection

### • Short circuit and broken wire detection

### • Outputs:

- 3 NO or 2 NO and 1 NC contacts
- 2 semiconductor outputs short circuit proof and overload protected
  - Under- and overvoltage detection and signalling

### • LED indication for operation (RUN), channel 1/2

### • 45 mm width

### Approvals and Markings

\* see variants

### Applications

- Protection of men and machines

### Indicators

lower green LEDs K1, K2: On, when relays K1 and K2 are energized

upper yellow LEDs run 1, run 2: Continuously on on fault free operation. Regular flashing when waiting for external action e.g. release of an E-stop button. Detected faults are indicated with special flashing sequences (see flash codes for fault indication)

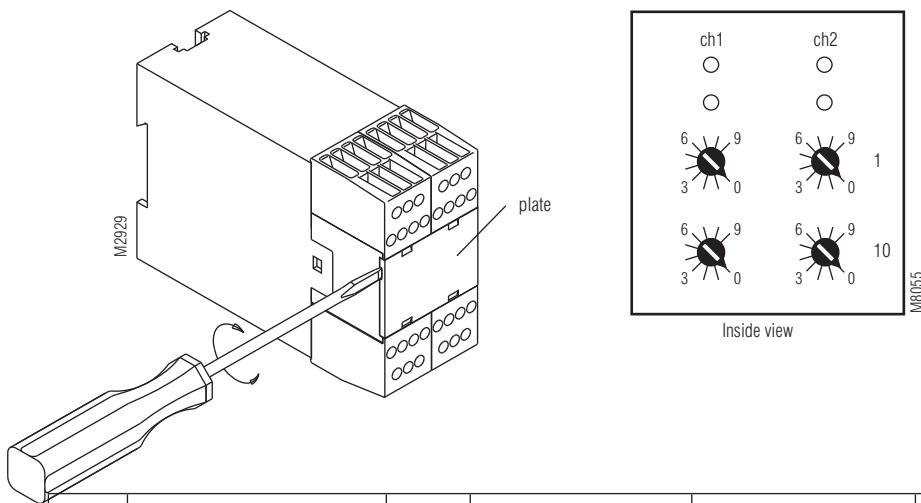

Terminal 48: Flashes, als long as starting condition is not fulfilled.

Terminal 58: Flashes while waiting for start or simulation input(button). Continuous signal when relay enabled.

### Notes

- On BH 5910.22 the NC contact 31 - 32 can only be used as monitoring contact.
- Changes of settings are only permitted when supply voltage is disconnected and have to be made by trained persons only.
- Before removing the front cover please touch ground potential.

## Setting

The selection of the function of BH 5910 is done via 4 rotational switches behind the front cover of the unit (see drawing on the left). The 2 switches on the left set processor 1 (ch 1) and the 2 switches on the right set processor 2 (ch 2). Both processors must have the same setting. On both upper switches (1) the function is selected, on both lower switches (10) the number of sensor circuits, control and operation mode and the feed back circuit option is selected.

Switch 1	Function	Switch 1	No / Sensors	Control mode	Operation mode	Feedback circuit for external contacts
0	E-stop	0	4	2 channel	Auto-Start	no
		1	3	2 channel	Manual start	no
		2	8	1 channel	Auto-Start	no
		3	6 E-stop button	1 channel	Manual start	no
		4	3	2 channel	Auto-Start	yes
		5	3	2 channel	Manual start	yes
		6	6	1 channel	Auto-Start	yes
		7	6	1 channel	Manual start	yes
1	Light curtains (LC)	0	4	2 channel	Auto-Start	no
		1	3 Light curtains	2 channel	Manual start	no
		2	3	2 channel	Auto-Start	yes
		3	3	2 channel	Manual start	yes

		5	1	2 C/O contacts		yes
7	not permitted					
8	not permitted					

## Operation Modes

### • Auto start

(with function E-stop and light curtain)

On automatic restart the output contacts are activated when the input condition for the selected function is fulfilled.

A start-button is only necessary in 2 cases:

- If the function light curtain, safety gate or 2-hand-safety is combined with E-stop.
- If a function with feedback circuit is selected and the unit has to be reset after a detected fault without disconnection.

If the number of contacts has to be increased or a higher current has to be switched by contactors a feedback circuit with NC contactors can be connected to terminals S41-S42 (see drawing 1). This circuit allows to monitor the state of the external contactors. The BH 5910 monitors continuously if the state of this input corresponds to the state of K1 and K2.

In the case of a fault K1 and K2 switch off or do not switch on at all. If the fault is removed, the BH 5910 has to be reset with the start button.

**When operating the unit with feedback circuit the circuit has to be connected to terminal S41 and S42.**

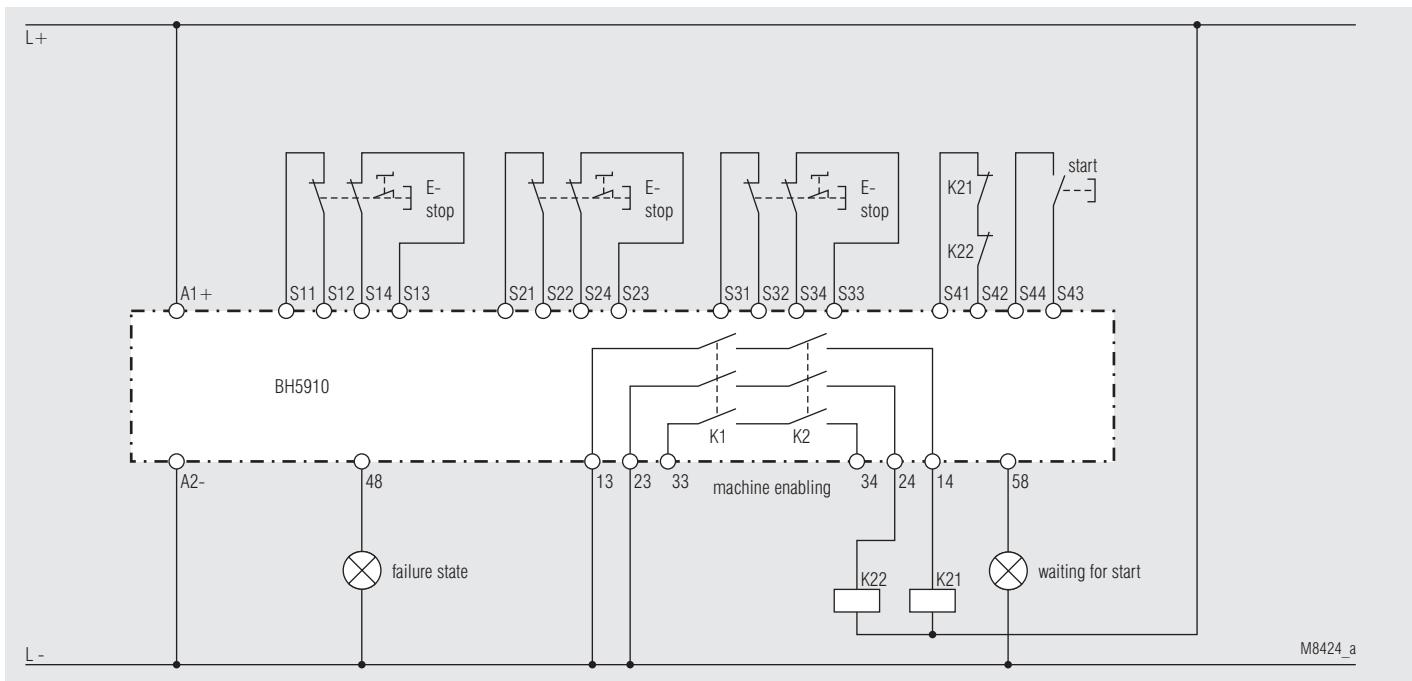

### • Manual start

(with function E-stop and light curtain)

If the unit was deactivated by operating the safety function e.g. by pressing an e-stop button it only can be reset in manual mode by pressing the start button. After voltage failure the unit has to be reset also with the start button. The button has to be pressed not longer than 3 sec. to allow the unit to energise.

**If one of the functions light curtain, safety gate or 2-hand-safety is combined with E-stop the E-stop function always works with manual restart.**

**When manual start is selected, the start button is always connected to terminals S43-S44.**

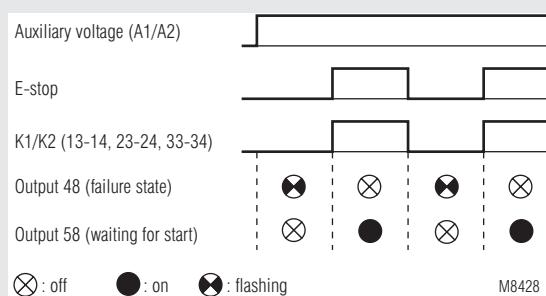

Pic. 1: E-stop, 2-channel, with 3 E-stop buttons, manual start and 2 external contactors with feed back circuits  
(Switch 1: position 0, switch 10: position 4 or 5)

## E-Stop (switch 1 in position 0)

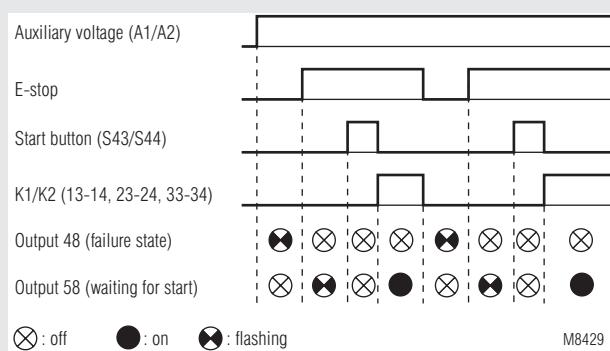

With switch 10 the maximum number of e-stop loops is selected. Open (unused) inputs (S\_1/S\_2 and S\_3/S\_4) have to be linked with a wire bridge. K1 and K2 can only be activated, if all e-stop buttons are released. The function diagrams show only the action of one e-stop button. We pretend that the others are closed.

When the unit is used with 2-channel e-stop loops, it checks the state of the inputs. If both channels have different signals for more than 50 ms the outputs K1 and K2 are switched off and the unit gives failure code 7. This failure is stored and can only be reset by disconnecting the auxiliary supply.

## Function Diagrams

E-stop, 2-channel, auto start

## E-Stop, Application Examples

Pic. 3: E-stop, 1-channel, with 8 e-stop loops, auto start; (switch 1 in position 0, switch 10 in position 2)

Pic. 4: E-stop, 2-channel, with 2 e-stop loops, manual start; (switch 1 in position 0; switch 10 in position 1)

### **Light Curtains (switch 1 in position 1)**

With switch 10 the maximum number of LCs (Light curtains) is selected. Open (unused) inputs (S\_1/S\_2 and S\_3/S\_4) have to be linked with a wire bridge.

K1 and K2 can only be activated, if no LC is interrupted.

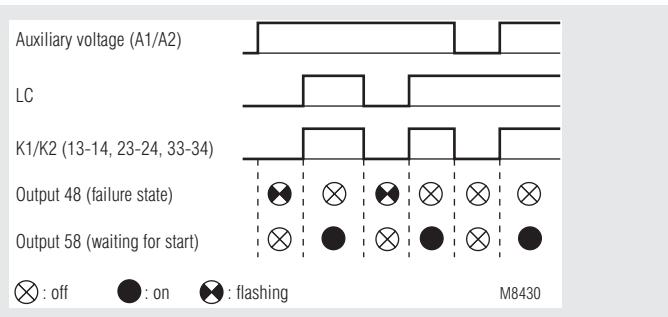

If both channels of an LC have different signals for more than 50 ms the outputs K1 and K2 are switched off and the unit gives failure code 7. This failure is stored and can only be reset by disconnecting the auxiliary supply. The BH 5910 can be used on LCs of type 4 (IEC/EN 61 496-1) or type 2 with self test and crossfault monitoring.

The following function diagrams show the function of one LC. We pretend that other connected LCs are not interrupted.

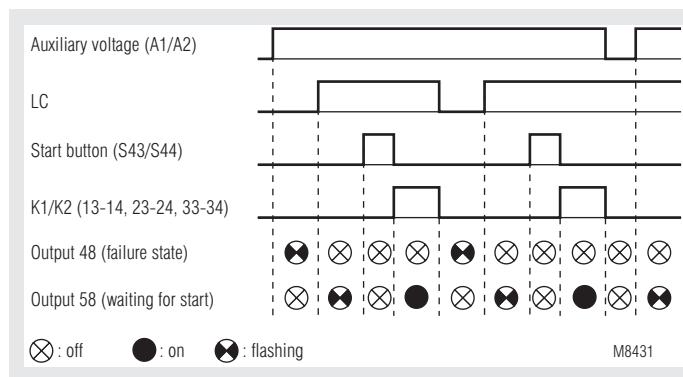

## **Settings on switch 10**

Switch 10	No. of LCs	Type of control	Type of start	Feedback circuit for external contactors
0	4	2-channel light curtains	Auto-Start	no
1	3	2-channel light curtains	Manual start	no
2	3	2-channel light curtains	Auto-Start	yes
3	3	2-channel light curtains	Manual start	yes
4-9	position not allowed (failure 5)

## Light Curtains (switch 1 in position 1); Application Example

Pic. 6: Light curtains, with 2 LCs, manual start; (switch 1 in position 1, switch 10 in position 1)

## Light Curtains and E-Stop (switch 1 in position 2)e

In this function the unit is always set to 2 LCs and 1 e-stop loop. Open (unused) inputs (S21/S22 and S23/S24) have to be linked with a wire bridge. K1 and K2 can only be activated, if no LC is interrupted and the e-stop loop is closed.

After an e-stop or power failure the unit has to be reset with manual start. If both channels of an LC or e-stop loop have different signals for more than 50 ms the outputs K1 and K2 are switched off and the unit gives failure code 7. This failure is stored and can only be reset by disconnecting the auxiliary supply.

### Settings on switch 10

Switch 10	No. of LCs	Type of control	Type of start	Feedback circuit for external contactors
0	4	2-channel light curtains	Auto-Start	no
1	3	2-channel light curtains	Manual start	no
2	3	2-channel light curtains	Auto-Start	yes
3	3	2-channel light curtains	Manual start	yes
4-9	position not allowed (failure 5)			

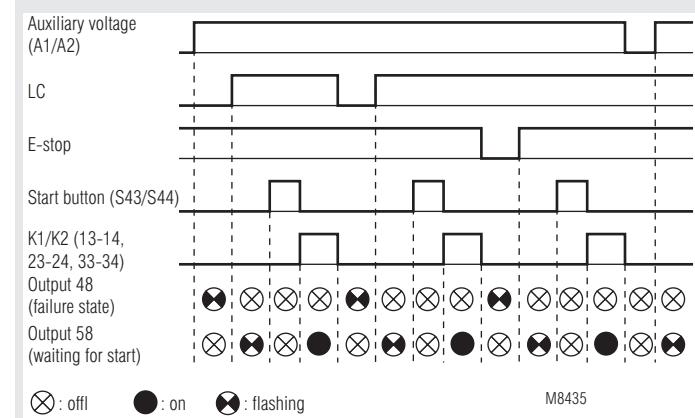

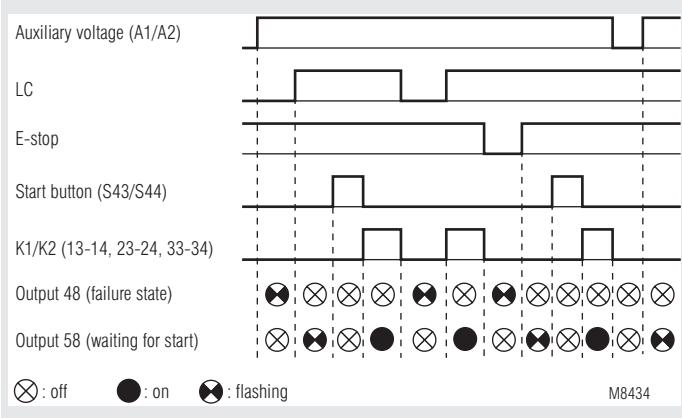

### Terminal designation

Terminal	Light curtains / E-stop		Feedback circuit for external contactors
S11 S12	not connected LC 1	link S11-S12 without LC1	
S13 S14	not connected LC 1	link S13-S14 without LC 1

58	Wait for start button	Relay K1, K2 active

## Light Curtains and E-Stop

Light curtains and E-stop, auto start

Light curtains and E-stop, manual start

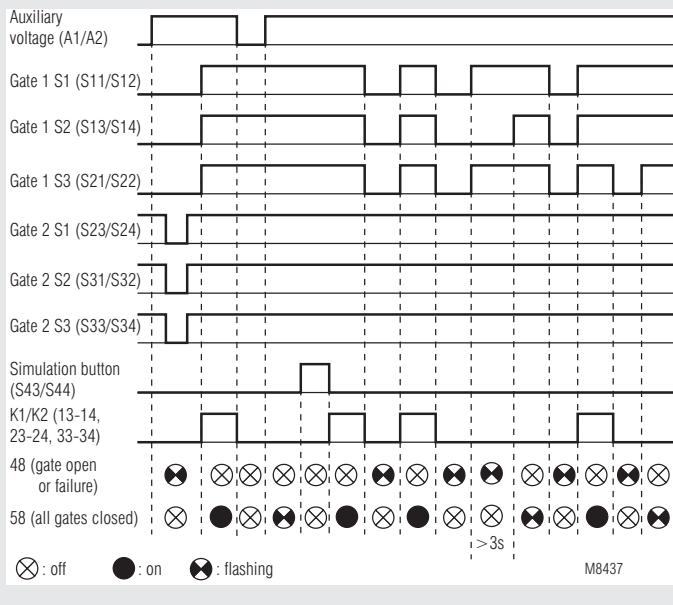

Pic. 7: Light curtains and E-stop, auto start or manual start (switch 1 in position 2, switch 10 in position 0 or 1)

## Safety Gates (switch 1 in position 3)

With switch 10 the maximum number of gates is selected. Open (unused) inputs (S\_1/S\_2 and S\_3/S\_4) have to be linked with a wire bridge. If gate inputs are not used the type of control has to be with simulation button. K1 and K2 can only be activated, if all connected gates have been opened and closed again. Both gate contacts have to be operated within 3 s. If the time difference is longer, the gate has to be opened before it can be closed again. When all gates are closed the unit can also be activated by an external connected Simulation button.

If changeover contacts are used on the gate switches the switchover time has to be less than 50 ms. If it is longer the outputs K1 and K2 are switched off and the unit gives failure code 7. This failure is stored and can only be reset by disconnecting the auxiliary supply.

## Function Diagram

## Settings on switch 10

Switch 10	Number of gates	Number and type of gate switches	Simulation button	Feedback circuit for external contactors
0	4	2 NO contacts	no	no
1	3	2 NO contacts	yes	no
2	2	2 C/O contacts	no	no

Gate monitor, 2 gates with 3 NO contacts for each gate, Simulation button

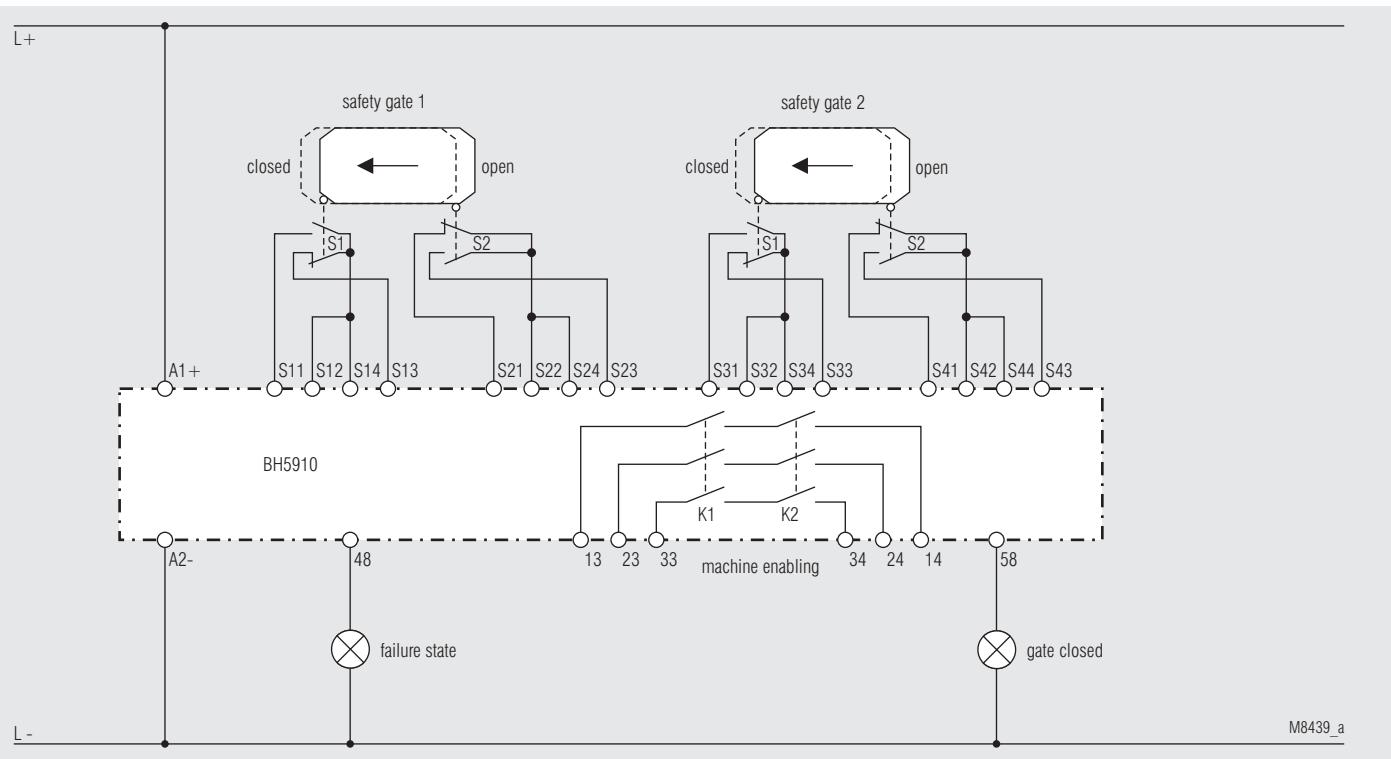

## Semiconductor outputs

Output	Flashing signal	Continuous signal
48	Open gate or failure in feedback circuit or in start circuit	
58	Gates are closed but starting conditions not fulfilled	Gates are closed and contacts K1, K2 are active

## Safety Gates (switch 1 in position 3); Application Examples

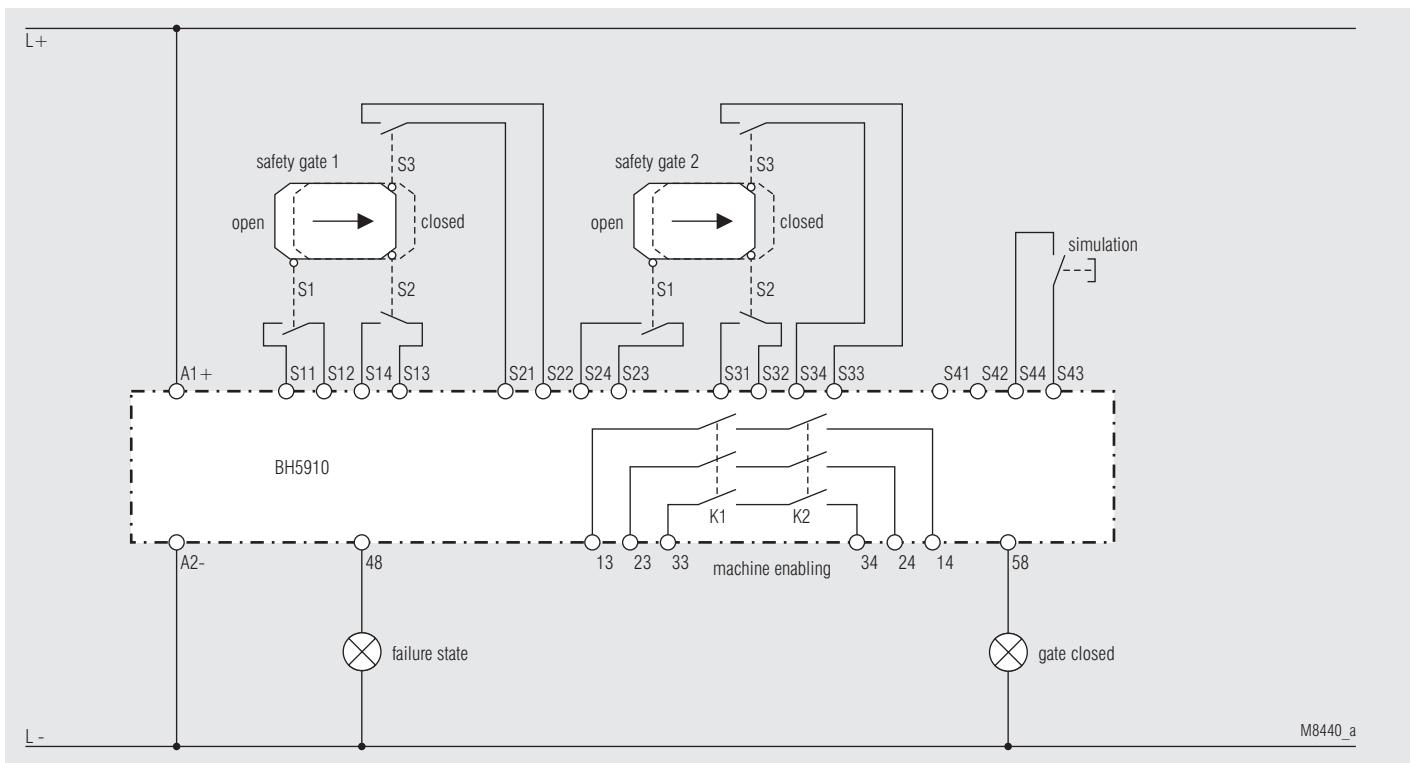

Pic. 8: Gate monitor, 4 gates with 2 NO gate contacts each (switch 1 in position 3; switch 10 in position 0)

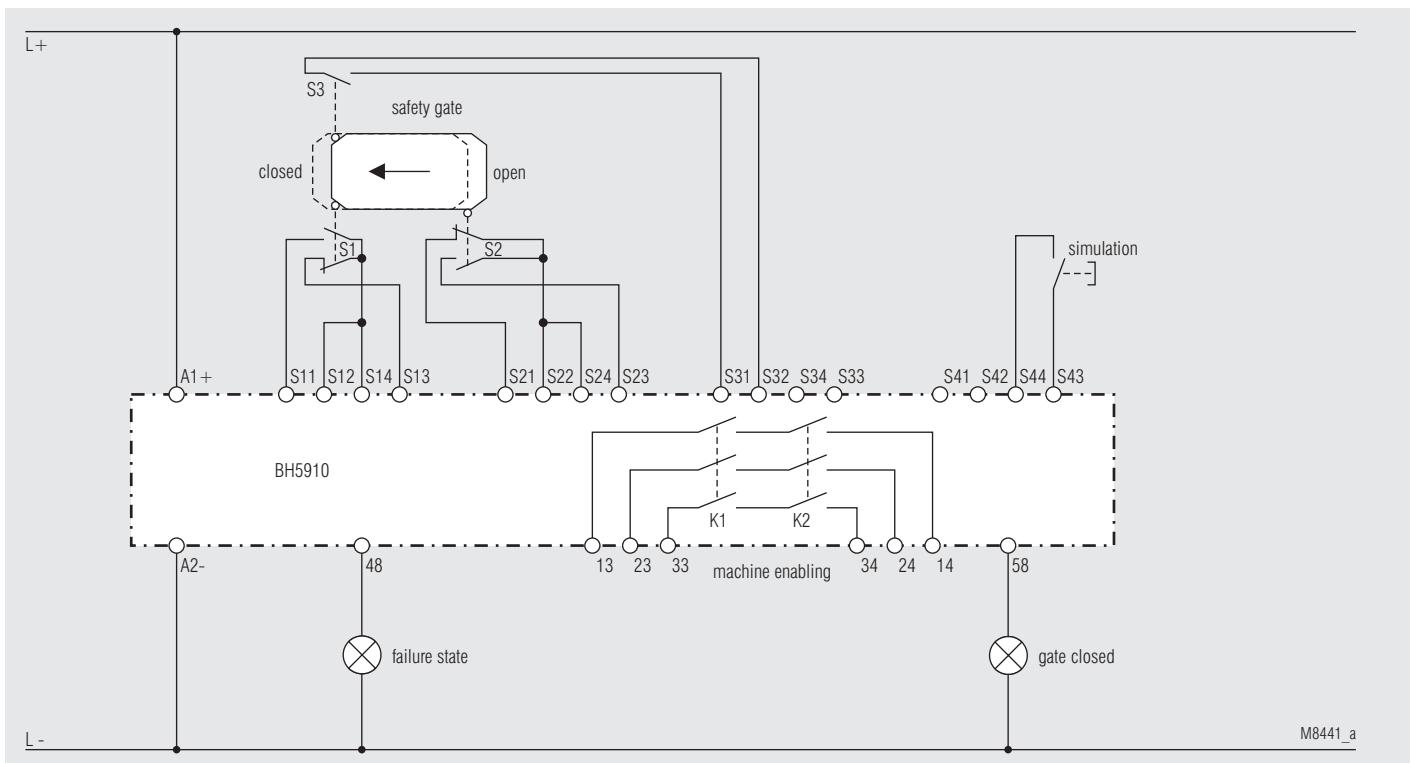

Pic. 9: Gate monitor, 2 gates with 2 changeover gate contacts each (switch 1 in position 3; switch 10 in position 2)

## Safety Gates (switch 1 in position 3); Application Examples

Pic. 10: Gate monitor, 2 gates with 3 NO gate contacts each, simulation button (switch 1 in position 3; switch 10 in position 4)

Pic. 11: Gate monitor, 1 gate with 2 changeover gate contacts, simulation button (switch 1 in position 3; switch 10 in position 5)

## Safety Gates and E-Stop (switch 1 in position 4)

With switch 10 the maximum number of gates is selected. Open (unused) inputs (S\_1/S\_2 and S\_3/S\_4) have to be linked with a wire bridge.

K1 and K2 can only be activated, if the e-stop loop is closed and all connected gates have been opened and closed again.

Both gate contacts have to be operated within 3 s. If the time difference is longer, the gate has to be opened before it can be closed again. When all gates are closed the unit can also be activated by an external connected simulation button.

After e-stop or power failure the unit can only be reset by manual start.

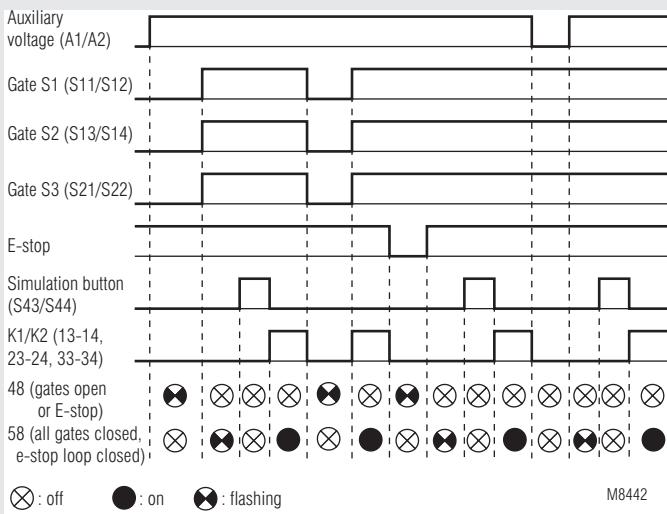

If changeover contacts are used on the gate switches the switchover time has to be less than 50 ms. If it is longer the outputs K1 and K2 are switched off and the unit gives failure code 7. This failure is stored and can only be reset by disconnecting the auxiliary supply.

## Settings on switch 10

Switch 10	No. of gates	Number and type of gate switches	Simulation button	Feedback circuit for external contactors
0	2	2 NO contacts	yes	no
1	1	2 C/O contacts	yes	no
2	1	3 NO contacts	yes	no
3	2	2 NO contacts	yes	yes
4	1	2 C/O contacts	yes	yes
5	1	3 NO contacts	yes	yes
6-9				position not allowed (failure 5)

NO contacts must be closed when gate is closed, NC contacts must be open when gate is closed.

## Function Diagram

Pic. 13: Gate monitor and E-stop, safety gate monitoring with up to 20 magnetic coded safety switches NE 5021 + 1 e-stop loop (switch 1 position 4; switch 10 position 0 or 3)

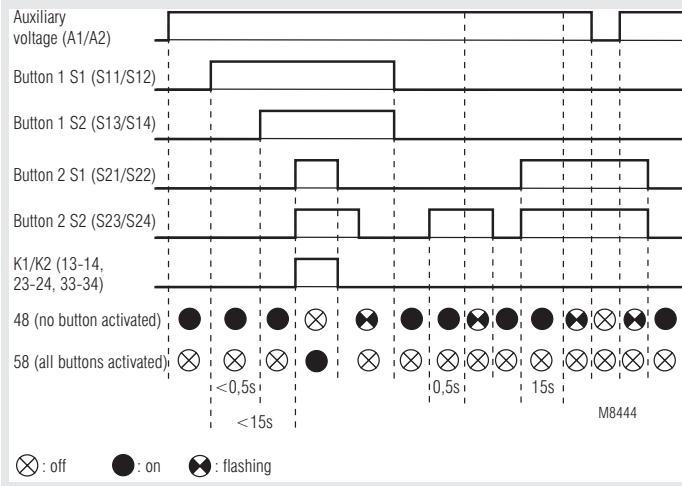

## Two-Hand Control (switch 1 in position 5)

4 pairs of 2-hand buttons Typ III A or 2 pairs of 2-hand buttons Typ III C according to DIN EN 574 can be connected in this function. The number of connected button pairs has to be selected on the device. K1 and K2 can only be activated, if 3 conditions are fulfilled:

- First all button pairs have to be in initial position.
- Both buttons of 1 pair have to be pressed within 0.5 sec.
- All connected pairs have to be operated within 15 s.

If changeover contacts are used in the 2-hand buttons the switchover time has to be less than 50 ms. If it is longer the outputs K1 and K2 are switched off and the unit gives failure code 7. This failure is stored and can only be reset by disconnecting the auxiliary supply.

### Function Diagram

Two-hand control, 2 pairs of buttons with 2 NO contacts each

### Set-Up Instructions

The device has to be connected as shown in the application examples. When connecting the push-buttons in parallel or in series the safe function of the relay is disabled. The buttons must be designed and installed in a way, that it is not possible to manipulate or to operate them without intention.

The distance between push buttons and dangerous area must be chosen in a way that it is not possible to reach the dangerous area after release of one button before the dangerous movement comes to standstill.

The safety distance "S" is calculated with the following formula:  
 $S = V \times T + C$

- moving speed of person  $V = 1\,600\text{ mm/s}$
- stopping time of the machine  $T$  (s)
- Additional safety distance  $C = 250\text{ mm}$

If the risk of accessing the dangerous area is prohibited while the push buttons are pressed e.g. by covering the buttons,  $C$  can be 0. The minimum distance has to be in this case 100 mm. See also EN 574.

### Settings on switch 10

Switch 10	Number of button pairs	Type of button contacts	Feedback circuit for external contactors
0	1	2 NO contacts	no

Pic.15: 2-hand control, with 2 pairs of buttons and 2 changeover contacts each (switch 1 in position 5; switch 10 in position 5)  
Safety switches Typ III C according to DIN EN 574

M8446\_a

## Two-Hand Control and E-Stop (switch 1 in position 6)

2 pairs of 2-hand buttons can be connected in this function together with 1 e-stop loop. The number of connected button pairs has to be selected on the device.

K1 and K2 can only be activated, if 4 conditions are fulfilled:

- First all button pairs have to be in initial position.
- The e-stop contacts must be closed and manual start must be activated.
- Both buttons of 1 pair have to be pressed within 0.5 sec.
- All connected pairs have to be operated within 15 sec.

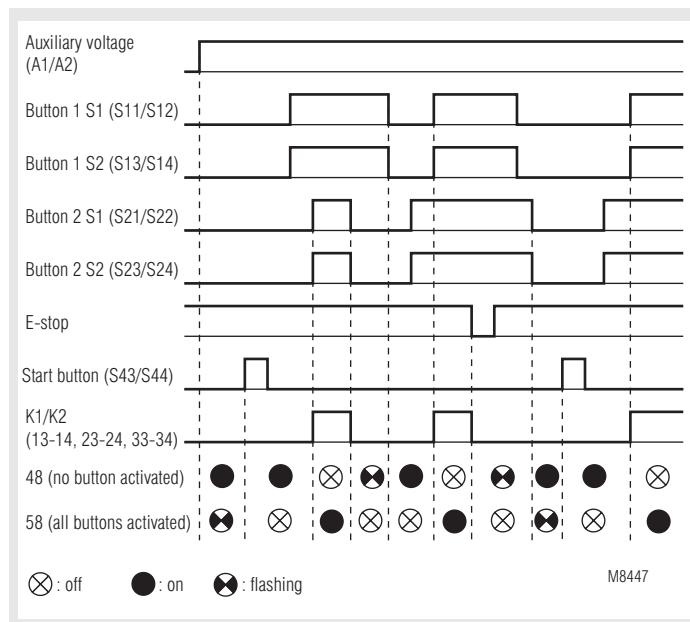

If changeover contacts are used in the 2-hand buttons the switchover time has to be less than 50 ms. If it is longer the outputs K1 and K2 are switched off and the unit gives failure code 7. This failure is stored and can only be reset by disconnecting the auxiliary supply.

After e-stop or power failure the start button must always be activated. The e-stop loop must be closed and all 2-hand button pairs must be in initial position.

### Settings on switch 10

Switch 10	Number of button pairs	Type of button contacts	Feedback circuit for external contactors
0	1	2 NO contacts	no
1	2	2 NO contacts	no
2	1	2 C/O contacts	no
3	1	2 NO contacts	yes
4	2	2 NO contacts	yes
5	1	2 C/O contacts	yes
6-9	position not allowed (failure 5)		

### Function Diagram

2-hand control and e-stop,  
with 2 pairs of buttons with 2 NO contacts each and 1 e-stop loop

### Set-Up Instructions

The device has to be connected as shown in the application examples. When connecting the push-buttons in parallel or in series the safe function of the relay is disabled. The buttons must be designed and installed in a way, that it is not possible to manipulate or to operate them without intention.

The distance between push buttons and dangerous area must be chosen in a way that it is not possible to reach the dangerous area after release of one button before the dangerous movement comes to standstill.

The safety distance "S" is calculated with the following formula:

$$S = V \times T + C$$

- moving speed of person V = 1 600 mm/s
- stopping time of the machine T (s)
- Additional safety distance C = 250 mm

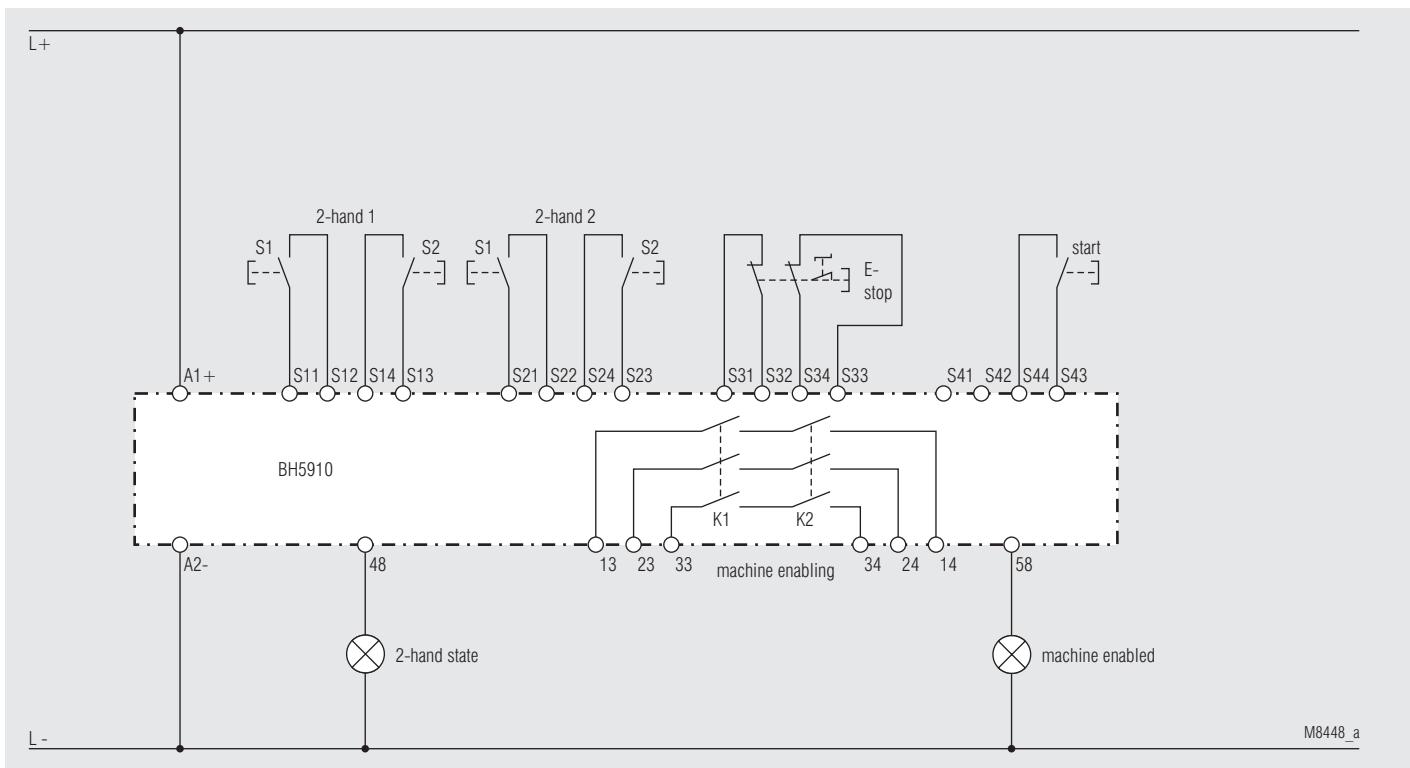

If the risk of accessing the dangerous area is prohibited while the push buttons are pressed e.g. by covering the buttons, C can be 0. The minimum distance has to be in this case 100 mm. See also EN 574.

### Terminal designation

d <sub>op</sub> :	220	d/a (days/year)
h <sub>op</sub> :	12	h/d (hours/day)
t <sub>Zyklus</sub> :	144	s/Zyklus

#### Values according to IEC/EN 62061 / IEC/EN 61508:

SIL CL:	3	IEC/EN 62061
SIL	3	IEC/EN 61508
HFT <sup>*</sup> :	1	
DC <sub>avg</sub> :	98.9	%
SFF	99.6	%
PFH <sub>D</sub> :	7.80E-9	h <sup>-1</sup>

<sup>\*</sup>) HFT = Hardware-Failure Tolerance

The values stated above are valid for the standard type.

Safety data for other variants are available on request.

The safety relevant data of the complete system has to be determined by the manufacturer of the system.

### UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL 508, "general use applications"

**Nominal voltage U<sub>N</sub>:** DC 24 V

**Ambient temperature:** 0 ... +50°C

#### Switching capacity:

Ambient temperature 50°C: Pilot duty B300  
5A 250Vac G.P.

5A 24Vdc  
Semiconductor outputs: 24Vdc, 100 mA

**Wire connection:** 60°C / 75°C copper conductors only  
AWG 20 - 12 Sol Torque 0.8 Nm  
AWG 20 - 14 Str Torque 0.8 Nm

Technical data that is not stated in the UL-Data, can be found in the technical data section.

### CCC-Data

**Thermal current I<sub>th</sub>:** 4 A

#### Switching capacity

to AC 15: 3 A / AC 230 V IEC/EN 60 947-5-1  
to DC 13: 1 A / DC 24 V IEC/EN 60 947-5-1

Technical data that is not stated in the CCC-Data, can be found in the technical data section.

## Standard Type

BH 5910.03/00MF2 DC 24 V  
 Article number: 0054217  
 • Output: 3 NO contacts  
 • All functions selectable via rotational switches  
 • Nominal voltage  $U_N$ : DC 24 V  
 • Width: 45 mm

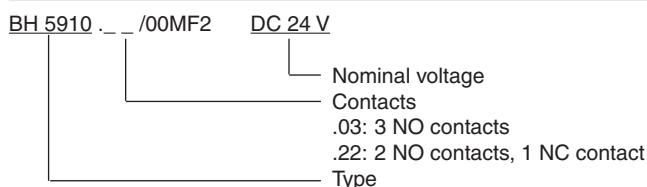

## Fault Indication by flashing code

The failure codes are displayed by a flashing sequence of the upper yellow LEDs run 1, run 2. Flashing frequency: env. 0,5 s on, 0,05 s off, end of the sequence: env. 2 s off. It is possible that the two processors show different failure codes.

If a failure is displayed, the relays K1 and K2 are switched off.

These failures are serious and do not allow further operation of the module. They are indicated only by the LEDs run 1 and / or run 2 of the module. The semiconductor outputs 48 and 58 are both switched off. The module can only be reset by switching the power supply off and on again.

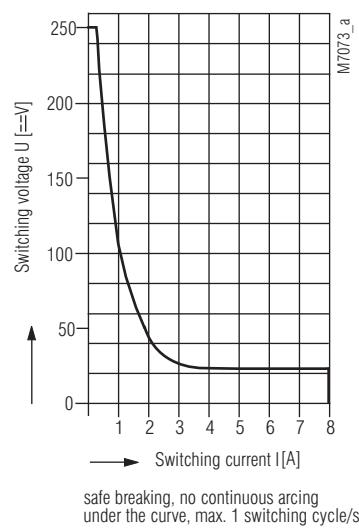

## Ordering Example

## Variant

BH 5910/61: with UL-approval

## Characteristic

Limit curve for arc-free operation

N°*)	Description	Mesures et conseils
0	Internal module failure (LEDs are continuously off)	If both LEDs stay off, the module is defective and has to be repaired.
5	Adjustment failure	1) The settings of the 2 channels are not identically. 2) The selected setting is not permitted.
6	Undervoltage detection ou Overvoltage detection	1) Left LED is flashing: The supply voltage dropped below the permitted value (< approx.0.85 $U_N$ ) 2) Right LED is flashing: The supply voltage went over the permitted value (> approx.1.15 $U_N$ + 5 % residual ripple)
7	Input failure	1) A short circuit has been detected on the inputs of the unit. 2) The 2 signals of a 2-channel sensor (E-stop button, light curtain) are not identical. (Short circuit, broken wire, other defects).
8	Failure on relays K1 or K2	Check circuit and current. Module has to be repaired.
9	Internal module failure	Please try to evaluate the circumstances that lead to this fault and check with the supplier or manufacturer.
10		
11		
12	Internal module failure	
13		
14		The module has to be repaired

\*) No.: Number of flash pulses in a series

## SAFEMASTER M Multifunction Safety System System Overview

0261526

### Approvals and Markings

### Applications

flexible, multi purpose and expandable

The SAFEMASTER M multifunction system offers an ideal solution to control the safety functions for many areas in machine building and plant processing.

For example: Paper and printing industry, Forming machinery, Food, Beverage and Packaging industry, Robot cells, Machine tools and complete production transfer lines.

In many cases this system offers a complete solution to the ever-increasing demand in automation to process more and more safety functions, the SAFEMASTER M offering a highly flexible but cost effective solution compared with conventional safety modules.

This system is suitable to link and control safety functions to safety category up to Cat. 4, PLe (EN ISO 13849-1) resp. SIL 3 (IEC/EN 61508, IEC/EN 62061).

Ideal solutions for mobile and stationary machines and plants with dangerous areas

- during automatic operation e. g. to clear failures
- during set up e. g. to adjust machine parameters, maintenance, set up

- Multifunction, modular safety system with field bus interface

### Your Advantages

- Free interconnection of input and output functions
- Group hierarchy easily achieved
- No programming required
- Simple set up via internal switches
- Function selection set by screwdriver
- Control of a large system is possible without complicated wiring
- Flexible on site adjustment available to change functions
- System is easily extended via extender modules
- System indication on all modules via LED and semiconductor monitoring outputs
- Field bus interface option available to signal the system status
- Multifunction allows ease of design and build

### Features

- Up to 26 single-channel or 13 2-channel input circuits
- Up to 15 redundant, safety output contacts according to cat. 4 PLe (EN ISO 13849-1) e. g. SIL 3 (IEC/EN 61508, IEC/EN 62061)
- 4 start button-inputs for enabling/acknowledgement
- 2 Semiconductor monitoring output in each input module and control unit
- 1 input for a feed back circuit in output module each
- Manual/Auto-Start
- with/without cross fault detection
- As option with instantaneous or delayed relay outputs
- System indication via optional field bus interface
- 4 output groups operated either separately, together or individually combined.

### Additional Information About This Topic

- You will find information about the single modules of SAFEMASTER M in each datasheets (see „system components“)
- You will find detailed information in the System description SAFEMASTER M

## More Functions, More Flexibility and High Safety Level

The software free safety system SAFEMASTER M allows individual safety solutions. Monitoring of different safety functions like e-stop, safety gates, light barriers, light curtains, safety mats, 2-hand controls according to EN 574 IIIA/IIC etc. can be made. Instantaneous stop or controlled disconnection with delayed contacts is possible.

## Free Assignment of Input Modules to Output Modules

The SAFEMASTER M includes the most important functions of a small safety plc. It controls as master unit the safety functions of machines and production lines. The input modules can be assigned individually to output modules. A gateway as option allows to connect the system to existing, non-safety bus systems for indication purposes.

## No Software Necessary

Software is not required. The configuration is made using simple DIP-switches. This means no cost for programming, configuration and service tools, no problems and no cost for updates when new operating systems are introduced. Cost for software training is also saved.

## Partner for a Standard PLC

The SAFEMASTER M is an ideal supplement to a standard plc. While the plc is responsible for the machine control, SAFEMASTER M handles all safety related switching functions. Safety relevant states can be transferred by standard semiconductor outputs or via field bus connection to the plc for indication.

## The System

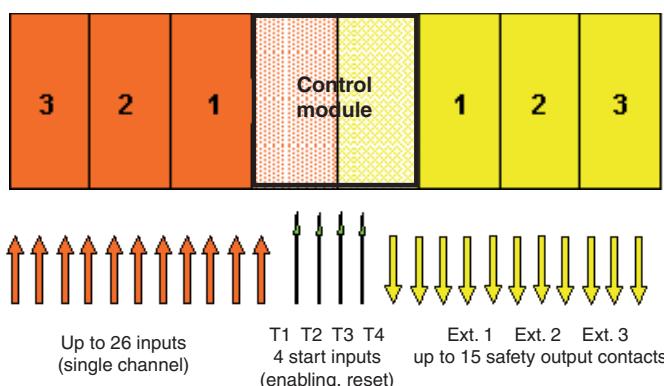

Diagnostic Module  
- CANopen  
- Profibus-DP

Input Module

Control Unit

Output Module

Ext. 1-3 = Extension modules 1-3

## The Control Module

The heart of SAFEMASTER M is the control module BH 5911. It is the controller of the whole system but includes already input and outputs. A dual channel input for Cat4 e-stop is integrated. When using single channel Cat2 e-stops, 2 e-stop loops are available. 4 start inputs are also integrated in the control module. The assignment of the start buttons to the input modules is made via DIP-switches in each individual input module. Up to 3 input modules can be placed on the left side and up to 3 output modules to the right side of the control module on a DIN rail. The electrical connection is made by a flat type cable.

## The Input Module

The safety functions are programmed in the firmware of the input modules. A speciality of the input modules is that up to 4 safety functions of cat. 4, PLe (EN ISO 13849-1) resp. SIL 3 (IEC/EN 61508, IEC/EN 62061) are integrated i. e. 8 safety input channels.

Modules can have 4 identical safety functions, or mixed functions. DOLD has made a pre-selection of the most common required combinations in practice. To reduce the number of possible combinations to a minimum each module contains up to 4 different combinations of the 4 possible safety functions that can be chosen on site by the user. This multifunction feature reduces stock cost.

The selection of the right input module is very important to get the optimum solution. For demonstration see below example with the modules BG5913.08/01MFO.

Each input module has 2 semiconductor outputs for indication e. g. to a PLC.

**BG5913.08/01MFO**

**Dual channel safety functions**

Rotary switch in input module	1 x	3 x	-
-	2 x	2 x	-
-	1 x	1 x	1 x
1 x	-	1 x	1 x
-	3 x	1 x	-

## The Output Modules

Each output module has safety related (redundant) outputs according to Cat 4, PLe (EN ISO 13849-1) resp. SIL 3 (IEC/EN 61508, IEC/EN 62061). All contacts in one module switch together. Different contact combinations are available e. g.

- 4 NO contacts
- 3 NO contacts, 1 NC contact
- instantaneous switching
- delayed switching
- combination of instantaneous and delayed

Each output module integrates a feed back input to monitor external contactors.

## SAFEMASTER M Multi-Function Safety System

Diagnostic Module for CANopen

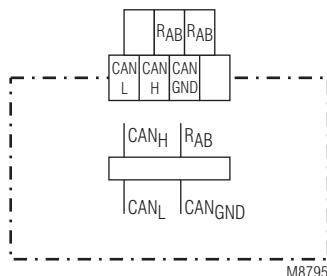

BG 5551

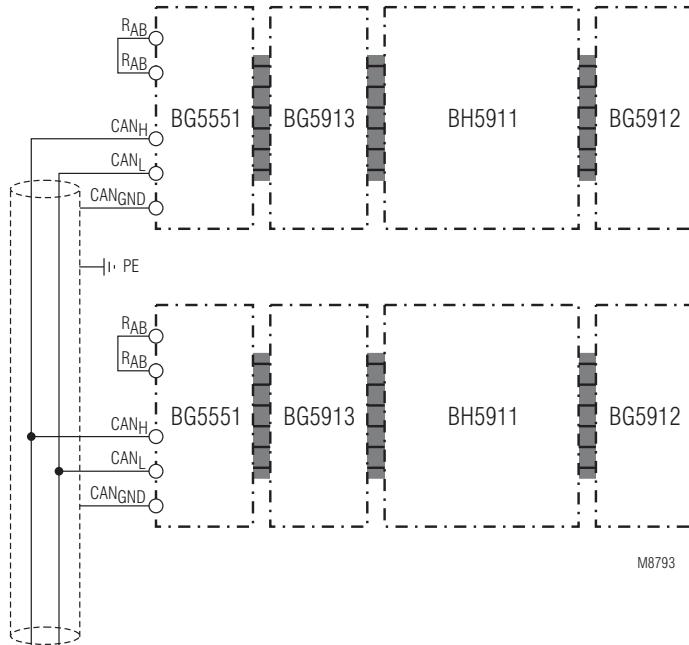

0272625

### Circuit Diagram

### Connection Example

- For transmitting the status information from the control unit and the input modules, e.g. input and error states, start button and safety output assignments, to a control system or bus-capable display
- Galvanic separation
- Adjustment of transmission via rotary switch
- LED indicators for operating voltage and status
- Width 22,5 mm

### Approvals and Markings

### Applications

For connection to a CANopen network for visualizing the status of the multi-function safety system SAFEMASTER M.

### Indicators

Green LED „on“: on when supply connected

Green LED „run“: Continuously on, when the diagnostic module is accessed by the bus, flashing, when a bus failure is detected

### Device Connection

The diagnostic module is simply connected via flatcable instead of the left termination plug of the safety system. This connection is used for the power supply and for receiving the data to be evaluated.

The CANopen-Bus is connected via terminals CAN<sub>L</sub> und CAN<sub>H</sub>. When the diagnostic module is physically installed at the end of the CAN Bus, the terminals R<sub>AB</sub> have to be bridged.

### Device Setting

The address (01 to 99) of the module in the CANopen system is set on the rotary switches 10<sup>1</sup> and 10<sup>0</sup>.

The middle switch allows to set the data transmission rate. 20 Kbit, 125 Kbit, 500 Kbit or 1000 Kbit.

All other configurations is done by software, e.g. Pro CANopen. A configuration file is necessary which can be obtained on CD-Rom PN 5501. It is located in the folder CANopen/EDS.

Order reference: PN 5501, Article number: 0052860

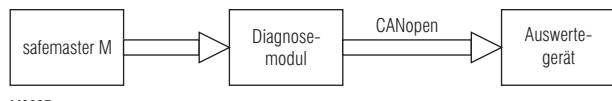

### Attention:

Work on the device must be carried out by specialist personnel when the device is in a deenergized state.

### Information on System Diagnostics

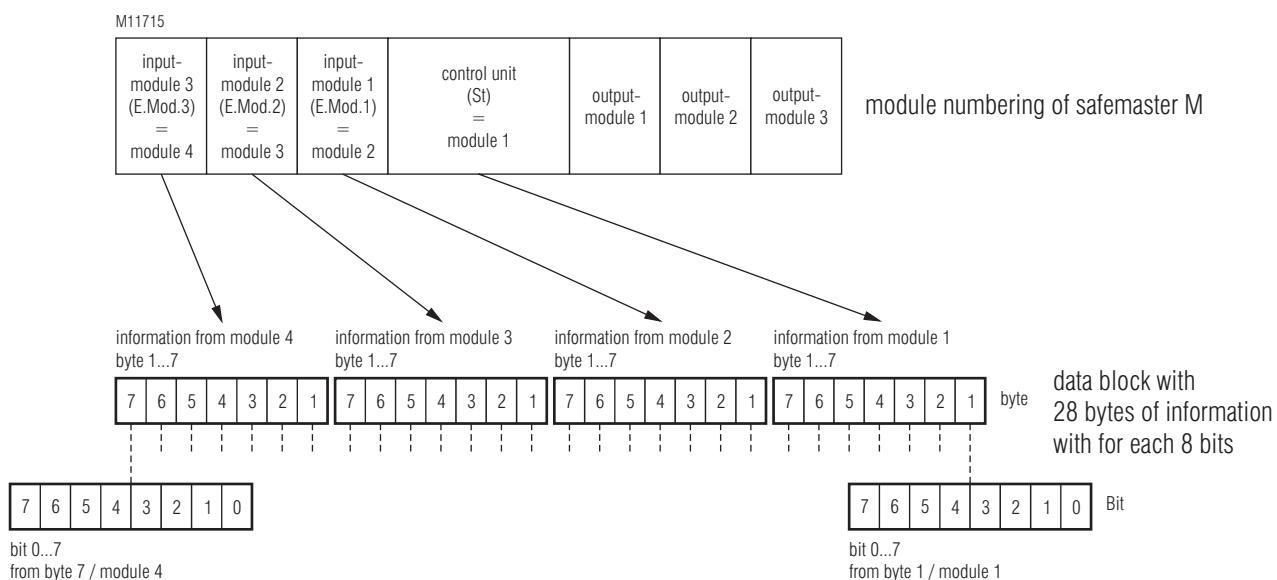

M8807

Flow of information to evaluate data

### Information Structure

The diagnostic module delivers depending on the configuration a package of max. 28 information bytes. These are 7 Bytes for the control unit, and 7 Bytes each for the 3 possible input modules. Each byte has 8 information bits (Bit 0 ... Bit 7). The tables below „Structure of Diagnostic Information“ show the assignment of each byte.

## Structure of Diagnostic Information

Byte No.	CANopen designation	Module	Informationsbytes				Bit 1	Bit 0
			Bit 7	Bit 6	Bit 5	Bit 4		
1	<b>Modul1 ModulNr</b> <b>Modul2 ModulNr</b> <b>Modul3 ModulNr</b> <b>Modul4 ModulNr</b>	St* E.Mod.1* E.Mod.2* E.Mod.3*	0	0	0	0 = OK 1 = Systemfehler	Module number, if module available	0001 = Modul 1 0010 = Modul 2 0011 = Modul 3 0100 = Modul 4
2	Modul1 assignments Modul2 assignments Modul3 assignments Modul4 assignments	St* E.Mod.1* E.Mod.2* E.Mod.3*	1 = T4	1 = T3	1 = T2	1 = T1	Which output module does this module have an effect on? If bit 4 is set in the module number: system error code	0000 0000: Module not available or another module reports errors. In this case, all 7 bytes have the value 0000 0000. 0000 0000: Which start button effects this module?
3	Modul1 input status Modul2 input status Modul3 input status Modul4 input status	St* E.Mod.1* E.Mod.2* E.Mod.3*	1 = T4 activated	1 = T3 activated	1 = T2 activated	1 = T1 activated	T4 = start button: 0 if T4 = stop-button: 1 = Stop activated	1 = input S14 inactive 1 = input S12 inactive
4	Modul1 output status Modul2 output status Modul3 output status Modul4 output status	St* E.Mod.1* E.Mod.2* E.Mod.3*	1 = output module 3 activated	1 = output module 2 activated	1 = output module 1 activated	1 = safety outputs of control unit activated	1 = input S34 inactive 1 = input S32 inactive	1 = input S24 inactive 1 = input S14 inactive
5	Modul1 status byte 1 Modul2 input status Modul3 input status Modul4 input status	St* E.Mod.1* E.Mod.2* E.Mod.3*	1 = error on a safety output 1 = control unit reports errors (bit 4 or 7 of module status byte 1 set)	0	0	1 = release of assigned safety outputs enabled	0 Position of function switch (0000 bis 1001 for function 0 to 9) see comments below	1 = short circuit on the inputs Position of function switch (0000 bis 1001 for function 0 to 9) Status of output 48 (error code)
6	Modul1 status byte 2 Modul2 status byte 2 Modul3 status byte 2 Modul4 status byte 2	St* E.Mod.1* E.Mod.2* E.Mod.3*	The assignment of this byte depends on the function of the control unit or the respective input module (see the following pages)	1 = waiting for activation of assigned start button (error has been eliminated)	0	0		
7	Modul1 starts and security outputs Modul2 starts and security outputs Modul3 starts and security outputs Modul4 starts and security outputs	St* E.Mod.1* E.Mod.2* E.Mod.3*	start button T4 activated	start button T3 activated	start button T2 activated	start button T1 activated	1 = activation of output module 3 enabled 1 = activation of output module 2 enabled 1 = activation of output module 1 enabled	1 = activation of safety outputs of Cr* enabled 1 = activation of safety outputs of Cr* enabled

**Comment:** Bit 7 and bit 4 of the **Modul x status byte 1** (Byte 5) are saved from the time when the fault was corrected until the module is restarted. DThe fact that the fault was corrected is indicated by bit 5 in the case of a manual start; and by bit 6 in the case of an automatic start. If these errors are detected in the control unit, the entire **SAFEMASTER M** system is locked. If the input modules are error-free in the „automatic start“ mode, their bits 7 and 6 flash in the case of an automatic start. If these errors are detected in the control unit or in the safety outputs.

## Structure of Diagnostic Information

Assignment of bytes 6 in the different modules of SAFEMASTER M

### Control unit BH 5911:

	<b>Bit 7</b>	<b>Bit 6</b>	<b>Bit 5</b>	<b>Bit 4</b>	<b>Bit 3</b>	<b>Bit 2</b>	<b>Bit 1</b>	<b>Bit 0</b>
Modul1 status byte 2	1 = start button activated for too long (>3s)	1 = one of the assigned start buttons has been activated	1 = emergency stop S14 activated	1 = emergency stop S12 activated	1 = error on output module 3	1 = error on output module 2	1 = error on output module 1	1 = error on the safety outputs of the Ct* module

**Comment 1:** All signals are saved from the time when the error is detected until the safety outputs are released for activation again. The fact that the error was corrected is indicated in **status byte 1** (byte 5), bits 5 and 6.

**Comment 2:** In the case of a 2-channel emergency stop, bits 5 and 4 change together. For more precise diagnostics of the input signals, byte 3 (status of the inputs) must be evaluated.

### Input module BG 5913.08/\_0\_ \_ \_ \_

	<b>Bit 7</b>	<b>Bit 6</b>	<b>Bit 5</b>	<b>Bit 4</b>	<b>Bit 3</b>	<b>Bit 2</b>	<b>Bit 1</b>	<b>Bit 0</b>
Modul2 status byte 2			1 = one of the assigned simulation buttons has been activated		1 = function group 4 of module does not grant release <sup>(1)</sup>	1 = function group 3 of module does not grant release <sup>(1)</sup>	1 = function group 2 of module does not grant release <sup>(1)</sup>	1 = function group 1 of module does not grant release <sup>(1)</sup>
Modul3 status byte 2		1 = time error <sup>(2)</sup>			0 (unused)			
Modul4 status byte 2								

**BComments:** Except for bit 6 and 5, all signals are saved from the time when the error is detected until the assigned safety outputs are released for activation again. The fact that the error was corrected is indicated in **status byte 1** (no. 19, 20 or 26), bits 5 and 6.

- 1) The numbers of the different function groups match the numbering of the safety functions in the application examples of the data sheet of input module BG 5913.08/\_0\_ \_ \_ \_ . If less than 4 functions are possible as a result of the input module setting (e.g. max. 2 with two-hand control type IIC), the surplus bits are set to 0.
- 2) Time error is detected if the start or simulation buttons (>3s) are activated for too long. A time error message is also generated if two sensors of a function are not activated in the required time window (e.g. in the case of gates or two-hand controls).

### Input module BG 5913.08/\_1\_ \_ \_ \_ , BG 5913.08/\_2\_ \_ \_ \_ and BG 5913.08/\_3\_ \_ \_ \_

	<b>Bit 7</b>	<b>Bit 6</b>	<b>Bit 5</b>	<b>Bit 4</b>	<b>Bit 3</b>	<b>Bit 2</b>	<b>Bit 1</b>	<b>Bit 0</b>
Modul2 status byte 2			1 = one of the assigned start buttons or simulation buttons has been activated		0 (unused)	0 (unused)	1 = function group 4 of module does not grant release <sup>(1)</sup>	1 = function group 3 of module does not grant release <sup>(1)</sup>
Modul3 status byte 2		1 = time error <sup>(2)</sup>						
Modul4 status byte 2								

**Comments:** Except for bit 6, all signals are saved from the time when the error is detected until the assigned safety outputs are released for activation again. The fact that the error was corrected is indicated in **status byte 1** (no. 19, 20 or 26), bits 5 and 6.

- 1) The numbers of the different function groups match the numbering of the safety functions in the applications examples of the data sheet from input module. If a function combination with two-hand type IIC is set on the input module, only 3 function groups are available and bit 3 is then always 0.
- 2) Time error is detected if the start or simulation buttons (>3s) are activated for too long. A time error message is also generated if two sensors of a function are not activated in the required time window (e.g. in the case of gates or two-hand controls).

## Structure of Diagnostic Information

Input module BG 5914.08/\_0 → BH 5914.08/\_1 and BH 5914.08/\_2 → --

	<b>Bit 7</b>	<b>Bit 6</b>	<b>Bit 5</b>	<b>Bit 4</b>	<b>Bit 3</b>	<b>Bit 2</b>	<b>Bit 1</b>	<b>Bit 0</b>
Modul2 status byte 2	1 = start button activated for too long (>3s)	1 = one of the assigned start buttons has been activated	1 = emergency stop on S14, S24, S34 or S44 does not grant release <sup>1)</sup>	Double contact error on S42 - S44 <sup>2)</sup>	1 = emergency stop on S42 or S44 does not grant release <sup>1)</sup>	1 = emergency stop on S32 or S34 does not grant release <sup>1)</sup>	1 = emergency stop on S22 or S24 does not grant release <sup>1)</sup>	1 = emergency stop on S12 or S14 does not grant release <sup>1)</sup>
Modul3 status byte 2								
Modul4 status byte 2								

**Comments:** Except for bit 6, all signals are saved from the time when the error is detected until the assigned safety outputs are released for activation again. The fact that the error was corrected is indicated in **status byte 1** (no. 12, 19 or 26), bits 5 and 6.

1) The emergency stop function which actually prevented the release can only be recognized from the combination of bit 5 with the bits 0 to 3. The current status of the inputs is always visible in byte 10, 17 or 24 (status of the inputs).

- 2) Bit 4 is only set if S42 and S44 are set for 2-channels for the emergency stop function, and both signals do not match.

## Interpretation Example for Diagnostic Information

We have a safemaster M system with the following components:

- 1 control unit BH 5911.03/00MFO
- 1 output module BG 5912.04
- 1 diagnostic module BH 5552 for Profibus DP

The transmitted information from diagnostic module BH 5552 is to be used in order to observe how and why the outputs of output module 1 change.

The available diagnostic information of the control unit and its changes are shown here:

### 1. Normal state: Safety outputs are activated, all EMERGENCY STOP buttons are released

	Bit no. 76543210	
Byte 1: Module number:	Hex: 01	Bin: 00000001
Byte 2: Assignments:	Hex: 13	Bin: 00010011
Byte 3: Status of inputs:	Hex: 00	Bin: 00000000
Byte 4: Status of outputs:	Hex: 00	Bin: 00000000
Byte 5: Status byte 1:	Hex: 45	Bin: 01000101
Byte 6: Status byte 2:	Hex: 00	Bin: 00000000
Byte 7: Start button and safety outputs:	Hex: 0B	Bin: 00000011

Module number 01 with deleted bit 4 shows that the entire safemaster M system is working properly.

The set bits 0 to 3 of status byte 1 show that the function switch of the control unit (module1) is set to position "5". That means that the following mode of operation is set:

2 x 1 channel emergency stop, manual start, 4 start buttons

The set assignments in byte 2 shows you that the control unit is started by the start button 1 (bit 4), and it has an effect on its own outputs (bit 0) and the outputs of output module 1 (bit 1). Since no input module is available, the outputs of both modules must always have the same status.

The set bit 6 in status byte 1 means the control unit grants the release for setting the safety outputs which are assigned to it. The fact that the outputs are actually set can be seen in byte 4.

### 2. Emergency stop button on S12 activated

	Bit no. 76543210	
Byte 1: Module number:	Hex: 01	Bin: 00000001
Byte 2: Assignments:	Hex: 13	Bin: 00010011
Byte 3: Status of inputs:	Hex: 01	Bin: 00000001
Byte 4: Status of outputs:	Hex: 0x	Bin: 000000xx = flash
Byte 5: Status byte 1:	Hex: 05	Bin: 00000101
Byte 6: Status byte 2:	Hex: 10	Bin: 00010000
Byte 7: Start button and safety outputs:	Hex: 00	Bin: 00000000

Bit 6 in status byte 1 shows that the control unit does not release the safety outputs which are assigned to it.

The reason for this is indicated by bit 0 in byte 3 (input S12 inactive) and by bit 4 in status byte 2 (emergency stop activated). The set bit 4 in byte 6 is saved until the release is granted again.

Byte 4 signals that the outputs have actually dropped out (bit 4 and 5) and the output 48 (bit 2) as well as the LED run 1 (bit 0) flash.

### 3. Emergency stop button is unlocked again

	Bit no. 76543210	
Byte 1: Module number:	Hex: 01	Bin: 00000001
Byte 2: Assignments:	Hex: 13	Bin: 00010011
Byte 3: Status of inputs:	Hex: 00	Bin: 00000000
Byte 4: Status of outputs:	Hex: 0x	Bin: 000000xx
Byte 5: Status byte 1:	Hex: 25	Bin: 00100101
Byte 6: Status byte 2:	Hex: 10	Bin: 00010000
Byte 7: Start button and safety outputs:	Hex: 00	Bin: 00000000

Since all inputs are in quiescent state again, only the status bytes 1 and 2 as well as byte 4 (status of outputs) still indicate that safemaster M was switched off. However, the saved bit 4 in status byte 2 still shows the reason for switch-off.

### 4. Start button T1 is activated

	Bit no. 76543210	
Byte 1: Module number:	Hex: 01	Bin: 00000001
Byte 2: Assignments:	Hex: 13	Bin: 00010011
Byte 3: Status of inputs:	Hex: 01	Bin: 00010000
Byte 4: Status of outputs:	Hex: 00	Bin: 00000000
Byte 5: Status byte 1:	Hex: 05	Bin: 00100101
Byte 6: Status byte 2:	Hex: 00	Bin: 00000000
Byte 7: Start button and safety outputs:	Hex: 00	Bin: 00000000

If the start button was activated properly (< 3 s), the system returns to the normal state described under section 1. If the start button is activated for too long (> 3 s), bit 7 would signal in byte 6.

#### Comment:

If a system was already put into operation, it is often sufficient just to evaluate status bytes 1 and 2.

Depending on the depth and degree of detail of the diagnostics, e.g. in the case of troubleshooting when placing the system into operation, the other bytes can also be included if required.

# Safety technique

## SAFEMASTER M Multi-Function Safety System

Diagnostic Module for Profibus DP

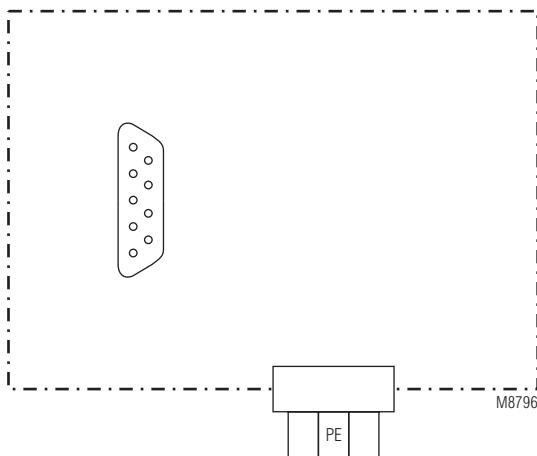

BH 5552

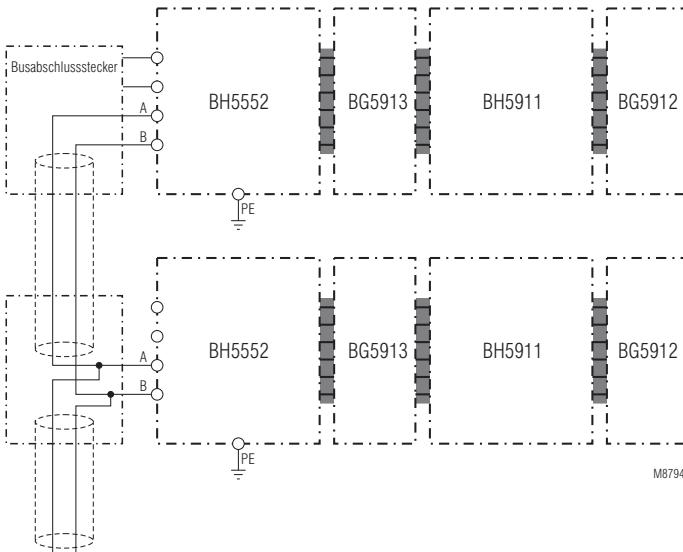

0285550

### Circuit Diagram

### Connection Example

- For transmitting the status information from the control unit and the input modules, e.g. input and error states, start button and safety output assignments, to a control system or bus-capable display
- Electrical isolation
- Automatic recognition of transmission speed
- LED indicators for operating voltage and status
- Width of 45 mm

### Approvals and Markings

### Applications

For connection to a Profibus DP network for visualizing the status of the multi-function safety system SAFEMASTER M.

### Indicators

Red LED "err":	lights in the event of an error
Yellow LED "run":	lights if data is transmitted correctly
Green LED "rdy":	to indicate operational readiness
Red and green LED:	flash if device address 0 is set (reserved for master).

### Device Connection

The diagnostic module is simply connected via flat cable instead of the left termination plug of the safety system. This connection is used for the power supply and for receiving the data to be evaluated.

The Profibus DP network is connected via the SubD connector on the device. The installation guidelines based on the PNO document "Installation Guideline for Profibus DP/FMS" must be followed.

### Device Setting

The address (01 to 99) of the module in the Profibus DP system is set on the rotary switches ADR 10 and ADR 1.

To configure the network, the device master file "EDS080F.gsd" is needed, which is located on the DOLD-CD PN 5501, in directory Profibus/GSD. Order designation: PN 5501, item number: 0052860

### Attention:

Work on the device must be carried out by specialist personnel when the device is in a deenergized state.

## Technical Data

### Input

<b>Nominal voltage <math>U_N</math>:</b>	DC 24 V (power is supplied - by the safemaster M)
<b>Voltage range:</b>	0.85 ... 1.15 $U_N$
<b>Nominal consumption:</b>	max. 100 mA
<b>Profibus DP interface</b>	Twisted, shielded two-wire line
Transmission medium:	IEC 61 158
<b>Protocol:</b>	Profibus DP-V0
Maximum length:	1200 m at 9.6 Kbit/s...45.45 Kbit/s 1000 m at 93.75 Kbit/s...137.5 Kbit/s 400 m at 500 Kbit/s 200 m at 1500 Kbit/s 100 m at 3000 Kbit/s...12000 Kbit/s

The installation guidelines based on the PNO document "Installation Guideline for Profibus DP/FMS" must be followed for the maximum linear expansion of a bus segment. The PE connector must be grounded.

### General Data

<b>Nominal mode of operation:</b>	Continuous operation
Temperature range:	$\pm 0 \dots + 50^\circ C$ At an operating temperature of $50^\circ C$ the modules must be mounted with a distance of 3 - 5 mm.
<b>EMC</b>	
HF irradiation:	10 V / m
Fast transients on supply line:	2 kV
on signal and control lines:	2 kV

## Technical Data

Surge voltage between supply lines:	1 kV	IEC 61 000-4-5
between supply line and ground:	2 kV	IEC 61 000-4-5
HF wire guided:	10 V	IEC 61 000-4-6
Interference suppression:	Limit value class B	EN 55 011
<b>Degree of protection</b>		
Housing:	IP 20	IEC/EN 60 529
Terminals:	IP 20	IEC/EN 60 529
Housing:	Thermoplastic with V0 behaviour according to UL subject 94	
<b>Vibration resistance:</b>	Amplitude 0.35 mm frequency 10 ... 55 Hz	IEC/EN 60068-2-6
<b>Resistance to shock</b>		
Acceleration:	10 g	
Impulse length:	16 ms	
Number of shocks:	1000 per axis on 3 axes	
<b>Climate resistance:</b>	0 / 050 / 04	IEC/EN 60 068-1
<b>Terminal designation:</b>	EN 50 005	
<b>Wire connection:</b>	1 x 2.5 mm <sup>2</sup> stranded wire with sleeve or 1 x 4 mm <sup>2</sup> solid or 2 x 1.5 mm <sup>2</sup> stranded wire with sleeve DIN 46 228-1/-2/-3/-4	
<b>Wire fixing:</b>	Terminal screws M3,5, box terminals with wire protection	
<b>Mounting:</b>	on DIN rail	IEC/EN 60 715
<b>Weight:</b>	240 g	

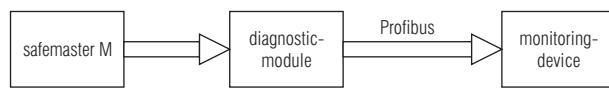

### Dimensions

## Information on System Diagnostics

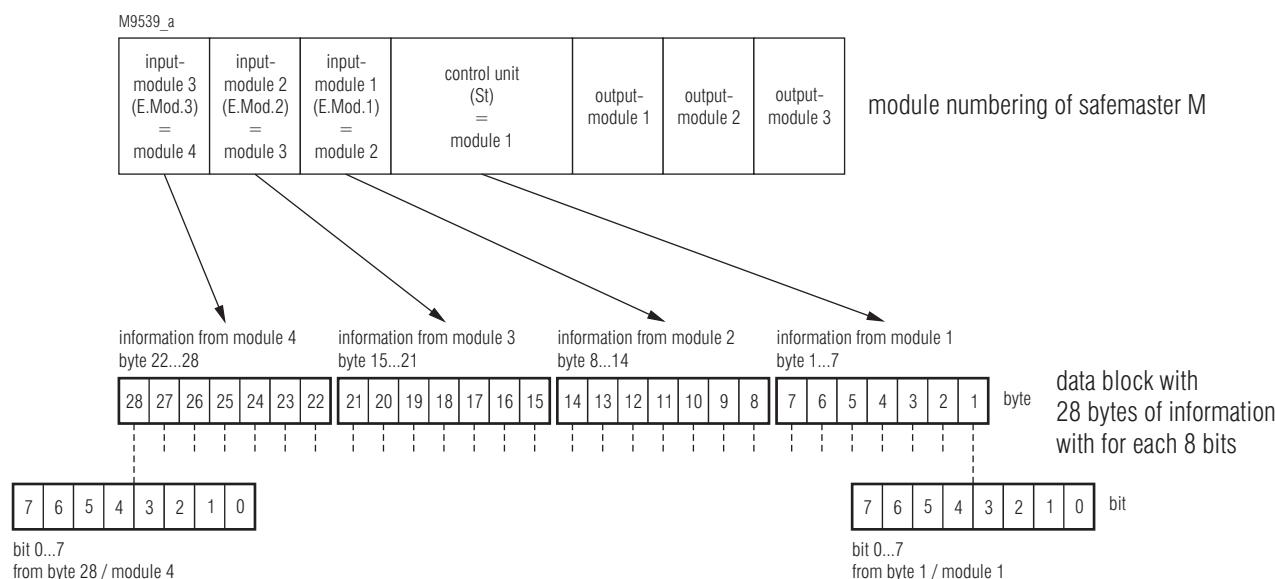

M9538

Information flow for data evaluation

## Information Structure

The diagnostic module delivers a packet of 28 information bytes. 7 bytes each for the control unit and the 3 connectable input modules. The assignment of the individual bytes is given in the descriptions of the different control or input modules.

## Structure of Diagnostic Information

\* Ct = Control Unit, I.Mod. = Input Module

Contents	Profibus DP byte no.	Mod.	Information bytes						
			Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1
Module number	1 8 15 22	Ct* I.Mod1* I.Mod2* I.Mod3*	0	0	0	0	0	0	0001 = module 1 0010 = module 2 0011 = module 3 0100 = module 4
Assignments	2 9 16 23	Ct* I.Mod1* I.Mod2* I.Mod3*	1 = T4	1 = T3	1 = T2	1 = T1	1 = output module 3	1 = output module 2	1 = input module 1 Control unit
Status of inputs	3 10 17 24	Ct*	1 = T4 activated	1 = T3 activated	1 = T2 activated	1 = T1 activated	T4 = start button: 0 if T4 = stop button: 1 = stop activated	0	1 = input S14 inactive  1 = input S34 inactive
Status of outputs	4 11 18 25	Ct*	1 = output module 3 activated	1 = output module 2 activated	1 = output module 1 activated	1 = safety outputs of control unit activated	1 = input S44 inactive	1 = input S34 inactive	1 = activation of assigned output modules released (green LEDs left)  Status of output 48 (error code)
Status byte 1	5 12 19 26	Ct*	1 = error on a safety output  1 = control unit reports errors (bit 4 or 7 of module status byte 1 set)  see comments below	0	0	1 = release of assigned start button 1 = short circuit on the inputs	0	0	Status of yellow LED run 1 (error code)  Position of function switch (0000 to 1001 for function 0 to 9)
Status byte 2	6 13 20 27	Ct* I.Mod1* I.Mod2* I.Mod3*	1 = start button T4 activated	1 = start button T3 activated	1 = start button T2 activated	1 = start button T1 activated	1 = activation of output module 3 enabled	1 = activation of output module 2 enabled	1 = activation of safety outputs of Ct* enabled
Start button and safety outputs	7 14 21 28	Ct* I.Mod1* I.Mod2* I.Mod3*	1 = start button T4 activated	1 = start button T3 activated	1 = start button T2 activated	1 = start button T1 activated	1 = activation of output module 3 enabled	1 = activation of output module 1 enabled	1 = activation of safety outputs of automatic start

**Comment:** Bit 7 and bit 4 of the bytes 5, 12, 19 or 26 (**status byte 1**) are saved from the time when the error appears until when the module is restarted. The fact that the fault was corrected is indicated by bit 5 in the case of a manual start; and by bit 6 in the case of an automatic start. If these errors are detected in the control unit, the entire **safemaster M** system is locked. If the input modules are error-free in the control unit or in the safety outputs, their bits 7 and 6 flash in the **status byte 1** (byte 12, 19 or 26) as well as their green LEDs until the error has been corrected in the control unit or in the safety outputs.

## Structure of Diagnostic Information

Assignment of "status byte 2" in the different modules of safemaster M

Control unit BH 5911:

Contents	Profibus DP byte no.	Mod.	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Status byte 2	6	Ct*	1 = start button activated for too long (>3s)	1 = one of the assigned start buttons has been activated	1 = emergency stop S14 activated	1 = emergency stop S12 activated	1 = error on output module 3	1 = error on output module 2	1 = error on output module 1	1 = error on the safety outputs of the Ct*

\* Ct = Control Unit, I.Mod. = Input Module

**Comment 1:** All signals are saved from the time when the error is detected until the safety outputs are released for activation again. The fact that the error was corrected is indicated in **status byte 1** (byte 5), bits 5 and 6.

**Comment 2:** In the case of a 2-channel emergency stop, bits 5 and 4 change together. For more precise diagnostics of the input signals, byte 3 (status of the inputs) must be evaluated.

Input module BG 5913.08/\_0\_ \_ \_ :

Contents	Profibus DP byte no.	Mod.	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Status byte 2	13 20 or 27 dep. on I.Mod. in safemaster M	I.Mod1* I.Mod2* I.Mod3*	1 = time error <sup>2)</sup>	1 = one of the assigned start buttons has been activated	1 = one of the assigned simulation buttons has been activated	0 (unused)	1 = function group 4 of module does not grant release <sup>1)</sup>	1 = function group 3 of module does not grant release <sup>1)</sup>	1 = function group 2 of module does not grant release <sup>1)</sup>	1 = function group 1 of module does not grant release <sup>1)</sup>

**Comments:** Except for bit 6 and 5, all signals are saved from the time when the error is detected until the assigned safety outputs are released for activation again. The fact that the error was corrected is indicated in **status byte 1** (no. 19, 20 or 26), bits 5 and 6.

- 1) The numbers of the different function groups match the numbering of the safety functions in the application examples of the data sheet of input module BG 5913.08/\_0\_ \_ \_ . If less than 4 functions are possible as a result of the input module setting (e.g. max. 2 with two-hand control type IIIC), the surplus bits are set to 0.
- 2) Time error is detected if the start or simulation buttons (>3s) are activated for too long. A time error message is also generated if two sensors of a function are not activated in the required time window (e.g. in the case of gates or two-hand controls).

Input module BG 5913.08/\_1\_ \_ \_ and BG 5913.08/\_2\_ \_ \_ , BG 5913.08/\_2\_ \_ \_ and BG 5913.08/\_3\_ \_ \_ :

Contents	Profibus DP byte no.	Mod.	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Status byte 2	13 20 or 27 dep. on I.Mod. in safemaster M	I.Mod1* I.Mod2* I.Mod3*	1 = time error <sup>2)</sup>	1 = one of the assigned start buttons or simulation buttons has been activated	0 (unused)	1 = function group 4 of module does not grant release <sup>1)</sup>	1 = function group 3 of module does not grant release <sup>1)</sup>	1 = function group 2 of module does not grant release <sup>1)</sup>	1 = function group 1 of module does not grant release <sup>1)</sup>	1 = function group 0 of module does not grant release <sup>1)</sup>

**Comments:** Except for bit 6, all signals are saved from the time when the error is detected until the assigned safety outputs are released for activation again. The fact that the error was corrected is indicated in **status byte 1** (no. 19, 20 or 26), bits 5 and 6.

- 1) The numbers of the different function groups match the numbering of the safety functions in the applications examples of the data sheet from input module. If a function combination with two-hand type IIIC is set on the input module, only 3 function groups are available and bit 3 is then always 0.
- 2) Time error is detected if the start or simulation buttons (>3s) are activated for too long. A time error message is also generated if two sensors of a function are not activated in the required time window (e.g. in the case of gates or two-hand controls).

## Structure of Diagnostic Information

Input module BG 5914.08/\_0\_ -->, BH 5914.08\_0\_ -->, BG 5914.08\_1\_ --> and BH 5914.08/\_1\_ -->

Contents	Profibus DP byte no.	Mod.	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Status byte 2	13 20 or 27 dep. on I.Mod. in safemaster M	I.Mod1* I.Mod2* I.Mod3* activated for too long (>3s)	1 = one of the assigned start buttons has been activated	1 = emergency stop on S14, S24, S34 or S44 does not grant release <sup>1)</sup>	1 = emergency stop on S42 or S44 does not grant release <sup>1)</sup>	1 = emergency stop on S42 or S44 does not grant release <sup>1)</sup>	1 = emergency stop on S32 or S34 does not grant release <sup>1)</sup>	1 = emergency stop on S22 or S24 does not grant release <sup>1)</sup>	1 = emergency stop on S32 or S34 does not grant release <sup>1)</sup>	1 = emergency stop on S12 or S14 does not grant release <sup>1)</sup>

**Comments:** Except for bit 6, all signals are saved from the time when the error is detected until the assigned safety outputs are released for activation again. The fact that the error was corrected is indicated in **status byte 1** (no. 12, 19 or 26), bits 5 and 6.

- 1) The emergency stop function which actually prevented the release can only be recognized from the combination of bit 5 with the bits 0 to 3. The current status of the inputs is always visible in byte 10, 17 or 24 (status of the inputs).
- 2) Bit 4 is only set if S42 and S44 are set for 2-channels for the emergency stop function, and both signals do not match.

## Interpretation Example for Diagnostic Information

We have a safemaster M system with the following components:

- 1 control unit BH 5911.03/00MFO
- 1 output module BG 5912.04
- 1 diagnostic module BH 5552 for Profibus DP

The transmitted information from diagnostic module BH 5552 is to be used in order to observe how and why the outputs of output module 1 change.

The available diagnostic information of the control unit and its changes are shown here:

### 1. Normal state: Safety outputs are activated, all EMERGENCY STOP buttons are released

	Bit no. 76543210	
Byte 1: Module number:	Hex: 01	Bin: 00000001
Byte 2: Assignments:	Hex: 13	Bin: 00010011
Byte 3: Status of inputs:	Hex: 00	Bin: 00000000
Byte 4: Status of outputs:	Hex: 00	Bin: 00000000
Byte 5: Status byte 1:	Hex: 45	Bin: 01000101
Byte 6: Status byte 2:	Hex: 00	Bin: 00000000
Byte 7: Start button and safety outputs:	Hex: 0B	Bin: 00000011

Module number 01 with deleted bit 4 shows that the entire safemaster M system is working properly.

The set bits 0 to 3 of status byte 1 show that the function switch of the control unit (module1) is set to position "5". That means that the following mode of operation is set:

2 x 1 channel emergency stop, manual start, 4 start buttons

The set assignments in byte 2 shows you that the control unit is started by the start button 1 (bit 4), and it has an effect on its own outputs (bit 0) and the outputs of output module 1 (bit 1). Since no input module is available, the outputs of both modules must always have the same status.

The set bit 6 in status byte 1 means the control unit grants the release for setting the safety outputs which are assigned to it. The fact that the outputs are actually set can be seen in byte 4.

### 2. Emergency stop button on S12 activated

	Bit no. 76543210	
Byte 1: Module number:	Hex: 01	Bin: 00000001
Byte 2: Assignments:	Hex: 13	Bin: 00010011
Byte 3: Status of inputs:	Hex: 01	Bin: 00000001
Byte 4: Status of outputs:	Hex: 0x	Bin: 000000xx = flash
Byte 5: Status byte 1:	Hex: 05	Bin: 00000101
Byte 6: Status byte 2:	Hex: 10	Bin: 00010000
Byte 7: Start button and safety outputs:	Hex: 00	Bin: 00000000

Bit 6 in status byte 1 shows that the control unit does not release the safety outputs which are assigned to it.

The reason for this is indicated by bit 0 in byte 3 (input S12 inactive) and by bit 4 in status byte 2 (emergency stop activated). The set bit 4 in byte 6 is saved until the release is granted again.

Byte 4 signals that the outputs have actually dropped out (bit 4 and 5) and the output 48 (bit 2) as well as the LED run 1 (bit 0) flash.

### 3. Emergency stop button is unlocked again

	Bit no. 76543210	
Byte 1: Module number:	Hex: 01	Bin: 00000001
Byte 2: Assignments:	Hex: 13	Bin: 00010011
Byte 3: Status of inputs:	Hex: 00	Bin: 00000000
Byte 4: Status of outputs:	Hex: 0x	Bin: 000000xx
Byte 5: Status byte 1:	Hex: 25	Bin: 00100101
Byte 6: Status byte 2:	Hex: 10	Bin: 00010000
Byte 7: Start button and safety outputs:	Hex: 00	Bin: 00000000

Since all inputs are in quiescent state again, only the status bytes 1 and 2 as well as byte 4 (status of outputs) still indicate that safemaster M was switched off. However, the saved bit 4 in status byte 2 still shows the reason for switch-off.

### 4. Start button T1 is activated

	Bit no. 76543210	
Byte 1: Module number:	Hex: 01	Bin: 00000001
Byte 2: Assignments:	Hex: 13	Bin: 00010011
Byte 3: Status of inputs:	Hex: 01	Bin: 00010000
Byte 4: Status of outputs:	Hex: 00	Bin: 00000000
Byte 5: Status byte 1:	Hex: 05	Bin: 00100101
Byte 6: Status byte 2:	Hex: 00	Bin: 00000000
Byte 7: Start button and safety outputs:	Hex: 00	Bin: 00000000

If the start button was activated properly (< 3 s), the system returns to the normal state described under section 1. If the start button is activated for too long (> 3 s), bit 7 would signal in byte 6.

#### Comment:

If a system was already put into operation, it is often sufficient just to evaluate status bytes 1 and 2.

Depending on the depth and degree of detail of the diagnostics, e.g. in the case of troubleshooting when placing the system into operation, the other bytes can also be included if required.

## Multi-Function Safety System SAFEMASTER M Output Module With Output Contacts BG 5912

0247388

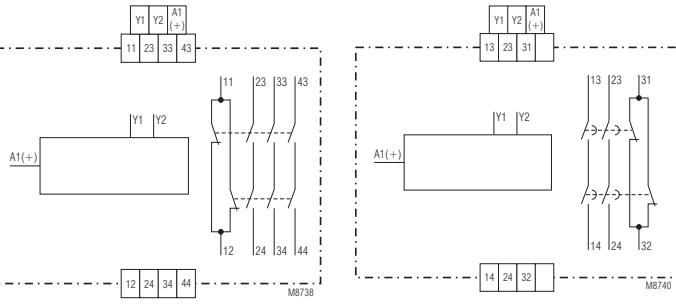

### Circuit Diagrams

BG 5912.86

BG 5912.04

BG 5912.48

BG 5912.95

### • According to

- Performance Level (PL) e and category 4 to EN ISO 13849-1: 2008
- SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
- Safety Integrity Level (SIL 3) to IEC/EN 61508

• Safety outputs can be assigned to one or several function modules (control unit or input modules).

### • Outputs:

- 4 NO contacts
- 3 NO contacts, 1 NC contact
- 3 NO contacts 0-3 s delay-release time-delay relay
- 2 NO contacts, 1 NC contact 0-3 s delay-release time-delay relay

• Permanently monitored feedback loop for external contact reinforcement

• LEDs for status indication

• Width 22.5 mm

### Approvals and Markings

### Applications

Realization of fail-safe control circuits for protection of people and machinery

### General Information SAFEMASTER M

The maximum configuration of the SAFEMASTER M multi-function safety system is as follows:

- the control unit BH 5911
- up to 3 input modules BG/BH 5913, or BG/BH 5914, BG/BH 5915
- up to 3 output modules BG 5912
- 1 diagnostic module BG 5551 for CANopen, or
- 1 diagnostic module BG 5552 for Profibus-DP

The BH 5911 controls the whole system.

The input/output modules can be used to expand the control unit in a modular way into a multi-functional safety system.

To transmit status messages of the individual modules to a monitoring or control unit, one of the following diagnostic modules may be connected:

- BG 5551 for CANopen
- BH 5552 for Profibus-DP

### Indication

Green LEDs

K1 and K2:

on, when the output contacts are activated

Yellow LED "Run":

on, when the unit operates without fault. Function errors are indicated by flashing codes.

Yellow LED "t":

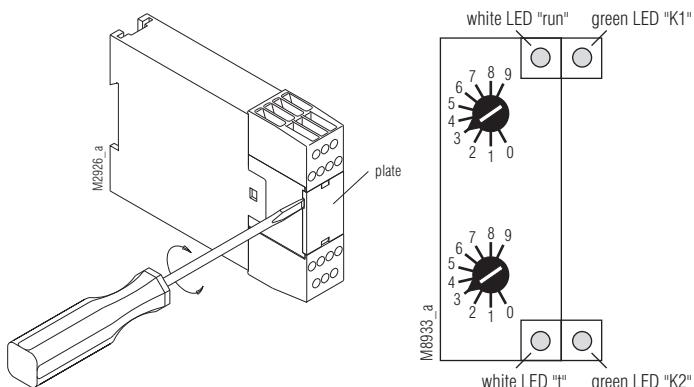

on, while the delay time is elapsing. Only applicable for delayed outputs.

## Setting of Functions

The instantaneous output modules are controlled directly by the control unit; no settings are required. The feedback input Y1-Y2 must be linked when no feedback is required. With contact reinforcement by external contactors, their forcibly guided NC contacts must be connected in series between Y1 and Y2.

With the delayed output modules the output contacts are activated immediately.

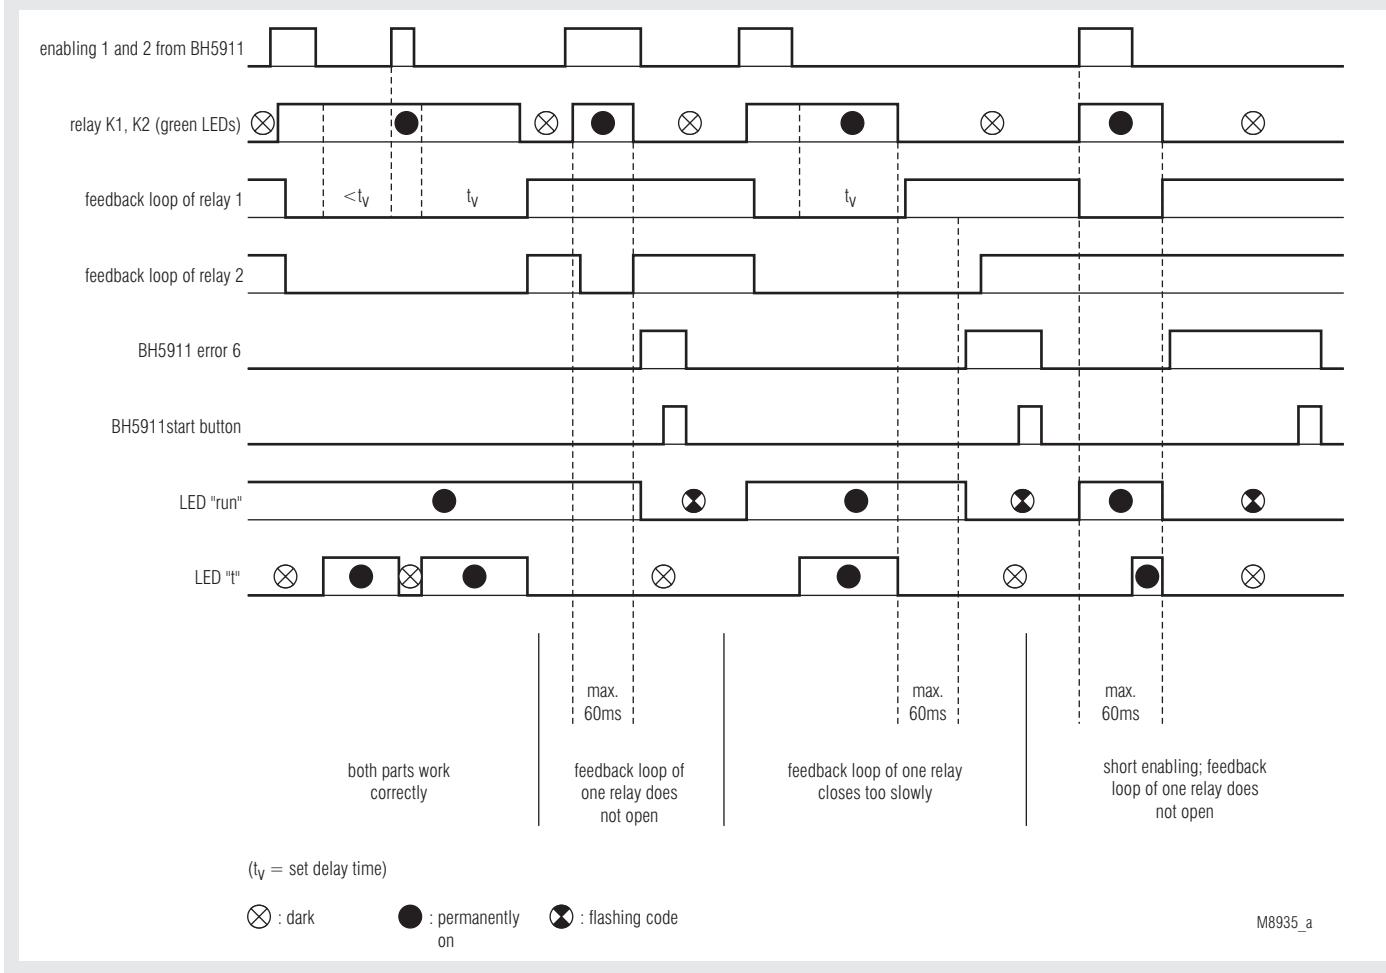

When the control signal is disconnected the outputs switch off after the adjusted time is elapsed (setting with 2 rotary switches).

## Notes

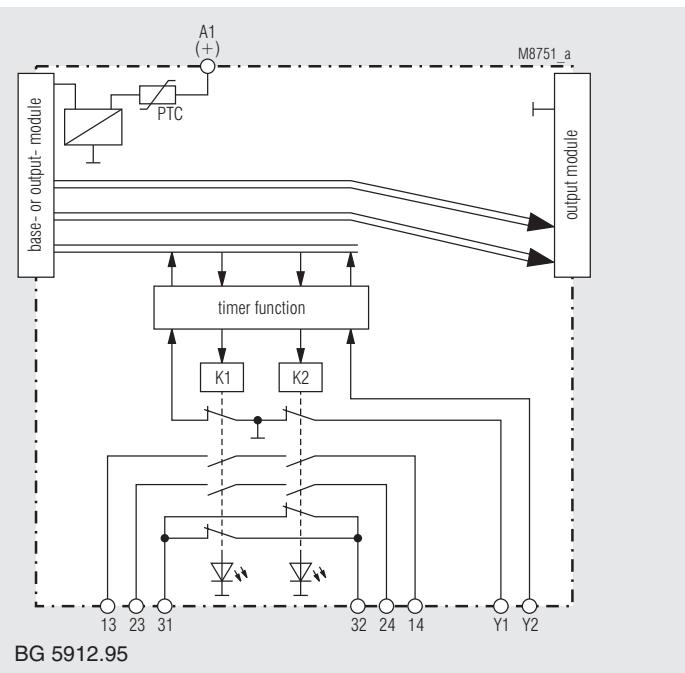

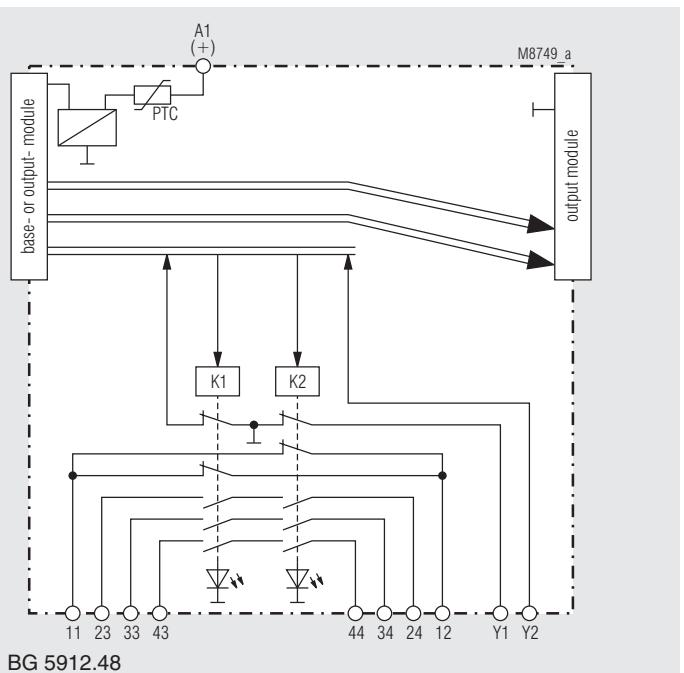

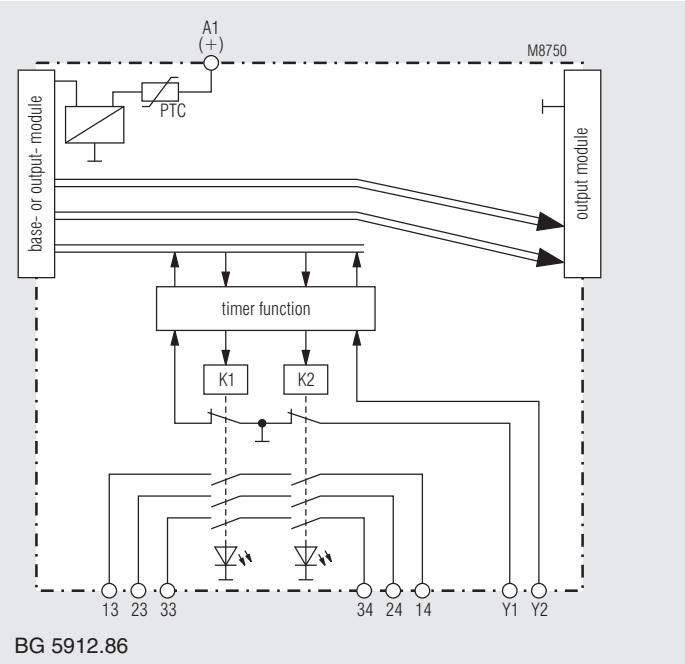

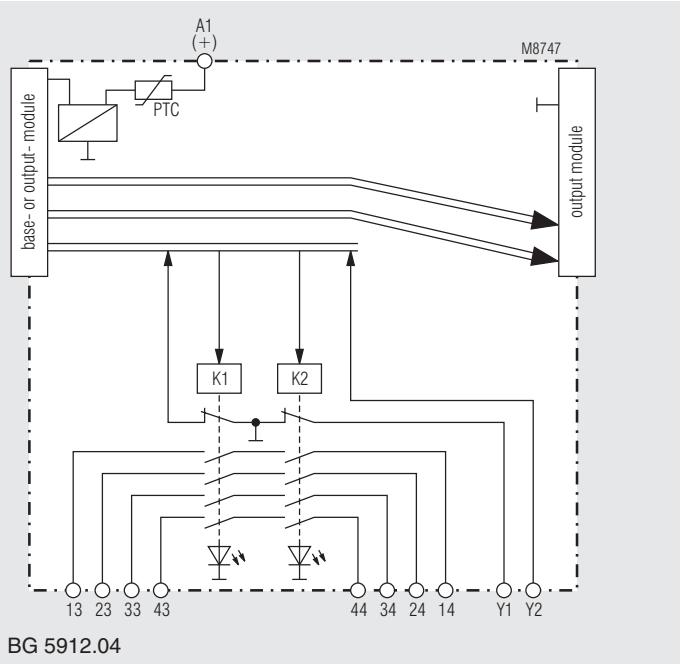

- Settings to the unit must be performed by skilled personnel while the unit is disconnected.
- Before the front cover is removed, antistatic precautions must be observed.

- SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
- Safety Integrity Level (SIL 3) to IEC/EN 61508

### • Input module for realization of

- 4 similar 2-channel inputs
- Emergency stop circuits
- Safety gate monitoring system
- Two-hand control type IIIA, IIIC acc. to DIN/EN 574
- Light curtain (LC type 4)

### • The functions are selected via rotary switch

### • 8 safety inputs

### • 2 semiconductor outputs for status indication

### • Broken wire and short circuit monitoring function with error indication

### • LEDs for status indication

### • Width

BG 5913.08/\_ \_ \_ : 22.5 mm

BH 5913.08/\_ \_ \_ : 45 mm

### Approvals and Markings

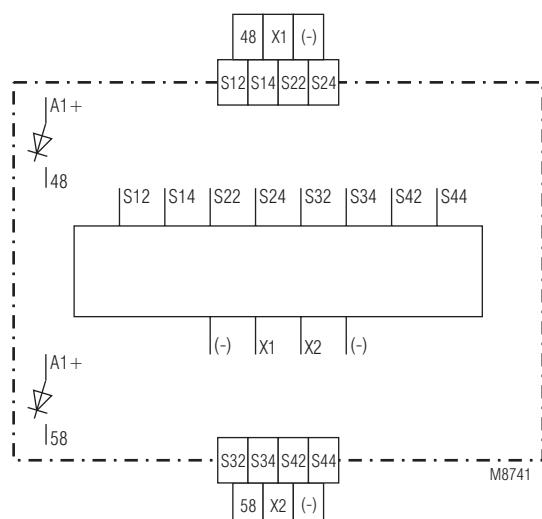

### Applications

Realization of fail-safe control circuits for protection of people and machinery.

Note: This module is intended for applications in which mixed safety functions affect one common output.

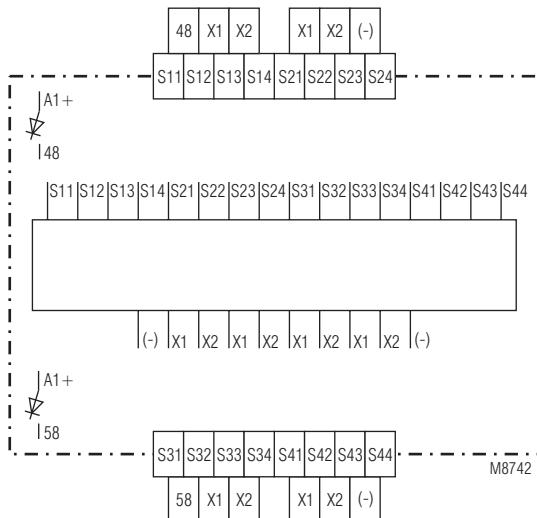

Further input modules with other combinations of functions are provided (e.g. BG 5913.08/\_ \_ \_, BG 5913.08/\_ \_ \_, BG 5913.08/\_ \_ \_, BG 5914.08/\_ \_ \_, BH 5914.08/\_ \_ \_ or BG 5914.08/\_ \_ \_).

### Circuit Diagrams

BG 5913

## Circuit Diagrams

BH 5913

## General Information SAFEMASTER M

The maximum configuration of the SAFEMASTER M multi-function safety system is as follows:

- the control unit BH 5911
- up to 3 input modules BG/BH 5913, or BG/BH 5914, BG/BH 5915
- up to 3 output modules BG 5912
- 1 diagnostic module BG 5551 for CANopen, or
- 1 diagnostic module BG 5552 for Profibus-DP

The BH 5911 controls the whole system.

The input/output modules can be used to expand the control unit in a modular way into a multi-functional safety system.

To transmit status messages of the individual modules to a monitoring or control unit, one of the following diagnostic modules may be connected:

- BG 5551 for CANopen
- BH 5552 for Profibus-DP

## Notes

In respect of function and settings, the modules BG 5913 and BH 5913 are completely identical.

- The modules BG 5913 have 8 inputs with one common ground. This is the ground of the overall system. They are suitable for all applications in which volt free contacts are used, or where there is a common ground (e.g. 2-channel light curtains). They need only 8 terminals and thus only have an overall width of 22.5 mm.
- The modules BH 5913 have 8 completely DC-decoupled inputs. This allows with setting 1 and 3 (4 lightcurtains) to connect also 4 two-channel e-stop buttons with long connection wires with static signal potential. Here, short-circuit monitoring is effected by a certain type of wiring according to the application examples.

## Indication

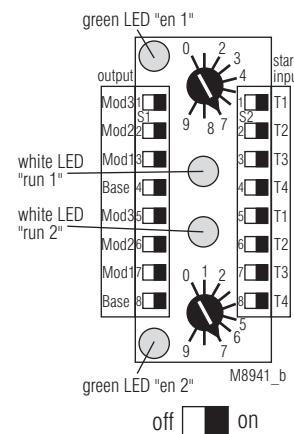

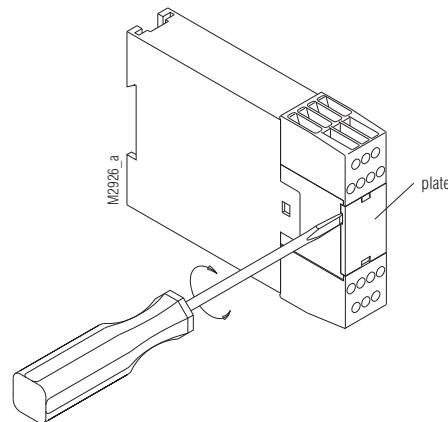

Green LEDs: on, when all inputs are present and start button activated.

White LEDs Run1/Run 2 and outputs 48 and 58: indicate the current status of the module.

## Setting of the Module

The module is assigned to the start inputs and the safety outputs via the DIP switches.

The combinations of individual functions are set via the rotary switches. To prevent accidentally adjustments, these elements are covered by a front plate and are redundant.

Note:

- Settings to the unit must be performed by skilled personnel while the unit is disconnected.
- Before the front cover is removed, antistatic precautions must be observed.

## Setting of the Modules

Sw.	Function
0	4 Emergency stop 2-channel, autostart
1	4 light curtains category 4, autostart
2	4 Emergency stop 2-channel, manual start
3	4 light curtains category 4, manual start
4	4 safety gates with 2 single contacts
5	2 safety gates with 2 changeover contacts
6	1 safety gate with 2 twin contacts and 1 single contact, manual start (plastic injection moulding machines) to EN 201
7	1 safety gate with 3 twin contacts, manual start (plastic injection moulding machines) to EN 201
8	4* two-hand control IIIA acc. to EN 574
9	2* two-hand control IIIC acc. to EN 574

When using setting 8 or 9 the user has to indicate clearly on the device which type of 2-hand function is adjusted (IIIA or IIIC).

## Automatic Start

Automatic start is performed only when supply voltage is switched on, or when the emergency stop or stop function has been reset. All other errors nevertheless require confirmation by a start input.

## Manual Start

To start the system, do not keep the start key pressed for more than 3 seconds. A module may also be assigned several start keys.

## One-Channel Input

With setting 6), it is imperative to use a voltfree contact for the single contact. A static signal cannot be used.

## Simulation Input for Function of Safety Gates

When the unit is set to monitor safety gates according to EN 201 switch position 4, 5, 6 and 7, closing of the assigned safety outputs is only enabled, if every gate has changed from open state (all contacts inactive) to closed state within a maximum period of 3 sec on each gate.

When the system is powered up with some gates open and some closed the open gates can be closed and the system can be started up by the simulation button, simulating an open-close cycle of the previously closed gates.

Only those gates are simulated, that had been closed before the system was powered up.

Simulation is only possible once after the unit is powered up. After that all contacts of a gate have to be opened and reclosed to enable the outputs again. When closing the gate all contacts of a gate have to close within 3 sec.

## Function of the Two-Hand Control

Up to 4 pairs of two-hand safety circuits can be connected with the two-hand safety function. However, no more than one circuit may be activated. To permit enabling of the assigned safety outputs, the following conditions must be fulfilled:

- 1) First, none of the connected two-hands circuits must be activated.
- 2) Both buttons of a two-hand control must be pressed within 0.5 s.
- 3) When changeover contacts (type IIIC acc. to DIN / EN 574) are used for the two-hand-safety buttons, they must effect changeover of contacts within 50 ms.
- 4) As soon as a button of a second two-hand circuit is pressed, the outputs are disabled, and condition 1) must be fulfilled once more before a new enabling cycle can start.
- 5) The two-hand buttons have to be released if an other function module, also assigned to the same outputs disables the outputs.
- 6) Only one two-hand control module is allowed in one safemaster M system.

The unit must be connected as specified in the application examples. When the operating contacts are connected in parallel or in series, safe functioning of the unit is cancelled.

The two-hand buttons must be designed and arranged in such a way as to ensure that they cannot be disabled easily, or pressed unintentionally.

The safety distance between the push buttons and the place of danger must be large enough to insure that after releasing a button, the place of danger can only be reached after the dangerous movement has stopped. The safety distance "S" is calculated according to the following formula:

## Function of the Two-Hand Control

$$S = V \times T + C, \text{ where}$$

- a) gripping velocity  $V = 1\ 600 \text{ mm/s}$
- b) overtravel time  $T (\text{s})$
- c) and safety factor  $C = 250 \text{ mm}$ .

When any access into the dangerous area, with operating keys pressed, is safely prevented, e.g. by a protective cover for the keys, the safety factor C may be set to the value 0. Generally, the minimum safety distance must be 100 mm. See also DIN/EN 574.

## Safety Gate Function

The safety gate function always permits enabling if both contacts change from inactive to active state within 3 seconds. If the second contact reacts later, both changeover contacts must turn inactive before they can be enabled again.

When activating the system, press the start button to simulate the compulsory opening and re-closing of safety gates which have been kept closed since the system has started.

This simulation is possible only before enabling has been permitted for the first time, and as long as both safety gate contacts remain closed as well. As soon as a contact opens, simulation of the safety gate function is no longer possible.

## E-Stop or Light Curtain (LC) Function

In the Emergency stop or LC functions, both signals have to change from inactive state into active state within 250 ms. If the second signal reacts later, both changeover contacts must turn inactive before they can be enabled again.

With manual start, all safety inputs must be active before the start button can be pressed to trigger enabling. To start the system, do not keep the start button pressed for more than 3 seconds. A module may also be assigned several start buttons.

**Note:** Connect only self-testing light curtains of the type 4 acc. to EN 61496 to the module. Short-circuit monitoring of the inputs for the LC must be done in the LC.

## Indication of System Errors:

These errors are indicated by flashing codes of the white LEDs Run 1 and/or Run 2. The green LEDs and all outputs turn inactive. The system will only restart after the supply voltage has been switched off and on again.

### Error codes\*

- 0) (both white LEDs are off):  
Another input module indicates a system error.
- 1) To 4): not used
- 5) Incorrect setting of function:
  - The rotary switches for channel 1 and 2 have different or incorrect positions
  - The setting of the 4 upper Dip-switches (channel 1) are not identically to the 4 lower Dip-switches (channel 2)
- 6) LED Run 1 flashes: Undervoltage  
LED Run 2 flashes: Overvoltage
- 7), 8) Not used
- 9) Connection error between the input modules  
No terminating connector available.
  - . Control or input module defective
- 10), 11), 12), 13) a. 14) Internal errors

\* number of short flashing impulses, followed by a longer space

## Indication

	Permanently OFF	Pulsing	Permanent ON
Output 48	all relays inactive due to system error	one input function not available	Activation of the assigned safety outputs is permissible
LED Run 1	Two-hand control not activated (LED run 2 ON) or all relays inactive due to system error	one input function not available (LED run 2 ON) or system error when LED Run 2 is OFF or flashing	Activation of the assigned safety outputs is permissible
Output 58	Activation of the assigned safety outputs is permissible or system error	Error exists no more, waiting for Start input	one input function not available
LED Run 2	all relays inactive due to system error	all relays inactive due to system error	No system error

## Function Error Indication

Function errors are indicated by the white LED Run 1 and by output 48; the white LED Run 2 remains on. Output 58 is ON as long as the error is pending; it flashes regularly, while waiting for the assigned start signal.

### Error codes\*

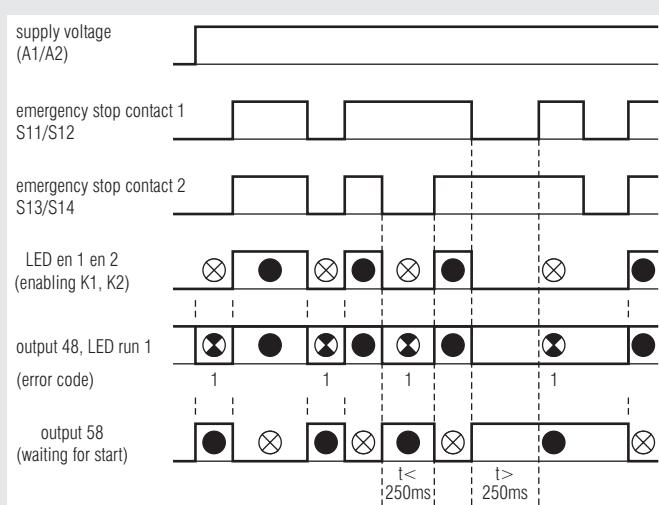

- 1) Normal interruption of function (e.g. Emergency stop)
- 2) Time error: (e.g. the second two-hand button is not pressed)
- 3) With gate monitoring: simulation input error (kept pressed for too long)
- 4) Error at start input
- 5) Input error (short-circuit, interruption)
- 6) Error in the control unit (input or output error detected in the control unit)

\* number of short flashing impulses, followed by a longer space

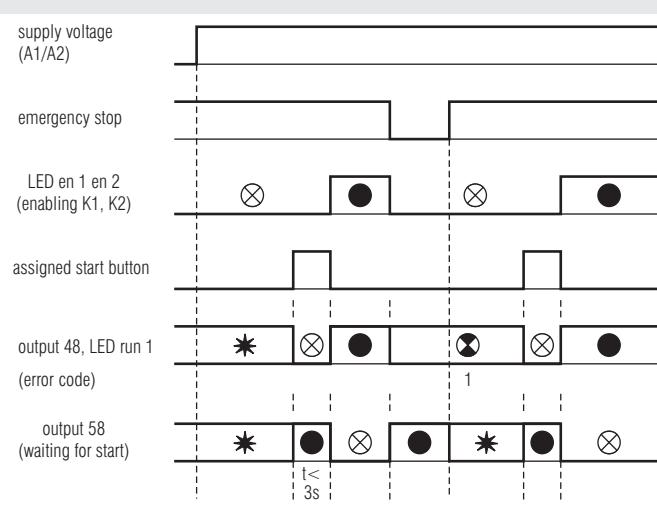

### Special with two-hand control:

When both two-hand buttons of the module are inactive while all other functions are active and enabled either by autostart or via the start button, output 48 and the white LED Run 1 are permanently OFF, and output 58 permanently ON.

## Function Diagramms

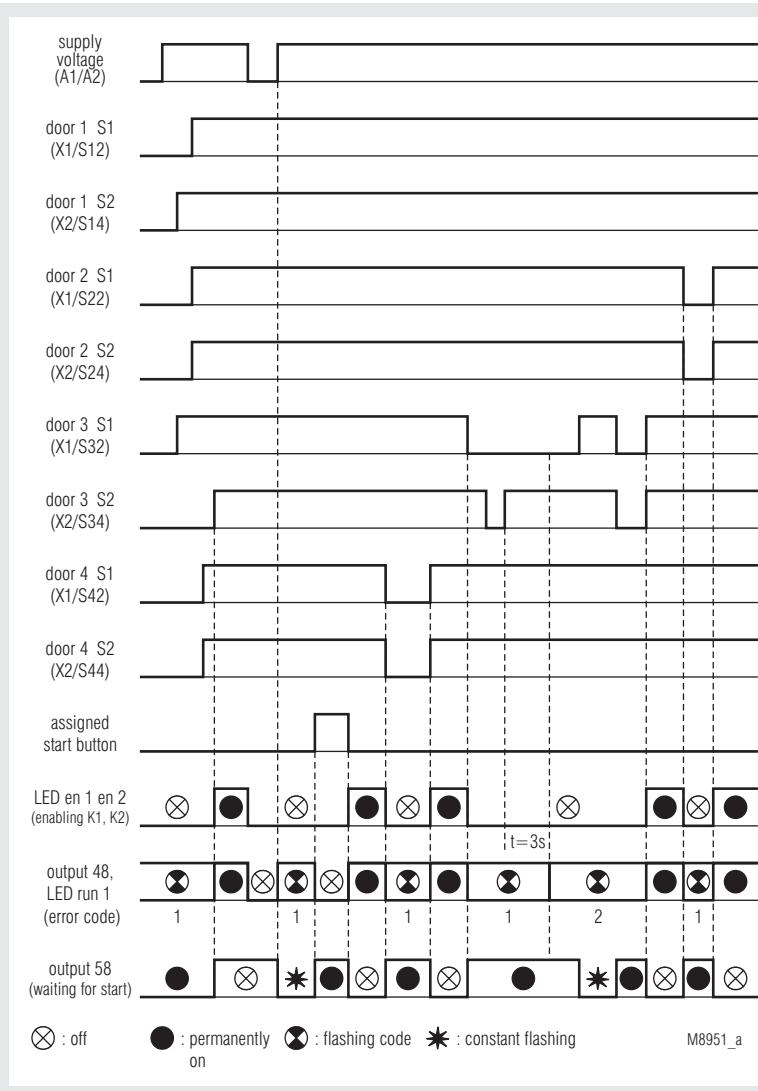

Emergency stop or light curtain, automatic start

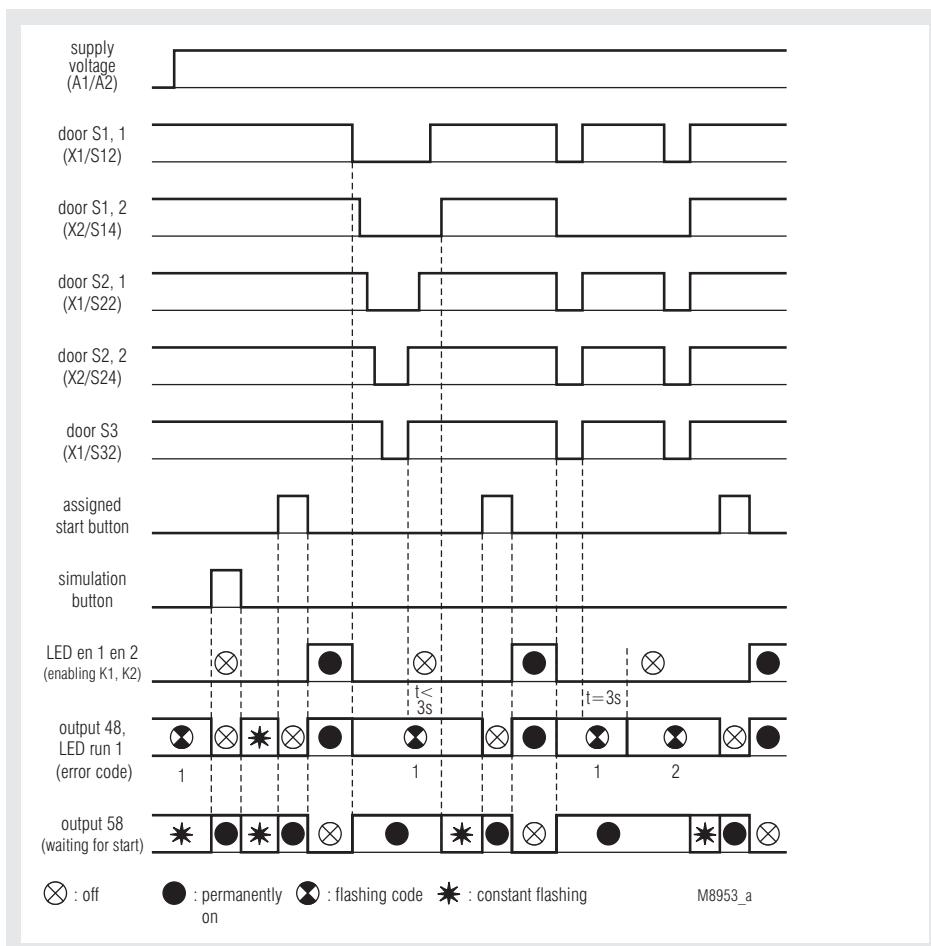

Emergency stop or light curtain, manual start

## Function Diagramms

## Application Examples

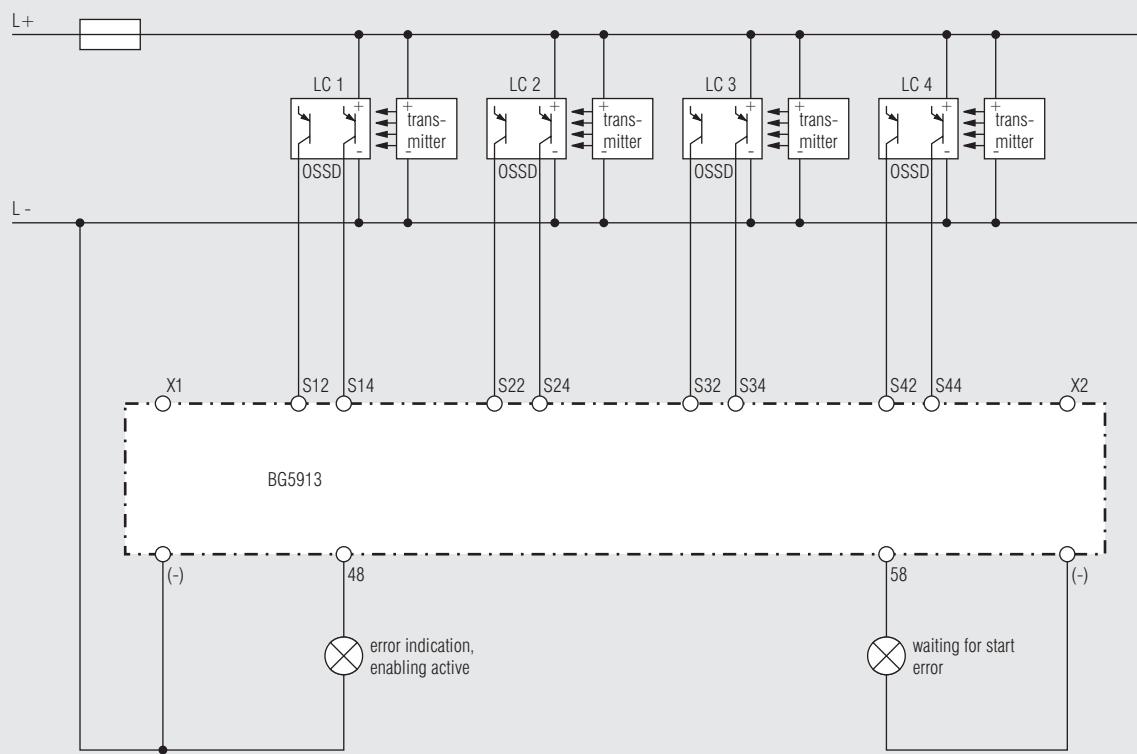

4 Emergency stop circuits, 2-channel, auto/manual start with short circuit monitoring; function: 0, 2

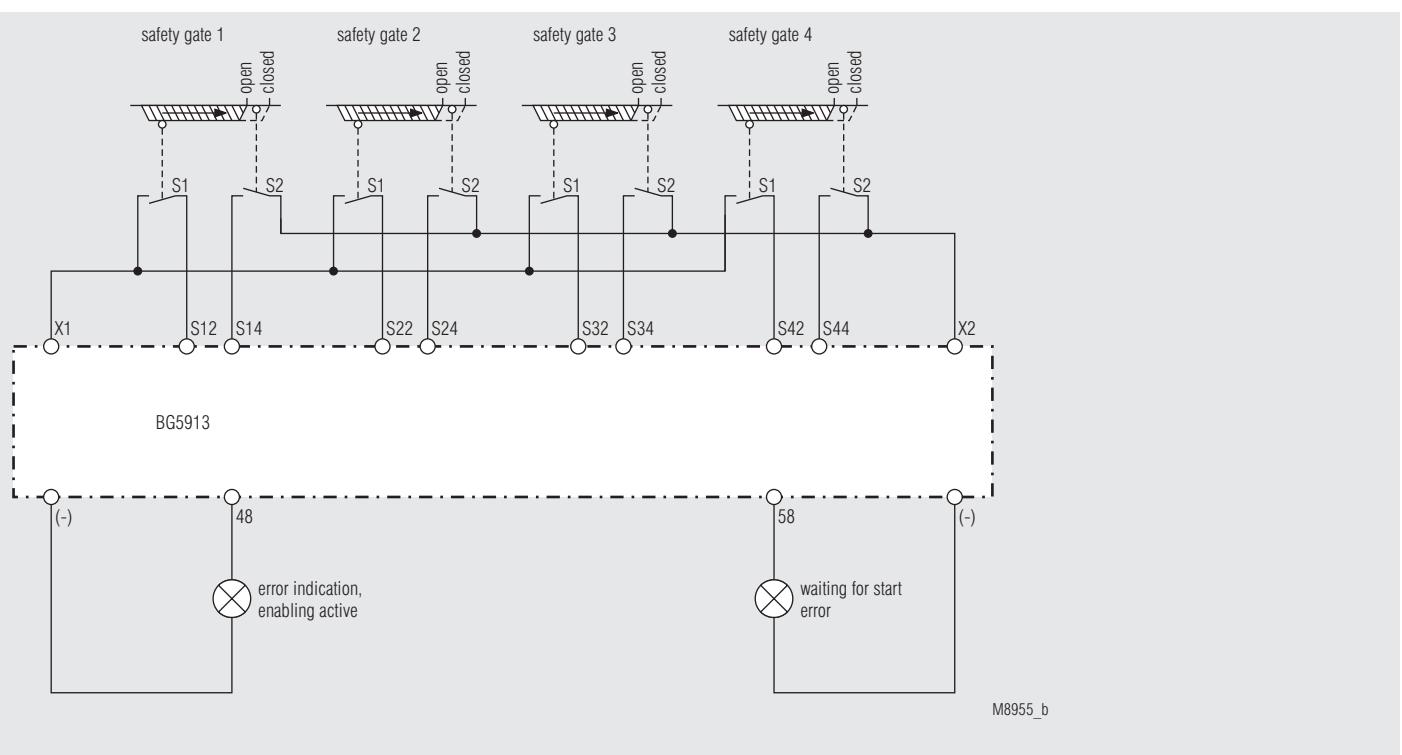

4 Emergency stop circuits, 2-channel, auto/manual start, short circuit monitoring by wiring; function 1, 3

## Application Examples

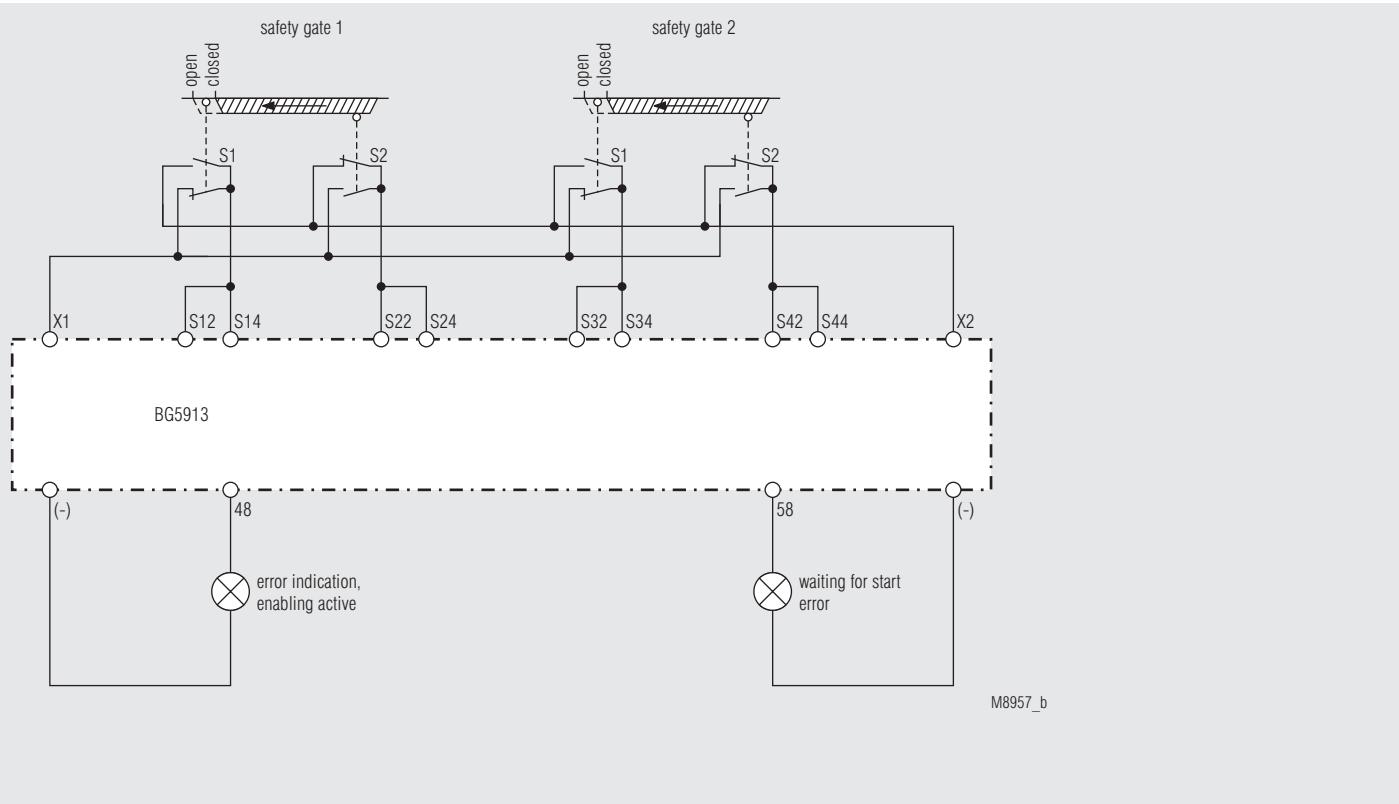

4 light curtains, category 4, auto/manual start; function: 1,3

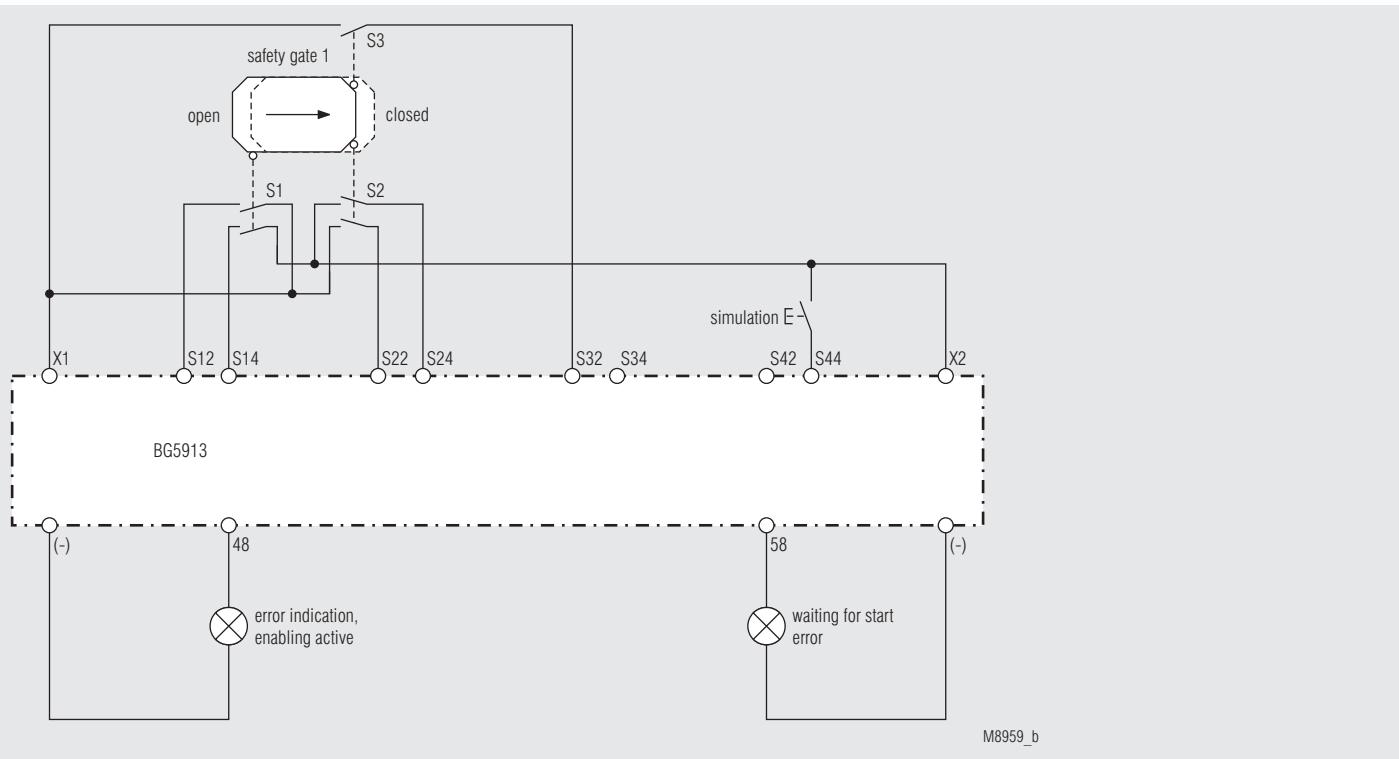

4 safety gates with 2 NO contacts; function: 4

## Application Examples

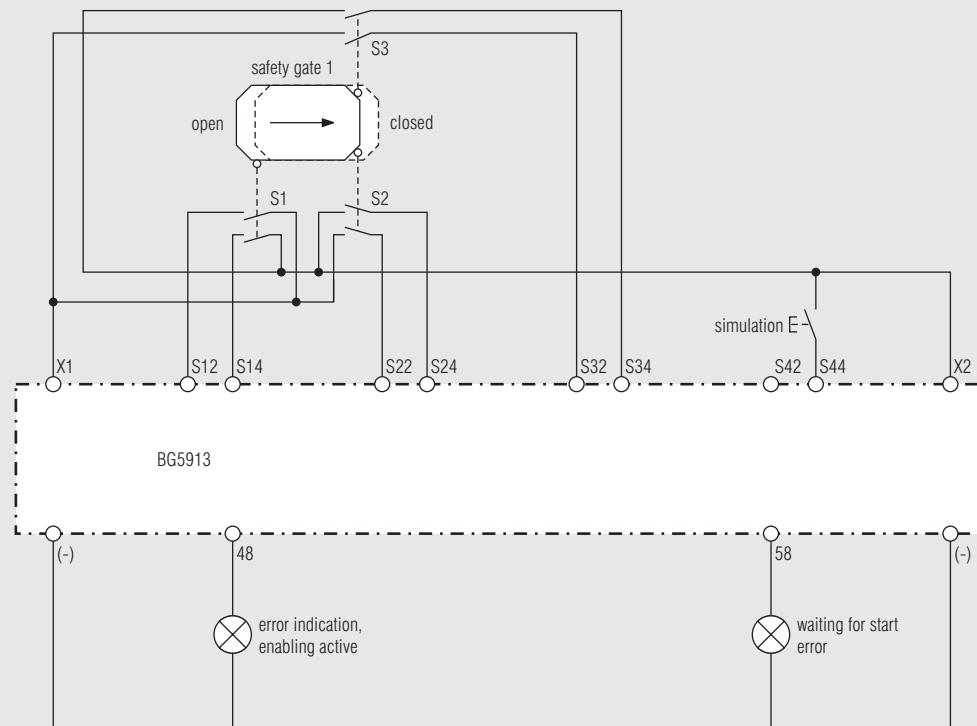

2 safety gates with 2 antivalent changeover contacts each; function: 5

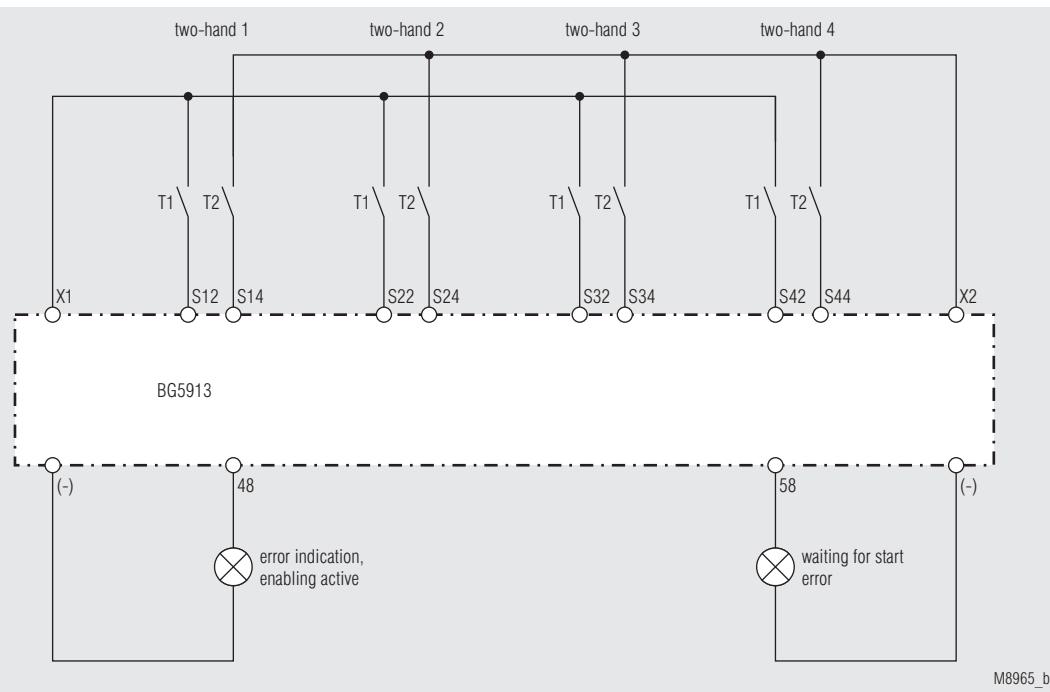

1 safety gate with 2 twin/1 single contact, manual start (plastic injection moulding machines); function: 6

## Application Examples

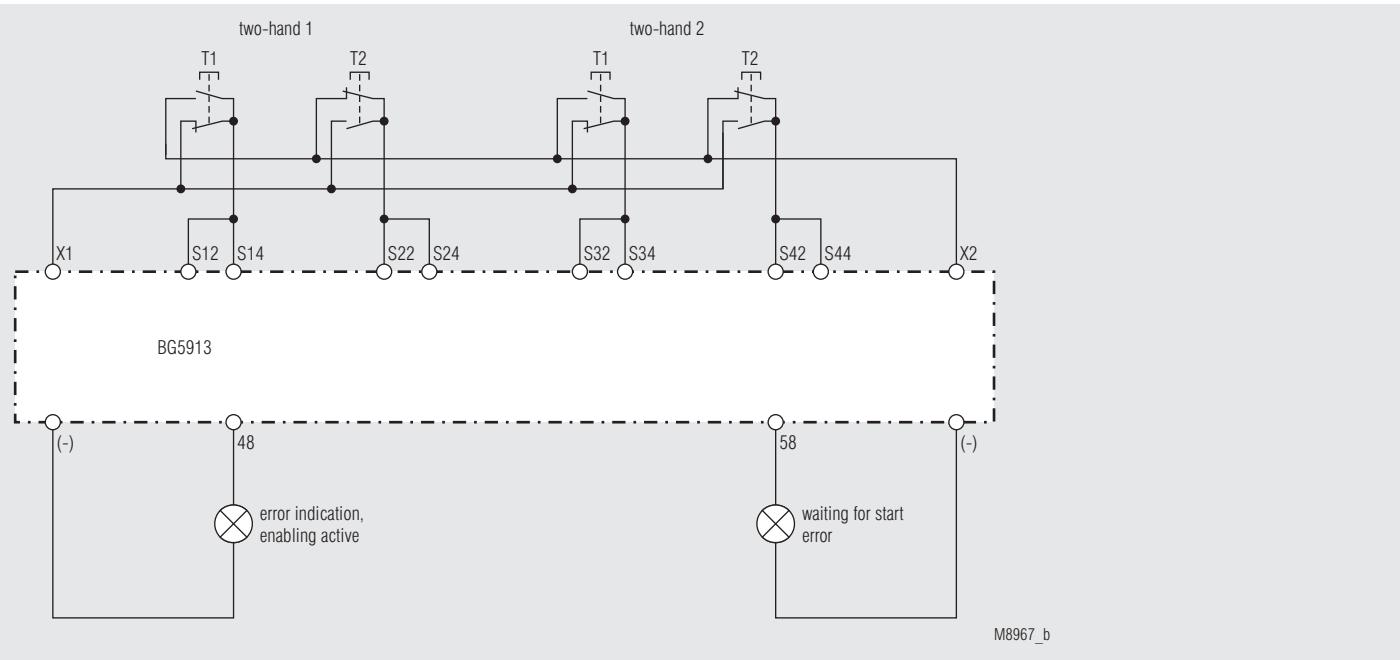

1 safety gate with 3 twin contacts, manual start (plastic injection moulding machines); function: 7

4 two-hand controls type IIIA acc. to DIN/EN 574; function: 8

## Application Examples

2 two-hand controls type IIIC acc. to DIN/EN 574; function: 9

### Technical Data

#### Voltage Supply

**Nominal voltage  $U_N$ :** DC 24 V (coming from the basic module BH5911)

#### Voltage range:

with max. 5% residual ripple: 0.85 ... 1.15  $U_N$

**Nominal consumption:** max. 60mA  
(no load on semiconductor outputs)

**Short-circuit protection**  
of the modules: internally with PTC

#### Input

##### Control voltage

via X1, X2, 48.58: DC 23 V at  $U_N$

##### Control voltage

via S12, S14, S22, S24,  
S32, S34, S42, S44: 4.5 mA each at  $U_N$

##### Minimum voltage

on S12, S14, S22, S24,  
S32, S34, S42, S44: DC 16 V

#### Semiconductor Outputs

Output at terminal 48 and 58: Transistor outputs, plus-connected  
Output nominal voltage: DC 24 V, max. 100 mA constant current,  
max. 400 mA for 0.5 s  
Internal short circuit, overtemperature, and  
overload protection

#### Reaction Times (time till reaction of the assigned output):

##### Typ. NO time with $U_N$ :

Input modules BG 5913	Manual start	Automatic start	
		First start	Restart
Emergency stop	max. 80 ms	max. 1 s	max. 115 ms
Light barriers	max. 80 ms	max. 1 s	max. 115 ms
Safety gates	or simulation: max. 80 ms		Gate closing: max. 115 ms
Two-hand control	max. 85 ms		

### Technical Data

#### Break Time (reaction time):

Input modules BG 5913	
Emergency stop	max. 33 ms
Light barriers	max. 33 ms
Safety gates	max. 33 ms
Two-hand control	max. 33 ms

#### General Data

##### Operating mode:

Continuous operation

$\pm 0 \dots + 50^\circ\text{C}$

At an operating temperature of  $50^\circ\text{C}$   
the modules must be mounted with  
a distance of 3 - 5 mm.

##### Clearance and creepage distances

rated impulse voltage /

pollution degree: 4 kV / 2 (basis insulation) IEC 60 664-1

**EMC:** IEC/EN 61 326-3-1, IEC/EN 62 061

Radio interference suppression: Limit value class A EN 55011

**Remark:** This device is designed for industrial ambient conditions.  
When used in other environment, it is possible that wire bound or  
radiated interference occurs.

# Safety Technique

## Multi-Function Safety System SAFEMASTER M

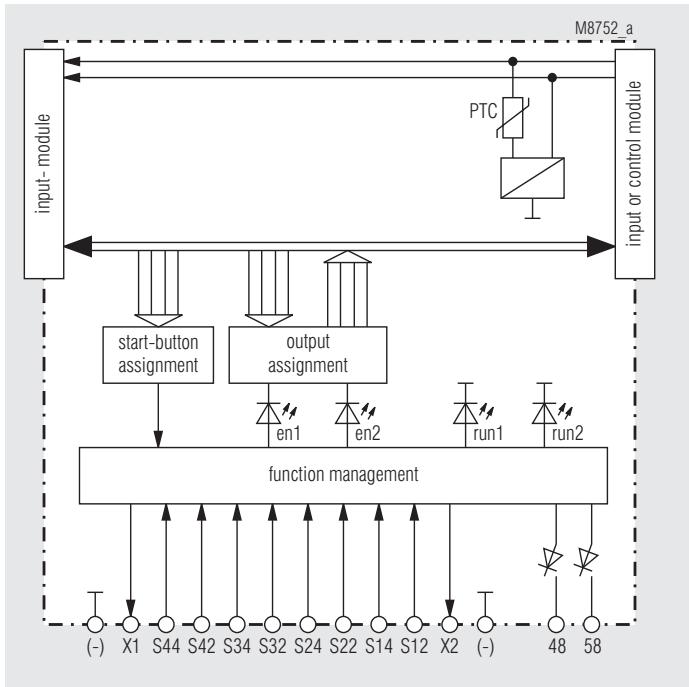

Input Module  
BG 5913.08/\_1

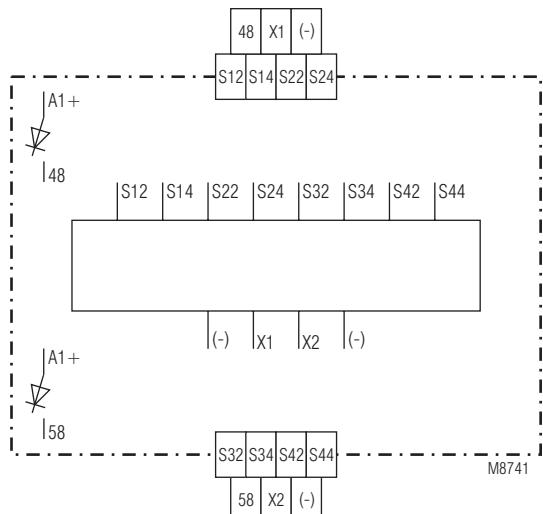

0247386

### Block Diagram

### Circuit Diagram

#### According to

- Performance Level (PL) e and category 4 to EN ISO 13849-1: 2008
- SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
- Safety Integrity Level (SIL 3) to IEC/EN 61508
- Input module for realization of
  - 4 mixed 2-channel inputs
  - Emergency stop circuits
  - Safety gate monitoring system
  - Two-hand control type IIIA, IIIC acc. to DIN/EN 574
  - Light curtain monitoring system (LC type 4)
- The functions are selected via rotary switch
- 8 safety inputs
- 2 semiconductor outputs for status indication
- Broken wire and short circuit monitoring function with error indication
- LEDs for status indication
- Width: 22.5 mm

### Approvals and Markings

### Applications

Realization of fail-safe control circuits for protection of people and machinery.

**Note:** This module is intended for applications in which mixed safety functions affect one common output.

Further input modules with other combinations of functions are provided (e.g. BG 5913.08/\_1, BG 5913.08/\_2, BG 5913.08/\_3, BG 5914.08/\_1, BH 5914.08/\_1, BG 5914.08/\_1, BG 5915/\_1 or BH 5915.08/\_1).

### General Information SAFEMASTER M

The maximum configuration of the SAFEMASTER M multi-function safety system is as follows:

- the control unit BH 5911
- up to 3 input modules BG/BH 5913, BG/BH 5914, BG/BH 5915
- up to 3 output modules BG 5912
- 1 diagnostic module BG 5551 for CANopen, or
- 1 diagnostic module BG 5552 for Profibus-DP

The BH 5911 controls the whole system.

The input/output modules can be used to expand the control unit in a modular way into a multi-functional safety system.

To transmit status messages of the individual modules to a monitoring or control unit, one of the following diagnostic modules may be connected:

- BG 5551 for CANopen
- BH 5552 for Profibus-DP

### Indicators

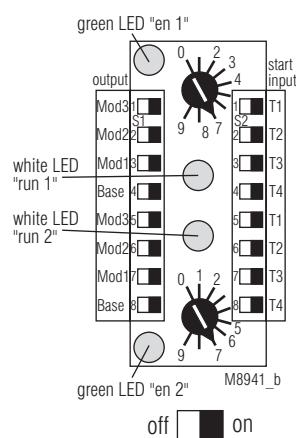

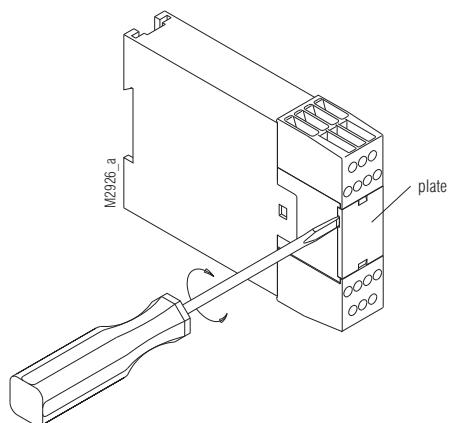

Green LEDs: on, when all inputs are present and start button activated.

White LEDs Run1/Run 2 and outputs 48 and 58: indicate the current status of the module.

## Setting of the Module

The module is assigned to the start inputs and the safety outputs via the DIP switches.

The combinations of individual functions are set via the rotary switches. To prevent accidentally adjustments, these elements are covered by a front plate and are redundant.

### Note:

- Settings to the unit must be performed by skilled personnel while the unit is disconnected.
- Before the front cover is removed, antistatic precautions must be observed.

## Setting of the Modules

Sw.	Function at Terminals				Start behavior of the LC / E-Stop
	S12-S14	S22-S24	S32-S34	S22-S24	
0	Gate	Gate	Gate	LC	Autostart
1	Gate	Gate	Gate	LC	Manual Start
2	Gate	Gate	LC	LC	Autostart
3	Gate	Gate	LC	LC	Manual Start
4	Gate	LC	Two-hand IIIC		Autostart
5	Gate	LC	Two-hand IIIC		Manual Start
6	Gate	E-stop	Two-hand IIIC		Autostart
7	Gate	E-stop	Two-hand IIIC		Manual Start
8	Gate	LC	LC	LC	Autostart
9	Gate	LC	LC	LC	Manual Start

## Functional Principle of Combined Inputs

Each function activates an enabling signal in the module software. The control unit is permitted to enable the assigned safety outputs only after all 3 (for two-hands control) or 4 enablings have been given.

With the exception of two-hand control, each function works independently. The assigned safety outputs are enabled if the precondition for enabling has been met for all functions.

## Function of the Two-Hand Control

This function will only work when the other two functions have already permitted enabling. To provide for enabling, the two buttons must be pressed within 0.5 s. As soon as one of the other function reacts, the two buttons must turn inactive before the others can be enabled again. Only after that, the buttons can be activated once more from an inactivated state.

The unit must be connected as specified in the application examples. When the operating contacts are connected in parallel or in series, safe functioning of the unit is cancelled.

The two-hand buttons must be designed and arranged in such a way as to ensure that they cannot be disabled with easily, or pressed unintentionally.

The safety distance between the push buttons and the place of danger must be large enough to make sure that after releasing a button, the place of danger can only be reached after the dangerous movement has stopped.

The safety distance "S" is calculated according to the following formula:

$$S = V \times T + C, \text{ where}$$

- a) gripping velocity  $V = 1\,600 \text{ mm/s}$
- b) overtravel time  $T (\text{s})$
- c) and safety factor  $C = 250 \text{ mm}$ .

When any access into the danger area, with operating keys pressed, is safely prevented, e.g. by a protective cover for the keys, the safety factor C may be set to the value 0. Generally, the minimum safety distance must be 100 mm. In this respect, also see DIN/EN 574.

The two-hand control must be released when another function module which affects the same outputs does not permit enabling.

The system may comprise only one function module with two-hand control.

## Safety Gate Function

The safety gate function always permits enabling if both contacts change from inactive to active state within 3 seconds. If the second contact reacts later, both changeover contacts must turn inactive before they can be enabled again.

When activating the system, press the start button to simulate the compulsory opening and re-closing of safety gates which have been kept closed since the system has started.

This simulation is possible only before enabling has been permitted for the first time, and as long as both safety gate contacts remain closed as well. As soon as a contact opens, simulation of the safety gate function is no longer possible.

## E-Stop or Light Curtain (LC) Function

In the Emergency stop or LC functions, both signals have to change from inactive state into active state within 250 ms. If the second signal reacts later, both changeover contacts must turn inactive before they can be enabled again.

With manual start, all safety inputs must be active before the start button can be pressed to trigger enabling. To start the system, do not keep the start button pressed for more than 3 seconds. A module may also be assigned several start buttons.

**Note:** Connect only self-testing light curtains of the type 4 acc. to EN 61496 to the module. Short-circuit monitoring of the inputs for the LC must be done in the LC.

## Indication of System Errors:

These errors are indicated by flashing codes of the white LEDs Run 1 and/or Run 2. The green LEDs and all outputs turn inactive. The system will only restart after the supply voltage has been switched off and on again.

### Error codes\*

- 0) (both white LEDs are off):  
Another input module indicates a system error.
- 1) To 4): not used
- 5) Incorrect setting of function:
  - The rotary switches for channel 1 and 2 have different or incorrect positions
  - The setting of the 4 upper Dip-switches (channel 1) are not identically to the 4 lower Dip-switches (channel 2)
- 6) LED Run 1 flashes: Undervoltage  
LED Run 2 flashes: Overvoltage
- 7), 8) Not used
- 9) Connection error between the input modules  
No terminating connector available.  
· Control or input module defective
- 10), 11), 12), 13) a. 14) Internal errors

\* number of short flashing impulses, followed by a longer space

## Function Error Indication

Function errors are indicated by the white LED Run 1 and by output 48; the white LED Run 2 remains on. Output 58 is ON as long as the error is pending; it flashes regularly, while waiting for the assigned start signal.

### Error codes\*

- 1) Normal interruption of function (e.g. Emergency stop)
- 2) Time error: (e.g. the second two-hand button is not pressed)
- 3) With gate monitoring: simulation input error (kept pressed for too long)
- 4) Error at start input
- 5) Input error (short-circuit, interruption)
- 6) Error in the control unit (input or output error detected in the control unit)

\* number of short flashing impulses, followed by a longer space

### Special with two-hand control:

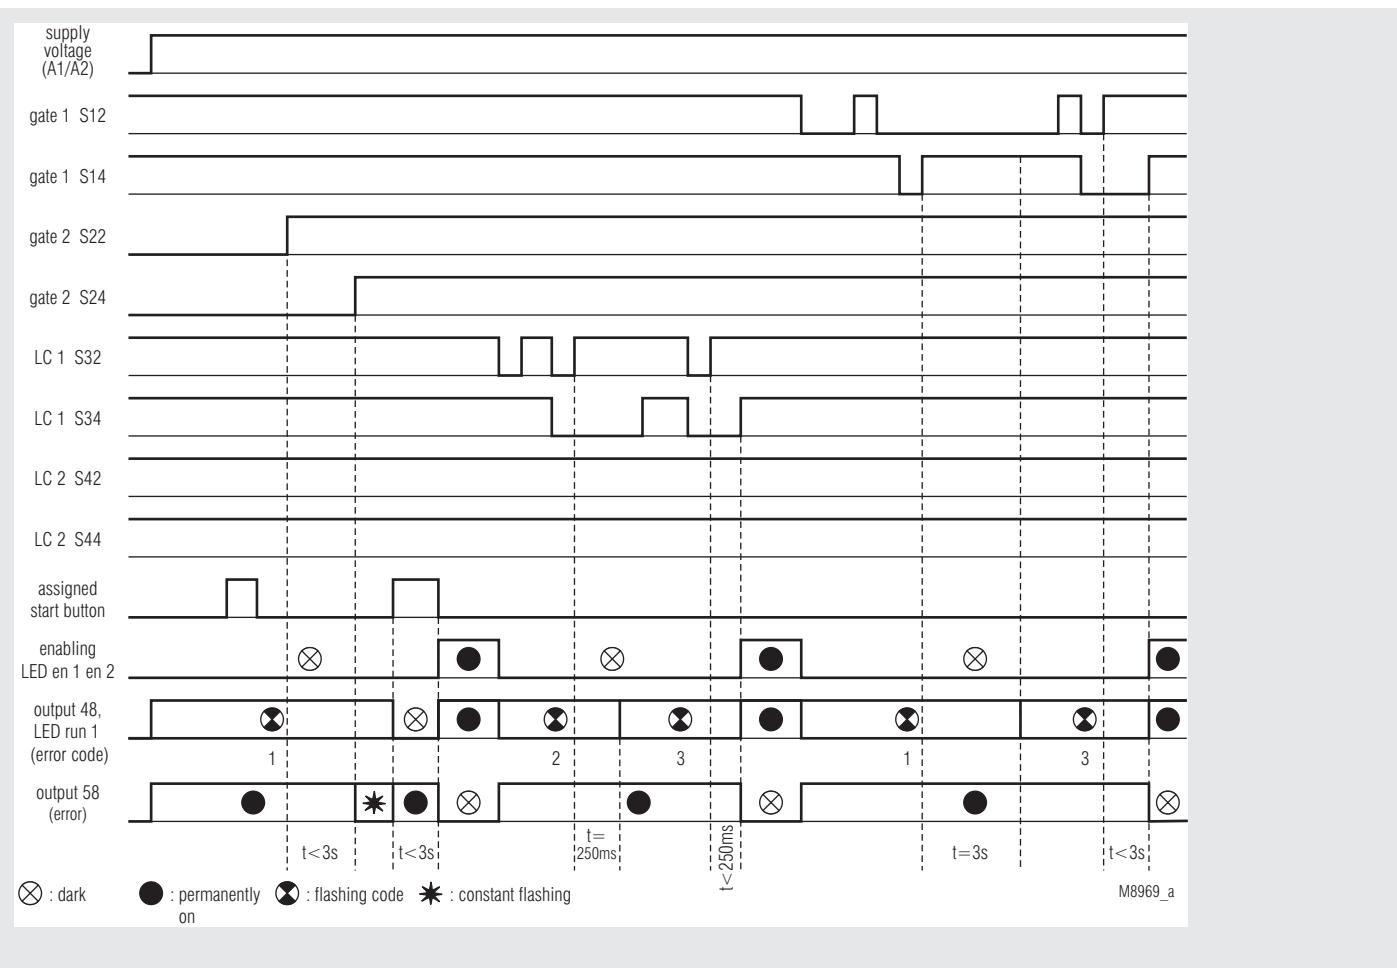

When both two-hand buttons of the module are inactive while all other functions are active and enabled either by autostart or via the start button, output 48 and the white LED Run 1 are permanently OFF, and output 58 permanently ON.

## Indicators

	Permanently OFF	Pulsing	Permanent ON
Output 48	all relays inactive due to system error	one input function not available	Activation of the assigned safety outputs is permissible
LED run 1	Two-hand control not activated (LED run 2 ON) or all relays inactive due to system error	one input function not available (LED run 2 ON) or system error when LED Run 2 is OFF or flashing	Activation of the assigned safety outputs is permissible
Output 58	Activation of the assigned safety outputs is permissible or system error	Error exists no more, waiting for Start input	one input function not available
LED run 2	all relays inactive due to system error	all relays inactive due to system error	No system error

## Function Diagrams

**Note:** The times specified in a pulse diagram also apply to the same function in other applications.

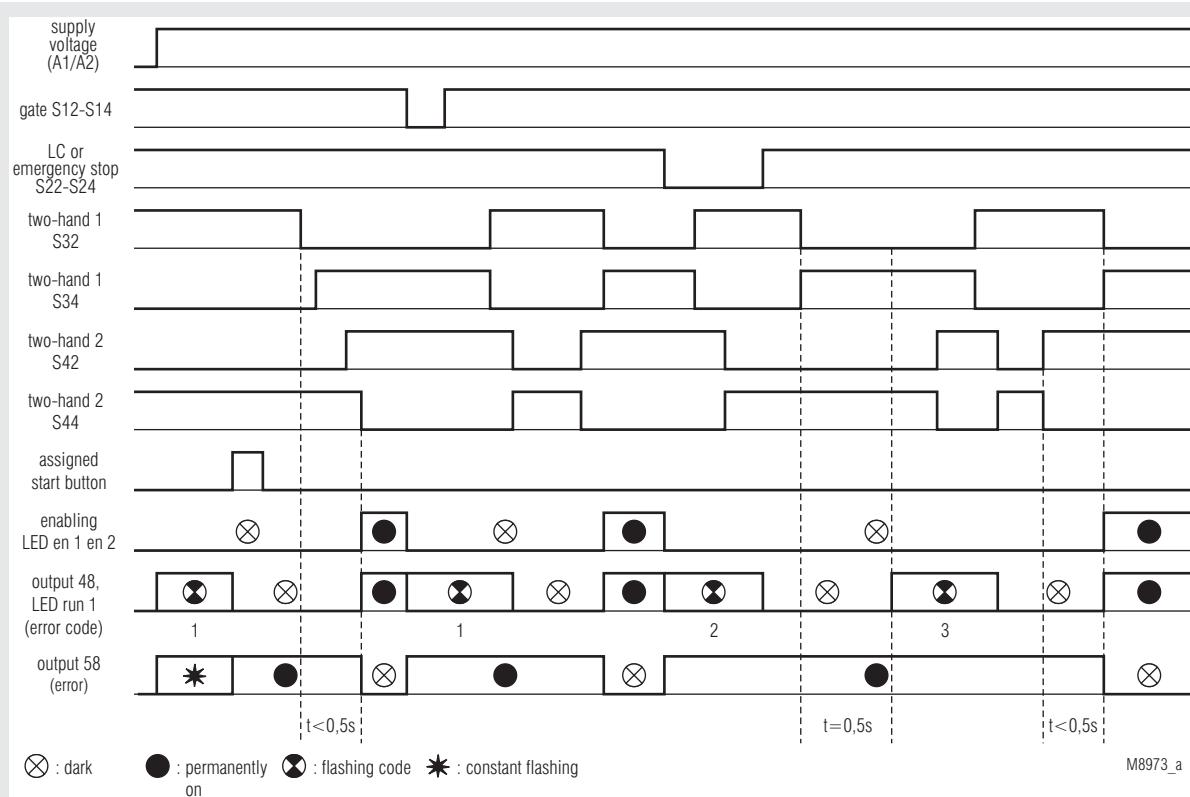

2 safety gates, 2 light curtains (Autostart)

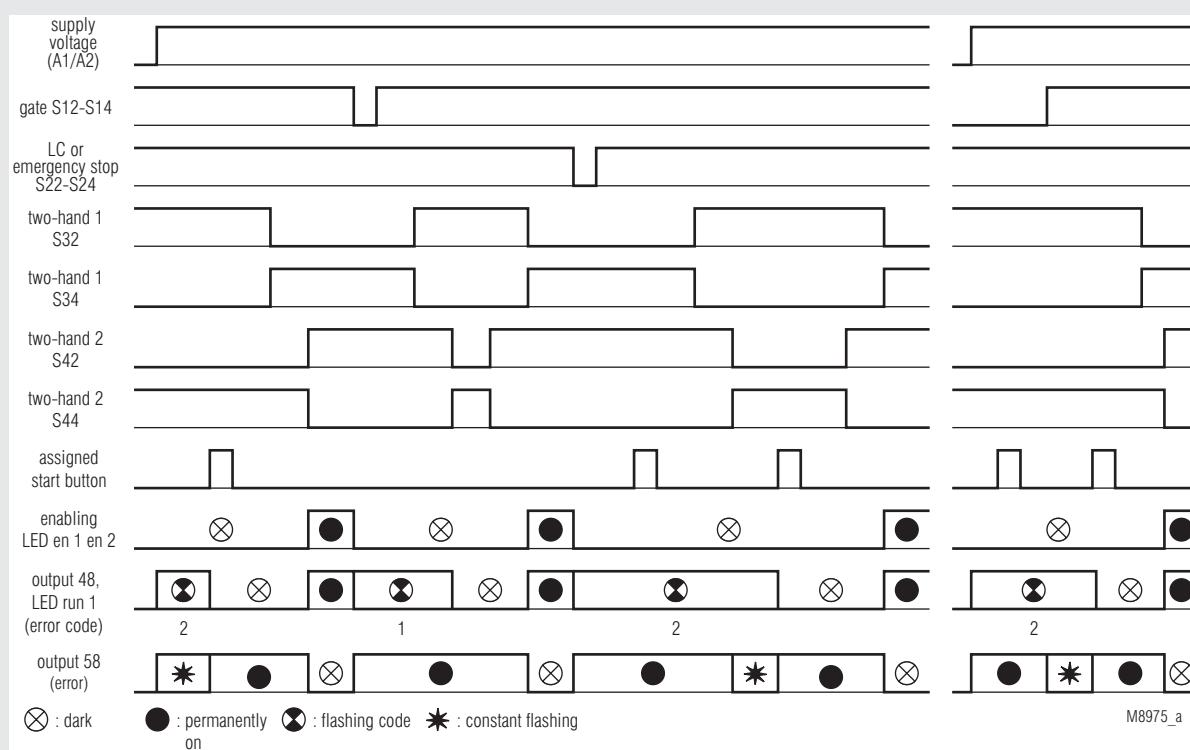

2 safety gates, 2 light curtains (manual start)

## Function Diagrams

**Note:** The times specified in a pulse diagram also apply to the same function in other applications.

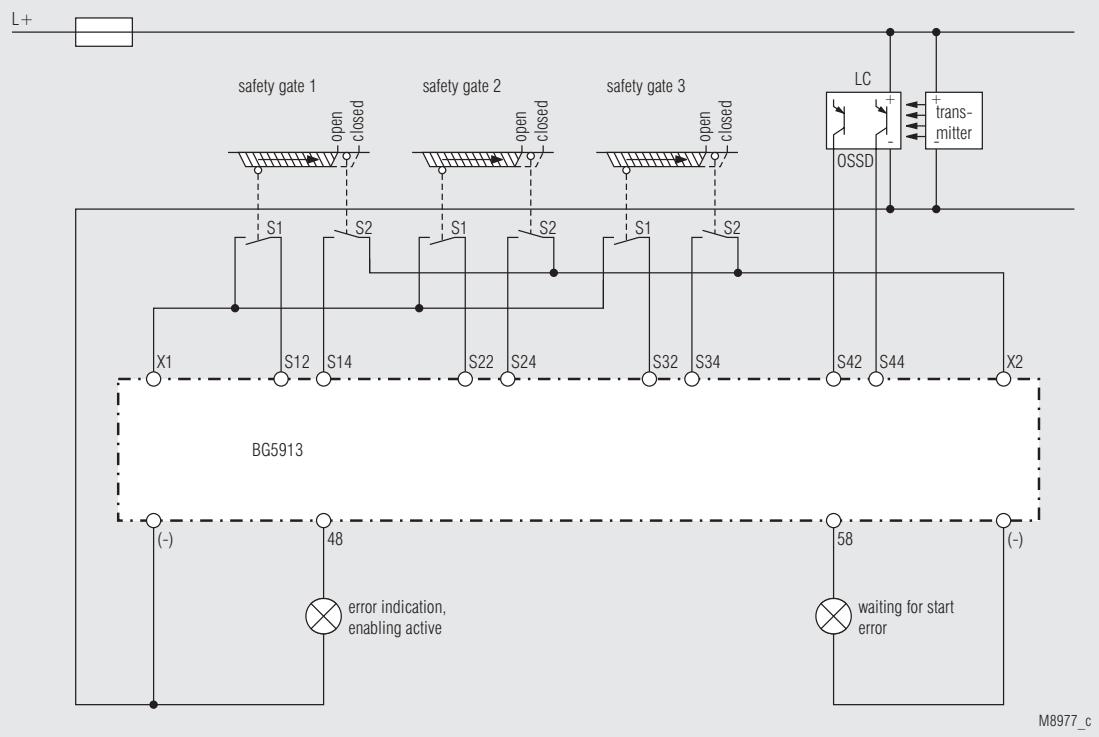

1 safety gate, 1 light curtain or Emergency stop (Autostart), 1 two-hand control (type IIIC)

## Multi-Function Safety System SAFEMASTER M

### Input Module

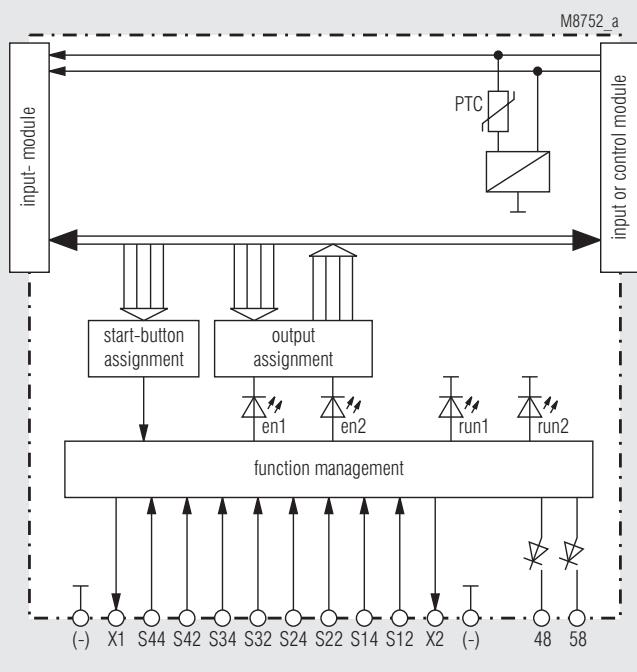

BG 5913.08/\_2

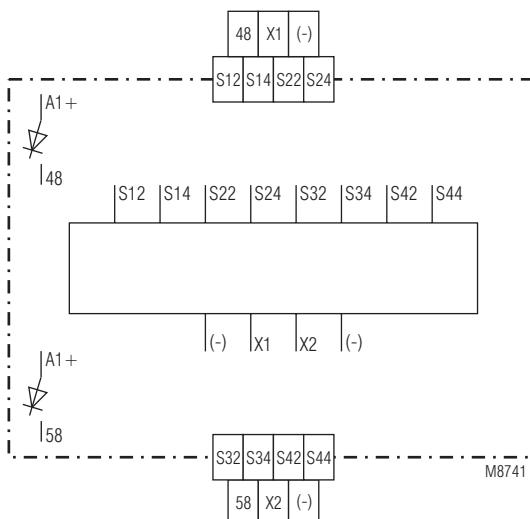

0247383

### Block Diagram

### Circuit Diagram

#### • According to

- Performance Level (PL) e and category 4 to EN ISO 13849-1: 2008
- SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
- Safety Integrity Level (SIL 3) to IEC/EN 61508

#### • Input module for combination of 4 of the following functions to be set via rotary switch:

- safety gate monitoring function (2 x 2 changeover contacts)
- Light curtain (LC type 4) with manual or automatic start
- Emergency stop (2-channel) with manual or automatic start
- Two-hand controls type IIIC acc. to DIN/EN 574

#### • Functions can be selected via rotary switches

#### • 8 inputs for safety sensors

#### • Broken wire and short circuit monitoring function with error indication

#### • 2 semiconductor outputs for status indication

#### • LEDs for status indication

• Width: 22.5 mm

### Approvals and Markings

### Applications

Realization of fail-safe control circuits for protection of people and machinery.

**Note:** This module is intended for applications in which mixed safety functions affect one common output.

Further input modules with other combinations of functions are provided (e.g. BG 5913.08/\_0, BG 5913.08/\_2, BG 5913.08/\_3, BG 5914.08/\_0, BH 5914.08/\_0, BG 5914.08/\_1, BG 5915/\_1 or BH 5915.08/\_1).

### General Information SAFEMASTER M

The maximum configuration of the SAFEMASTER M multi-function safety system is as follows:

- the control unit BH 5911
- up to 3 input modules BG/BH 5913, or BG/BH 5914, BG/BH 5915
- up to 3 output modules BG 5912
- 1 diagnostic module BG 5551 for CANopen, or
- 1 diagnostic module BG 5552 for Profibus-DP

The BH 5911 controls the whole system.

The input/output modules can be used to expand the control unit in a modular way into a multi-functional safety system.

To transmit status messages of the individual modules to a monitoring or control unit, one of the following diagnostic modules may be connected:

- BG 5551 for CANopen
- BH 5552 for Profibus-DP

### Indicators

Green LEDs: on, when all inputs are present and start button activated.

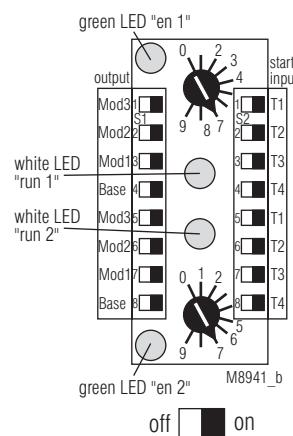

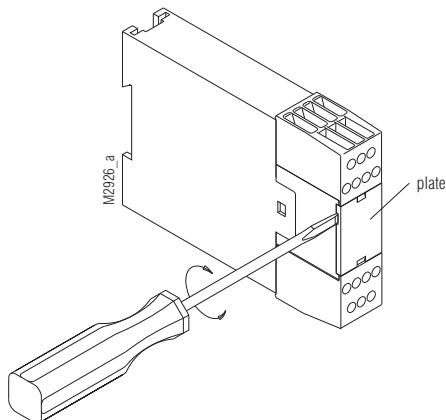

White LEDs Run1/  
Run 2 and outputs  
48 and 58:

indicate the current status of the module.

## Setting of the Module

The module is assigned to the start inputs and the safety outputs via the DIP switches.

The combinations of individual functions are set via the rotary switches. To prevent accidentally adjustments, these elements are covered by a front plate and are redundant.

### Note:

- Settings to the unit must be performed by skilled personnel while the unit is disconnected.
- Before the front cover is removed, antistatic precautions must be observed.

## Functional Principle of Combined Inputs

Each function activates an enabling signal in the module software. The control unit is permitted to enable the assigned safety outputs only after all 3 (for two-hands control) or 4 enablings have been given.

With the exception of two-hand control, each function works independently. The assigned safety outputs are enabled if the precondition for enabling has been met for all functions.

## Function of the Two-Hand Control

This function will only work when the other two functions have already permitted enabling. To provide for enabling, the two buttons must be pressed within 0.5 s. As soon as one of the other function reacts, the two buttons must turn inactive before the others can be enabled again. Only after that, the buttons can be activated once more from an inactivated state.

The unit must be connected as specified in the application examples. When the operating contacts are connected in parallel or in series, safe functioning of the unit is cancelled.

The two-hand buttons must be designed and arranged in such a way as to ensure that they cannot be disabled with easily, or pressed unintentionally.

The safety distance between the push buttons and the place of danger must be large enough to make sure that after releasing a button, the place of danger can only be reached after the dangerous movement has stopped.

The safety distance "S" is calculated according to the following formula:

$$S = V \times T + C, \text{ where}$$

- a) gripping velocity  $V = 1\,600 \text{ mm/s}$
- b) overtravel time  $T (\text{s})$
- c) and safety factor  $C = 250 \text{ mm}$ .

When any access into the danger area, with operating keys pressed, is safely prevented, e.g. by a protective cover for the keys, the safety factor C may be set to the value 0. Generally, the minimum safety distance must be 100 mm. In this respect, also see DIN/EN 574.

The two-hand control must be released when another function module which affects the same outputs does not permit enabling. The system may comprise only one function module with two-hand control.

## Safety Gate Function

The safety gate function always permits enabling if both contacts change from inactive to active state within 3 seconds. If the second contact reacts later, both changeover contacts must turn inactive before they can be enabled again.

When activating the system, press the start button to simulate the compulsory opening and re-closing of safety gates which have been kept closed since the system has started.

This simulation is possible only before enabling has been permitted for the first time, and as long as both safety gate contacts remain closed as well. As soon as a contact opens, simulation of the safety gate function is no longer possible.

## E-Stop or Light Curtain (LC) Function

In the Emergency stop or LC functions, both signals have to change from inactive state into active state within 250 ms. If the second signal reacts later, both changeover contacts must turn inactive before they can be enabled again.

With manual start, all safety inputs must be active before the start button can be pressed to trigger enabling. To start the system, do not keep the start button pressed for more than 3 seconds. A module may also be assigned several start buttons.

**Note:** Connect only self-testing light curtains of the type 4 acc. to EN 61496 to the module. Short-circuit monitoring of the inputs for the LC must be done in the LC.

## Indication of System Errors:

These errors are indicated by flashing codes of the white LEDs Run 1 and/or Run 2. The green LEDs and all outputs turn inactive. The system will only restart after the supply voltage has been switched off and on again.

### Error codes\*

- 0) (both white LEDs are off):  
Another input module indicates a system error.
- 1) To 4): not used
- 5) Incorrect setting of function:
  - The rotary switches for channel 1 and 2 have different or incorrect positions
  - The setting of the 4 upper Dip-switches (channel 1) are not identically to the 4 lower Dip-switches (channel 2)
- 6) LED Run 1 flashes: Undervoltage  
LED Run 2 flashes: Overvoltage
- 7), 8) Not used
- 9) Connection error between the input modules  
No terminating connector available.
  - Control or input module defective
- 10), 11), 12), 13) a. 14) Internal errors

\* number of short flashing impulses, followed by a longer space

## Function Error Indication

Function errors are indicated by the white LED Run 1 and by output 48; the white LED Run 2 remains on. Output 58 is ON as long as the error is pending; it flashes regularly, while waiting for the assigned start signal.

### Error codes\*

- 1) Normal interruption of function (e.g. Emergency stop)
- 2) Time error: (e.g. the second two-hand button is not pressed)
- 3) With gate monitoring: simulation input error (kept pressed for too long)
- 4) Error at start input
- 5) Input error (short-circuit, interruption)
- 6) Error in the control unit (input or output error detected in the control unit)

\* number of short flashing impulses, followed by a longer space

### Special with two-hand control:

When both two-hand buttons of the module are inactive while all other functions are active and enabled either by autostart or via the start button, output 48 and the white LED Run 1 are permanently OFF, and output 58 permanently ON.

### Special behaviour on e-stop (function setting 2 or 3):

Initial state: all e-stop buttons are not activated and the start button has been pressed correctly on manual start. An other module gives no enabling signal independent of the assigned output module. Output 48 and the white run LED 1 are off and output 58 is continuously on.

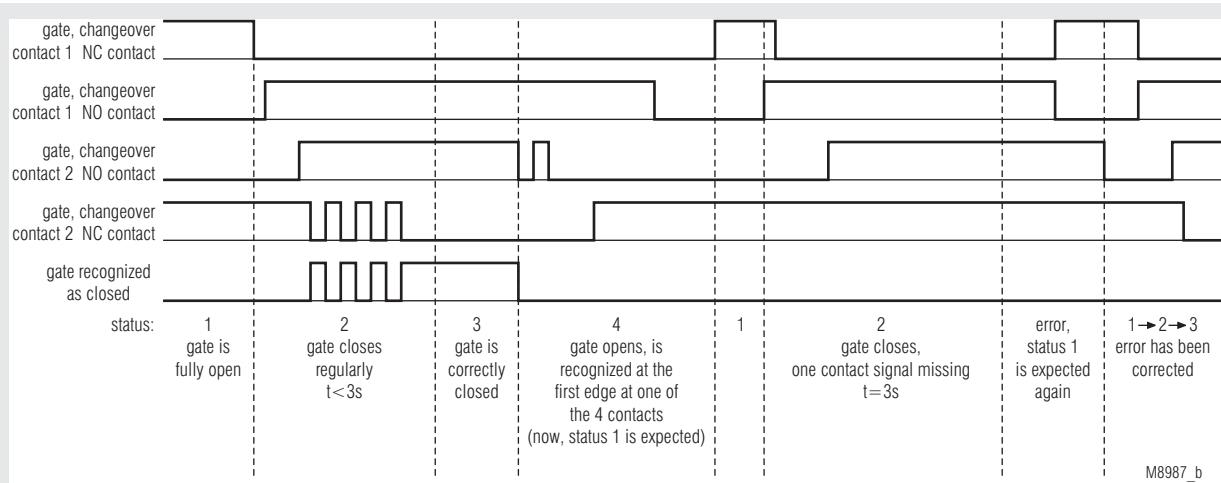

In this state the module will give the enabling signal automatically as soon as all other modules give their enabling signals together.

## Indicators

	Permanently OFF	Pulsing	Permanent ON
Output 48	all relays inactive due to system error	one input function not available	Activation of the assigned safety outputs is permissible
LED run 1	Two-hand control not activated (LED run 2 ON) or all relays inactive due to system error	one input function not available (LED run 2 ON) or system error when LED Run 2 is OFF or flashing	Activation of the assigned safety outputs is permissible
Output 58	Activation of the assigned safety outputs is permissible or system error	Error exists no more, waiting for Start input	one input function not available
LED run 2	all relays inactive due to system error	all relays inactive due to system error	No system error

## Multi-Function Safety System SAFEMASTER M

### Input Module

BG 5913.08/\_3

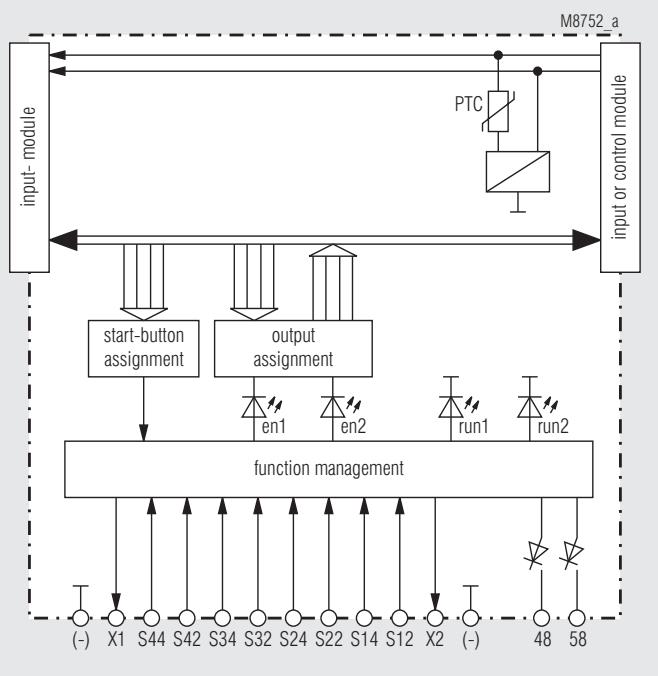

0249378

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1: 2008
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL 3) to IEC/EN 61508
- Input module mit einer per Stufenschalter einstellbarer Combination of the following 3 functions:
  - Light curtains (LC) type 4 with manual or automatic start
  - E-stop 2-channel and manual or automatic start
  - Two-hand function type IIIC according to DIN/EN 574
- The functions are selected via rotary switch
- 8 safety inputs
- 2 semiconductor outputs for status indication
- Broken wire and short circuit monitoring function with error indication
- LEDs for status indication
- Width: 22.5 mm

### Block Diagram

### Approvals and Markings

### Applications

Realization of fail-safe control circuits for protection of people and machinery.

**Note:** This module is intended for applications in which mixed safety functions affect one common output.

Further input modules with other combinations of functions are provided (e.g. BG 5913.08/\_0\_ \_ \_ , BG 5913.08/\_2\_ \_ \_ , BG 5913.08/\_3\_ \_ \_ , BG 5914.08/\_0\_ \_ \_ , BH 5914.08/\_0\_ \_ \_ , BG 5914.08/\_1\_ \_ \_ , BG 5915/\_1\_ \_ \_ or BH 5915.08/\_1\_ \_ \_ ).

### General Information SAFEMASTER M

The maximum configuration of the SAFEMASTER M multi-function safety system is as follows:

- the control unit BH 5911
- up to 3 input modules BG/BH 5913, or BG/BH 5914, BG/BH 5915
- up to 3 output modules BG 5912
- 1 diagnostic module BG 5551 for CANopen, or
- 1 diagnostic module BG 5552 for Profibus-DP

The BH 5911 controls the whole system.

The input/output modules can be used to expand the control unit in a modular way into a multi-functional safety system.

To transmit status messages of the individual modules to a monitoring or control unit, one of the following diagnostic modules may be connected:

- BG 5551 for CANopen
- BH 5552 for Profibus-DP

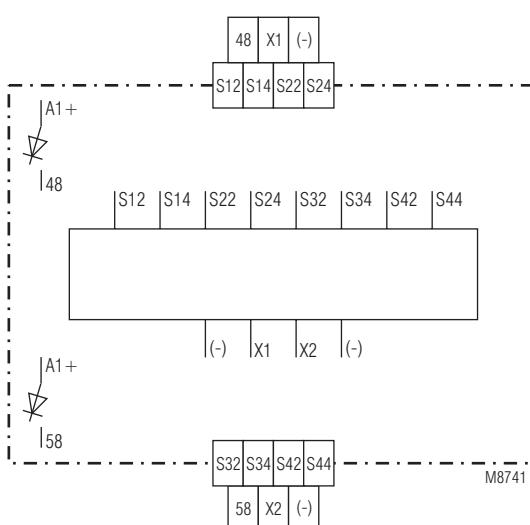

### Indicators

Green LEDs: on, when all inputs are present and start button activated.

White LEDs Run1/  
Run 2 and outputs  
48 and 58:

indicate the current status of the module.

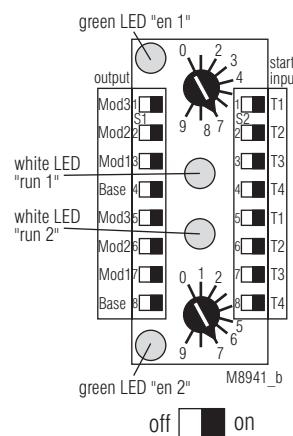

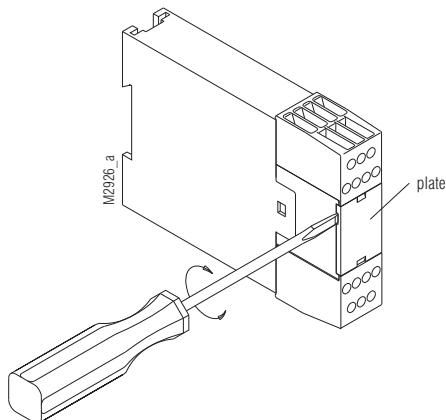

### Circuit Diagram

## Setting of the Module

The module is assigned to the start inputs and the safety outputs via the DIP switches.

The combinations of individual functions are set via the rotary switches. To prevent accidentally adjustments, these elements are covered by a front plate and are redundant.

### Note:

- Settings to the unit must be performed by skilled personnel while the unit is disconnected.
- Before the front cover is removed, antistatic precautions must be observed.

## Setting of the Modules

Sw.	Function at Terminals				Start behavior of the LC / E-Stop
	S12-S14	S22-S24	S32-S34	S22-S24

7	LC	LC	Two-hand IIIC		Manual Start
8	E-stop	LC	Two-hand IIIC		Manual Start
9	E-stop	LC	Two-hand IIIC		Autostart

## Functional Principle of Combined Inputs

Each function activates an enabling signal in the module software. The control unit is permitted to enable the assigned safety outputs only after all 3 (for two-hands control) or 4 enablings have been given.

With the exception of two-hand control, each function works independently. The assigned safety outputs are enabled if the precondition for enabling has been met for all functions.

## Function of the Two-Hand Control

This function will only work when the other two functions have already permitted enabling. To provide for enabling, the two buttons must be pressed within 0.5 s. As soon as one of the other function reacts, the two buttons must turn inactive before the others can be enabled again. Only after that, the buttons can be activated once more from an inactivated state.

The unit must be connected as specified in the application examples. When the operating contacts are connected in parallel or in series, safe functioning of the unit is cancelled.

The two-hand buttons must be designed and arranged in such a way as to ensure that they cannot be disabled with easily, or pressed unintentionally.

The safety distance between the push buttons and the place of danger must be large enough to make sure that after releasing a button, the place of danger can only be reached after the dangerous movement has stopped.

The safety distance "S" is calculated according to the following formula:

$$S = V \times T + C, \text{ where}$$

- a) gripping velocity  $V = 1\,600 \text{ mm/s}$
- b) overtravel time  $T (\text{s})$
- c) and safety factor  $C = 250 \text{ mm}$ .

When any access into the danger area, with operating keys pressed, is safely prevented, e.g. by a protective cover for the keys, the safety factor C may be set to the value 0. Generally, the minimum safety distance must be 100 mm. In this respect, also see DIN/EN 574.

The two-hand control must be released when another function module which affects the same outputs does not permit enabling.

The system may comprise only one function module with two-hand control.

## E-Stop or Light Curtain (LC) Function

In the Emergency stop or LC functions, both signals have to change from inactive state into active state within 250 ms. If the second signal reacts later, both changeover contacts must turn inactive before they can be enabled again.

With manual start, all safety inputs must be active before the start button can be pressed to trigger enabling. To start the system, do not keep the start button pressed for more than 3 seconds. A module may also be assigned several start buttons.

**Note:** Connect only self-testing light curtains of the type 4 acc. to EN 61496 to the module. Short-circuit monitoring of the inputs for the LC must be done in the LC.

## Indication of System Errors:

These errors are indicated by flashing codes of the white LEDs Run 1 and/or Run 2. The green LEDs and all outputs turn inactive. The system will only restart after the supply voltage has been switched off and on again.

### Error codes\*

- 0) (both white LEDs are off):  
Another input module indicates a system error.
- 1) To 4): not used
- 5) Incorrect setting of function:
  - The rotary switches for channel 1 and 2 has different or incorrect positions
  - The setting of the 4 upper Dip-switches (channel 1) are not identically to the 4 lower Dip-switches (channel 2)
- 6) LED Run 1 flashes: Undervoltage  
LED Run 2 flashes: Overvoltage
- 7), 8) Not used
- 9) Connection error between the input modules  
No terminating connector available.  
- Control or input module defective
- 10), 11), 12), 13) a. 14) Internal errors

\* number of short flashing impulses, followed by a longer space

## Function Error Indication

Function errors are indicated by the white LED Run 1 and by output 48; the white LED Run 2 remains on. Output 58 is ON as long as the error is pending; it flashes regularly, while waiting for the assigned start signal.

### Error codes\*

- 1) Normal interruption of function (e.g. Emergency stop)
- 2) Time error: (e.g. the second two-hand button is not pressed)
- 3) With gate monitoring: simulation input error (kept pressed for too long)
- 4) Error at start input
- 5) Input error (short-circuit, interruption)
- 6) Error in the control unit (input or output error detected in the control unit)

\* number of short flashing impulses, followed by a longer space

### Special with two-hand control:

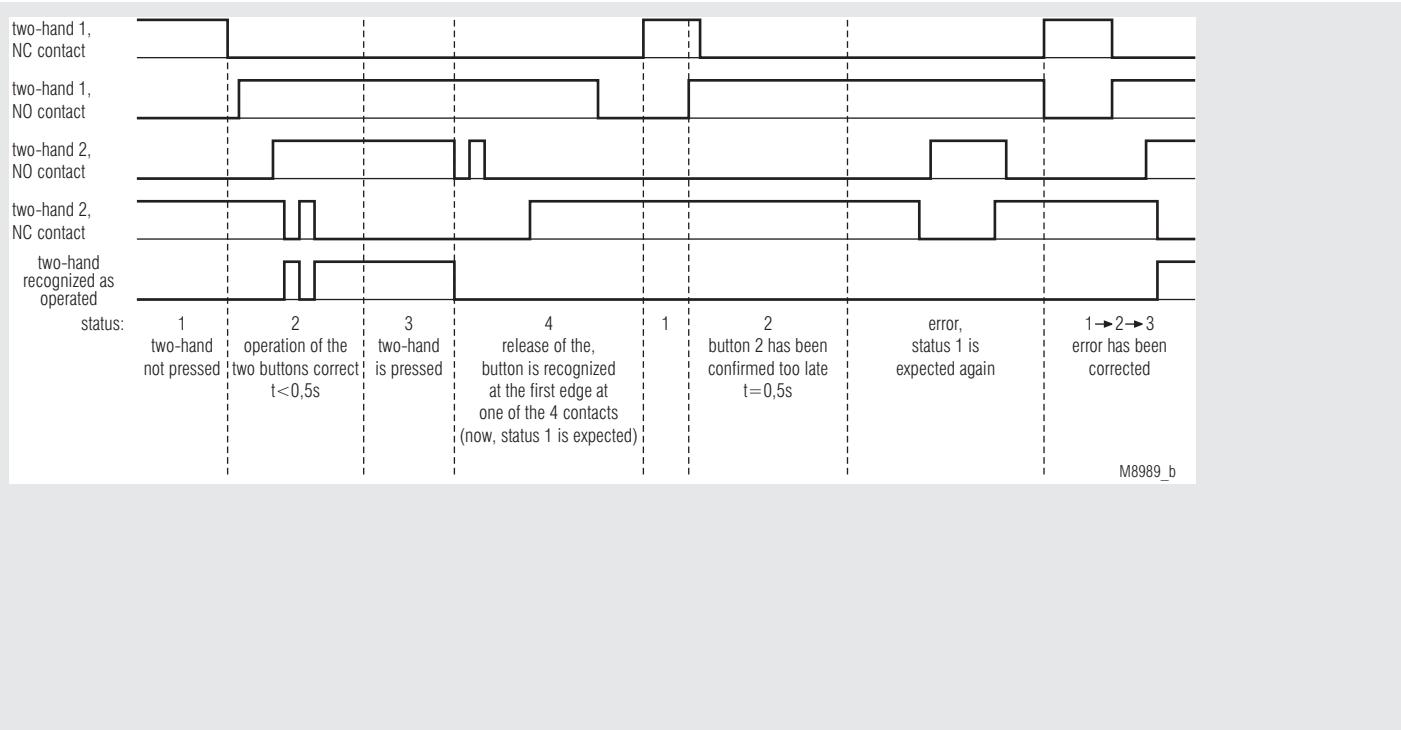

When both two-hand buttons of the module are inactive while all other functions are active and enabled either by autostart or via the start button, output 48 and the white LED Run 1 are permanently OFF, and output 58 permanently ON.

## Indicators

	Permanently OFF	Pulsing	Permanent ON
Output 48	all relays inactive due to system error	one input function not available	Activation of the assigned safety outputs is permissible
LED run 1	Two-hand control not activated (LED run 2 ON) or all relays inactive due to system error	one input function not available (LED run 2 ON) or system error when LED Run 2 is OFF or flashing	Activation of the assigned safety outputs is permissible
Output 58	Activation of the assigned safety outputs is permissible or system error	Error exists no more, waiting for Start input	one input function not available
LED run 2	all relays inactive due to system error	all relays inactive due to system error	No system error

## Function Diagrams

**Note:** The times specified in a pulse diagram also apply to the same function in other applications.

## Multi-Function Safety System SAFEMASTER M Input Module BG 5914.08/\_0\_\_\_\_\_, BH 5914.08/\_0\_\_\_\_\_-

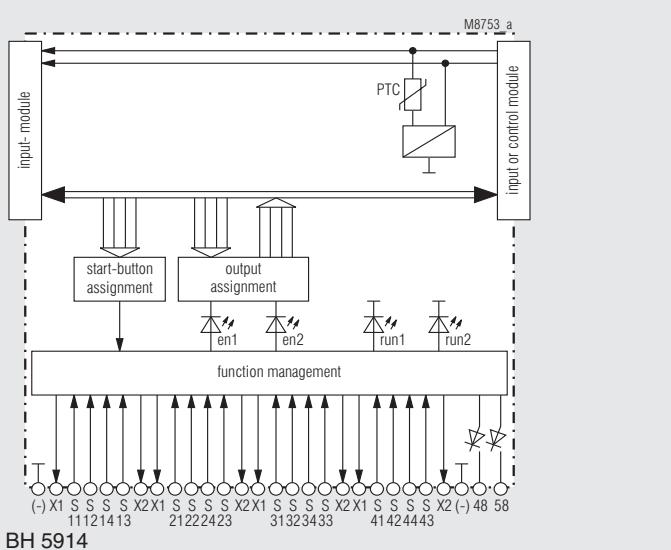

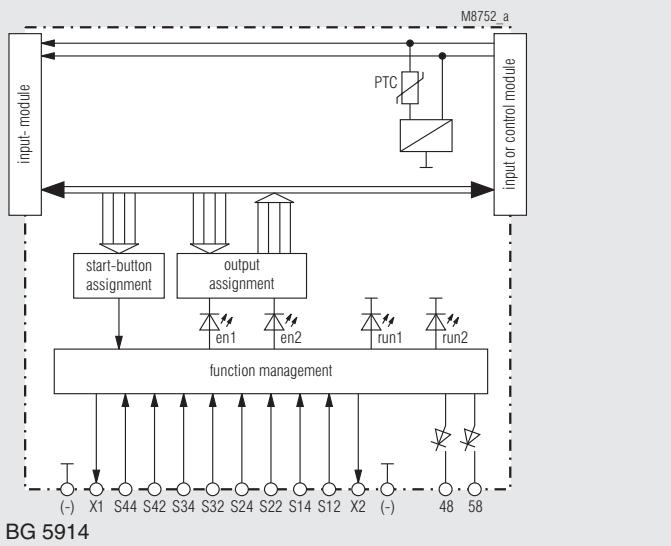

**DOLD** 

0247389

- According to
  - Performance Level (PL) d and category 2 to EN ISO 13849-1: 2008
  - SIL Claimed Level (SIL CL) 2 to IEC/EN 62061
  - Safety Integrity Level (SIL 2) to IEC/EN 61508
- Input module for realization of:
  - 8 E-STOP, single-channel, autostart
  - 6 E-STOP, single-channel, + 1 E-STOP, 2-channel, autostart
  - 5 E-STOP, single-channel, + 1 -STOP, 2-channel + 1 signal input, autostart
  - 8 E-STOP, single-channel, manual start
  - 6 E-STOP, single-channel, + 1 E-STOP, 2-channel, manual start
  - 5 E-STOP, single-channel, + 1 E-STOP, 2-channel + 1 signal input, manual start
- As an alternative to the 2-channel E-STOP, a light curtain (LC type 4) according to EN 61496-1 can be connected.
- Broken wire and short circuit monitoring function with error indication
- 2 semiconductor outputs per function module for status indication
- LEDs for status indication
- Width: 22.5 mm (BG 5914) or 45 mm (BH 5914)

### Block Diagrams

BH 5914

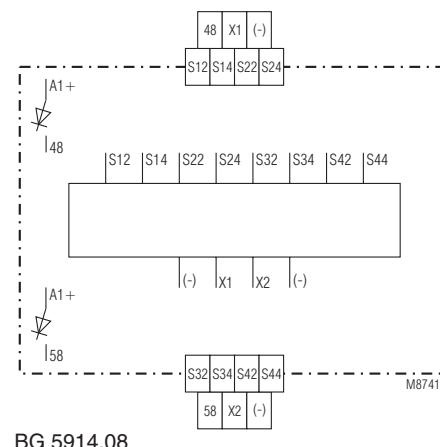

### Approvals and Markings

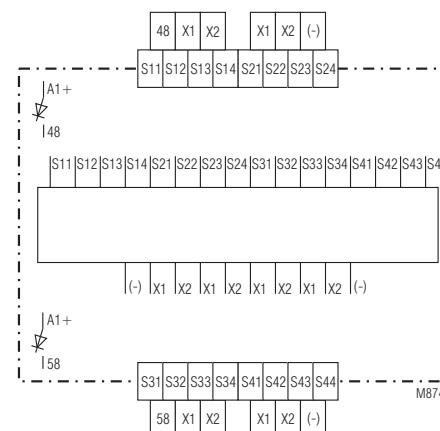

### Applications

Realization of fail-safe control circuits for protection of people and machinery. The modules BG 5914 and BH 5914 have been developed for applications in which numerous one-channel Emergency stop contacts have to be monitored.

### Circuit Diagrams

BG 5914.08

BH 5914.08

## General Information SAFEMASTER M

The maximum configuration of the SAFEMASTER M multi-function safety system is as follows:

- the control unit BH 5911
- up to 3 input modules BG/BH 5913, or BG/BH 5914, BG/BH 5915
- up to 3 output modules BG 5912
- 1 diagnostic module BG 5551 for CANopen, or
- 1 diagnostic module BG 5552 for Profibus-DP

The BH 5911 controls the whole system.

The input/output modules can be used to expand the control unit in a modular way into a multi-functional safety system.

To transmit status messages of the individual modules to a monitoring or control unit, one of the following diagnostic modules may be connected:

- BG 5551 for CANopen
- BH 5552 for Profibus-DP

## Notes

In respect of function and settings, the modules BG 5914 and BH 5914 are completely identical.

- The modules BG 5914 have 8 inputs with one common ground. This is the ground of the overall system. They are suitable for all applications in which volt free contacts are used, or where there is a common ground (e.g. 2-channel light curtains). They need only 8 terminals and thus only have an overall width of 22.5 mm.
- The modules BH 5914 have 8 completely DC-decoupled inputs. In the settings for a 2-channel Emergency stop, several systems can be operated from the same E-stop button.
- The modules BH 5914 **must** be used as soon as one Emergency stop contact is executed on several modules. Here, short-circuit monitoring is effected by a certain type of wiring according to the application examples.

## Indication

Green LEDs: on, when all inputs are present and start button activated.

White LEDs Run 1/  
Run 2 and outputs  
48 and 58: indicate the current status of the module.

## Signal Input

This input does not have a safety function. It is used only to signal the status of a switch (NO contact) and does not affect the safety outputs assigned to the module (e.g. when the machine is set to service mode).

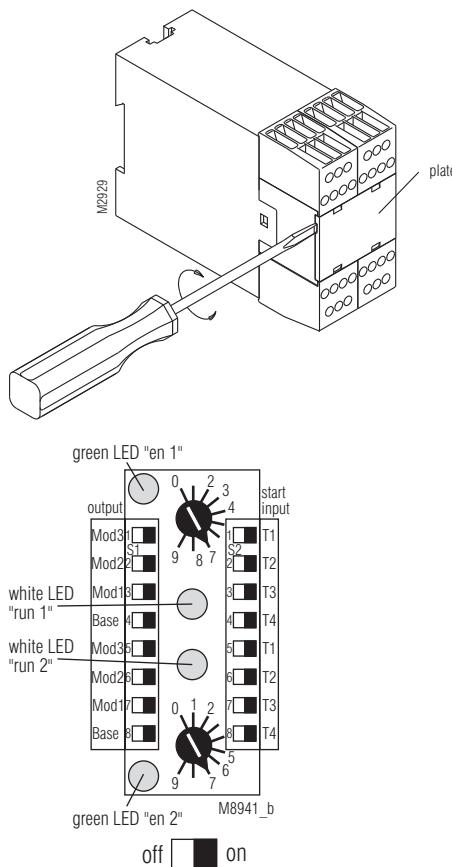

- If voltage is applied to the input, the white LED Run 2 is ON. The semiconductor output 58 is OFF as long as no Emergency stop is active.
- If no voltage is applied to the input, the white LED Run 2 will go out, and the semiconductor output 58 will become conductive.

## Setting of the Module

In respect of function and settings, the modules BG 5914 and BH 5914 are completely identical.

The modules are assigned to the start buttons and the safety outputs via the DIP switches.

The function is set via the rotary switches. To prevent accidentally adjustments, these elements are covered by a front plate and are redundant.

### Note:

- Settings to the unit must be performed by skilled personnel while the unit is disconnected.
- Before the front cover is removed, antistatic precautions must be observed.

Sw.	Function
0	8 Emergency stop single-channel, autostart
1	6 emergency stop, single-channel, + 1 emergency stop, 2-channel with short circuit detection, autostart
2	6 emergency stop, single-channel, + 1 emergency stop, 2-channel without short circuit detection or 1 LC type 4, autostart
3	5 emergency stop, single-channel, + 1 emergency stop, 2-channel without short circuit detection or 1 LC type 4 + 1 signal input, autostart
4	8 Emergency stop single-channel, manual start
5	6 emergency stop, single-channel, + 1 emergency stop, 2-channel with short circuit detection, autostart
6	6 emergency stop, single-channel, + 1 emergency stop, 2-channel without short circuit detection or 1 LC type 4, manual start
7	5 emergency stop, single-channel, + 1 emergency stop, 2-channel without short circuit detection or 1 LC type 4 + 1 signal input, manual start
8, 9	8, 9 not assigned (error 5)

## Setting of the Module

### Note:

This module is intended for applications in which numerous one-channel Emergency off contacts are to be monitored.

The settings 2, 3, 6, and 7 are required for example when several modules are connected to a common Emergency stop sensor. Short-circuit recognition can be realized externally by means of proper wiring.

With a LC type 4 (according to IEC/EN 61496-1), short-circuit monitoring takes place in the light curtain itself.

### Single-Channel Emergency-Stop

With single-channel safety inputs, safety function can only be realized when voltfree contacts are used (see wiring examples).

With static, voltage signals, it is imperative to use 2-channel signal sensors.

### Automatic Start

Automatic start is performed only when supply voltage is switched on, or when enabling has been cancelled by pressing Emergency stop.

All other errors nevertheless require confirmation by a start key.

### Manual Start

To start the system, do not keep the start key pressed for more than 3 seconds. A module may also be assigned several start keys.

### Indication of System Errors:

These errors are indicated by flashing codes of the white LEDs Run 1 and/or Run 2. The green LEDs and all outputs turn inactive. The system will only restart after the supply voltage has been switched off and on again.

### Error codes\*

- 0) (both white LEDs are off):  
Another input module indicates a system error.
- 1) To 4): not used
- 5) Incorrect setting of function:
  - The rotary switches for channel 1 and 2 have different or incorrect positions
  - The setting of the 4 upper Dip-switches (channel 1) are not identically to the 4 lower Dip-switches (channel 2)
- 6) LED Run 1 flashes: Undervoltage  
LED Run 2 flashes: Overvoltage
- 7), 8) Not used
- 9) Connection error between the input modules  
No terminating connector available.
  - Control or input module defective
- 10), 11), 12), 13) a. 14) Internal errors

\* number of short flashing impulses, followed by a longer space

## Indicators

	Permanently OFF	Pulsing	Permanent ON
Output 48	all relays inactive due to system error	one input function not available	Activation of the assigned safety outputs is permissible
LED Run 1	all relays inactive due to system error	one input function not available (LED run 2 ON) or system error when LED Run 2 is OFF or flashing	Activation of the assigned safety outputs is permissible
Output 58	Activation of the assigned safety outputs is permissible or system error	Wait for start	one input function not available or K1 and K2 active and indicator contact inactive
LED Run 2	all relays inactive due to system error or K1 and K2 active and indicator contact inactive	all relays inactive due to system error	No system error

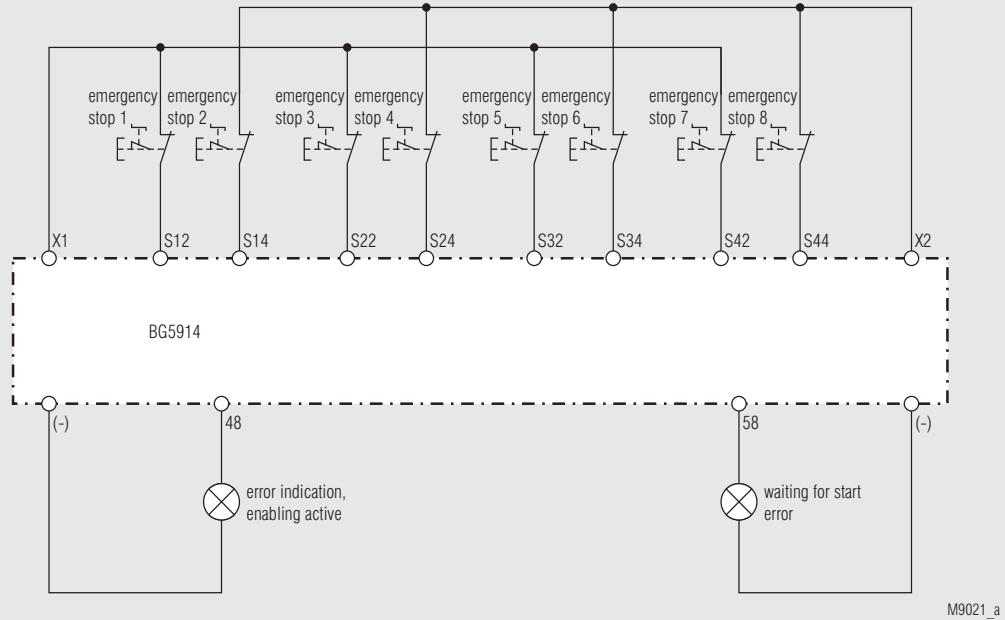

### Function Error Indication

Function errors are indicated by the white LED Run 1 and by output 48; the white LED Run 2 remains on. Output 58 remains on as long as the error is pending; it flashes regularly as soon as enabling via the assigned start button is possible again:

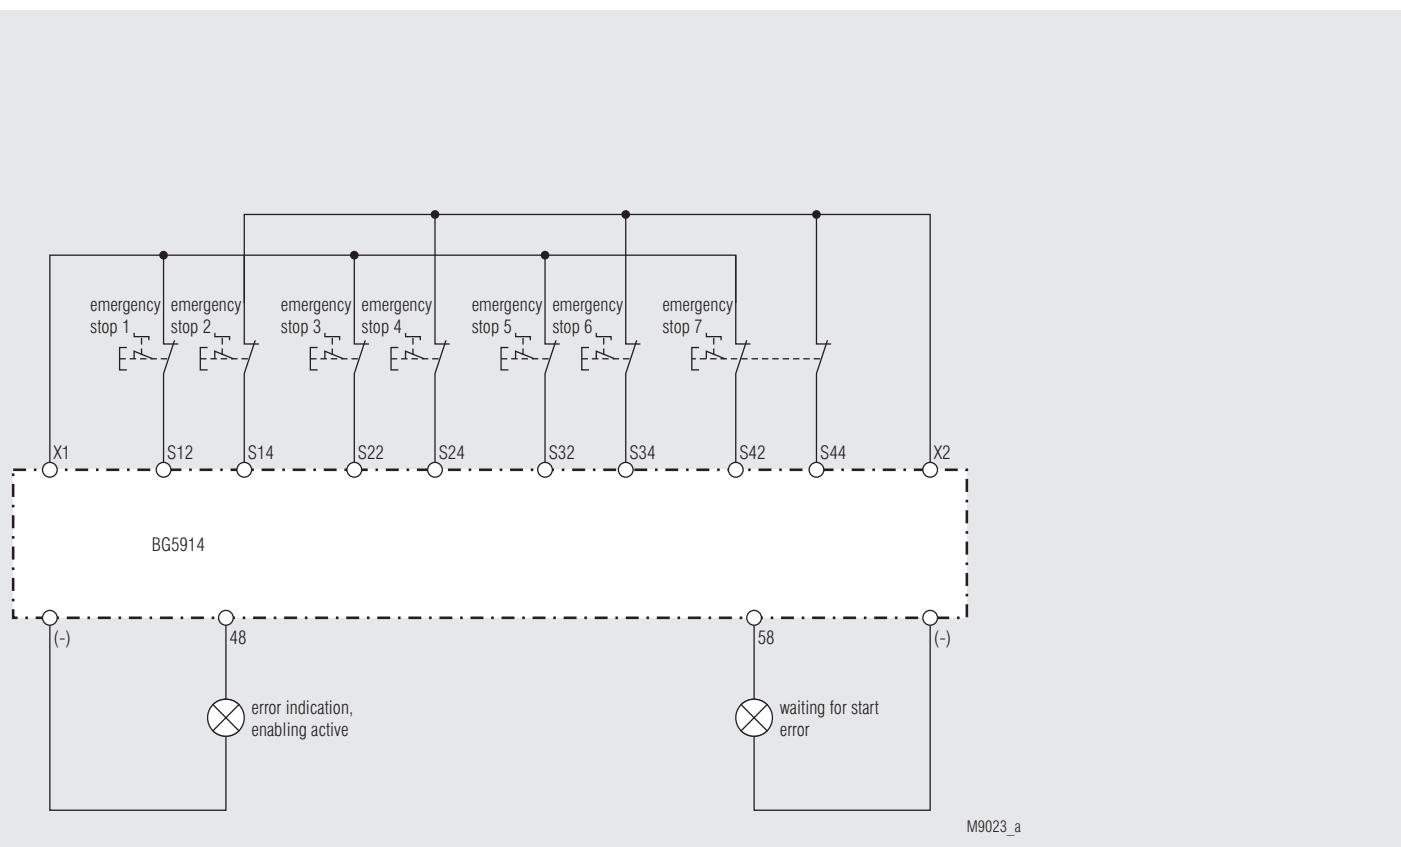

### Error codes\*

- 1) Emergency stop
- 2) Time error: Start button has been kept pressed for more than 3 seconds
- 3) Time error: The 2 signals of the 2-channel Emergency stop fail to correspond for too long (250 ms)
- 4) Error on start button (kept permanently pressed)
- 5) Input error (short-circuit, interruption)
- 6) Error in the control unit (input or output error recognized in the control unit)

\* number of short flashing impulses, followed by a longer space

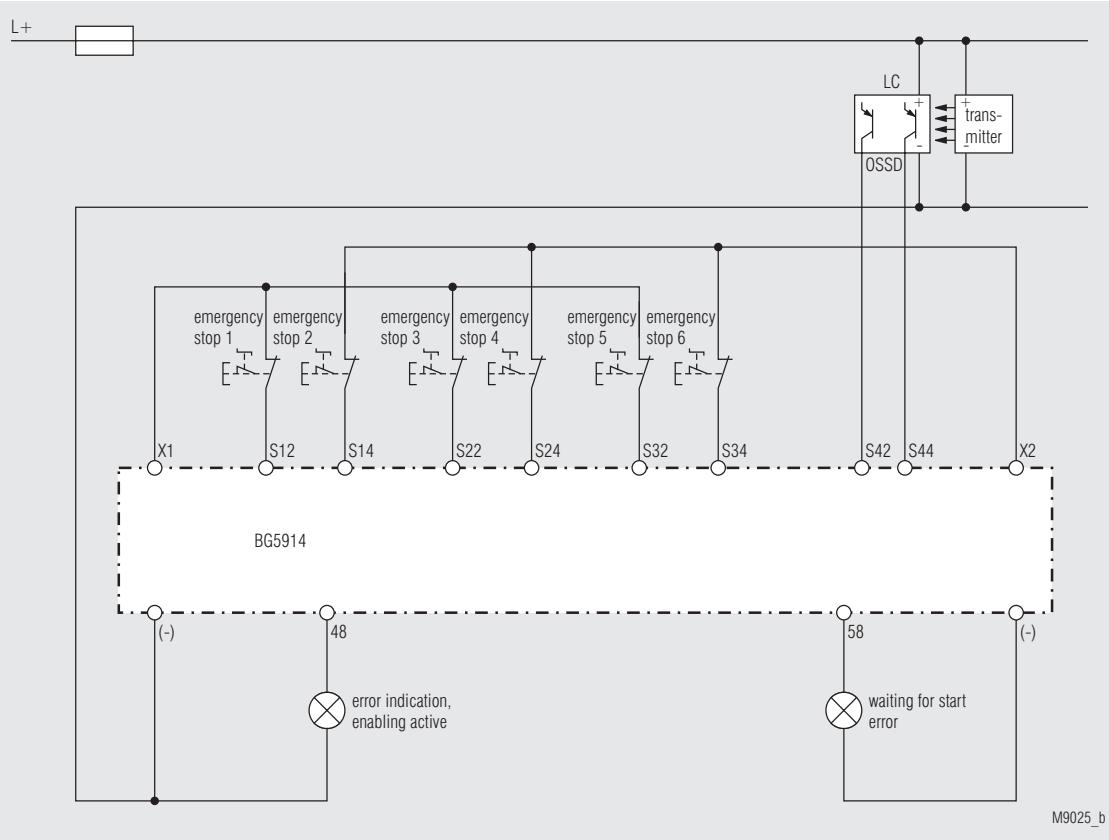

BG 5914, 8 Emergency stop, single-channel, voltfree contacts; functions: 0 or 4

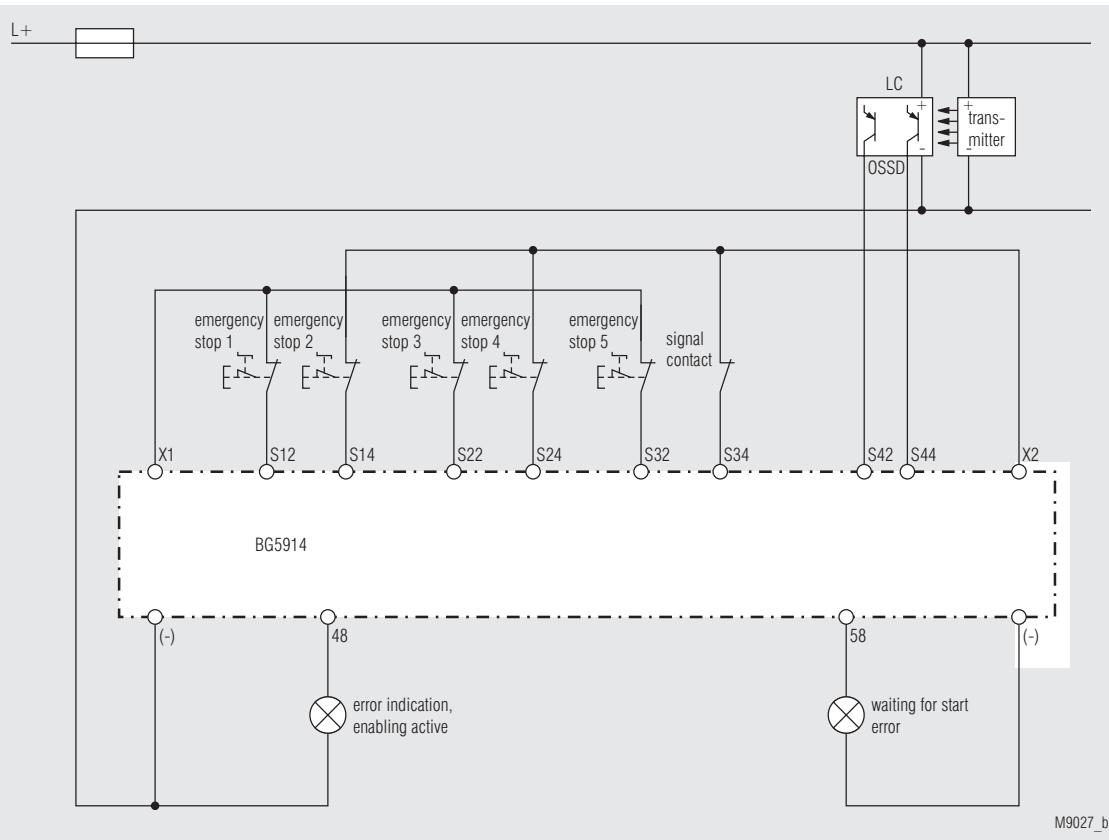

BG 5914, 6 Emergency stop single-channel, + 1 Emergency stop, 2-channel with short-circuit detection; functions: 1 or 5

## Application Examples

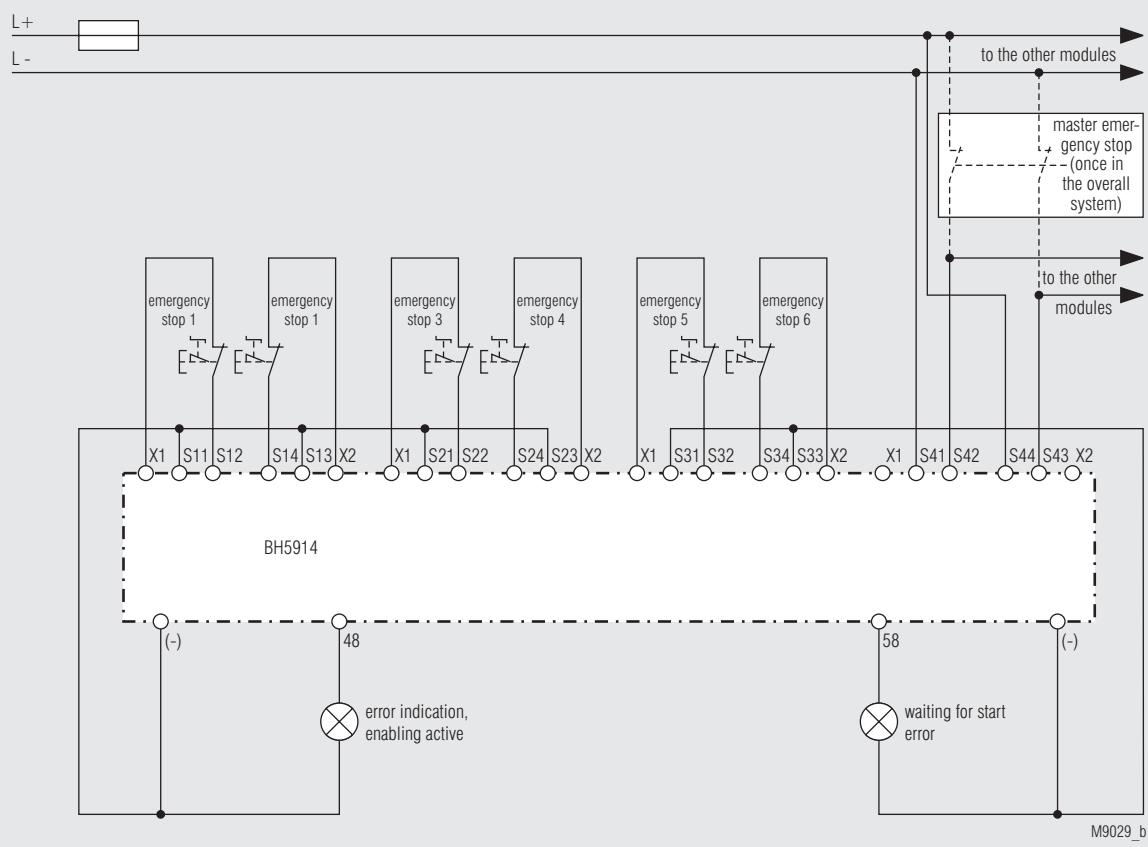

BG 5914, 6 Emergency stop single-channel + 1 light curtain type 4; functions 2 or 6

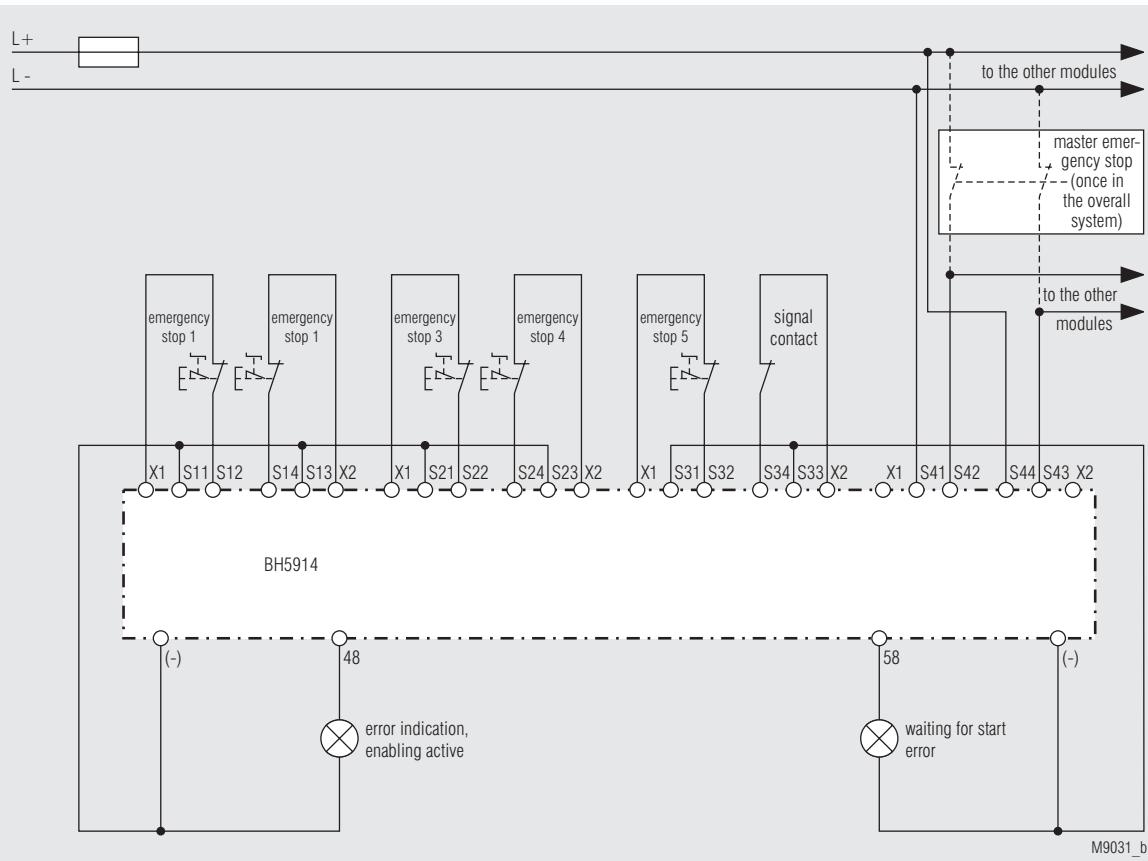

BG 5914, 5 Emergency stop single-channel + 1 light curtain type 4 + 1 signal contact;  
functions 3 or 7

## Application Examples

BH 5914, 6 Emergency stop single-channel + 1 Master Emergency stop 2-channel with short-circuit detection by means of wiring; functions: 2 or 6

BH 5914, 5 Emergency stop single-channel + 1 Master Emergency stop 2-channel with short-circuit detection by means of wiring + 1 signal contact; functions 3 or 7

- Width: 22.5 mm (BG 5915) or 45 mm (BH 5915)

### Approvals and Markings

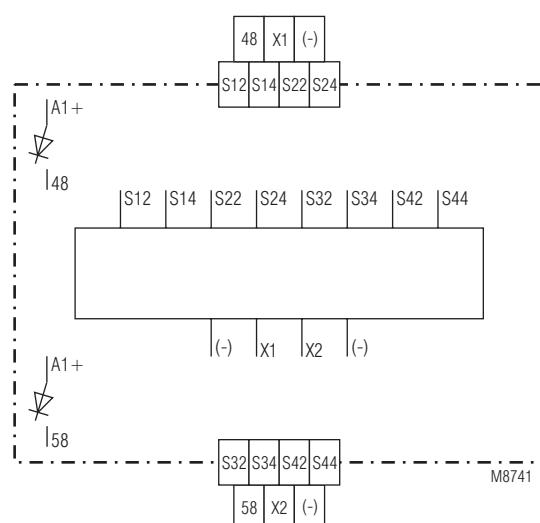

### Applications

Realization of fail-safe control circuits for protection of people and machinery.

**Note:** This module is intended for applications in which mixed safety functions affect one common output.

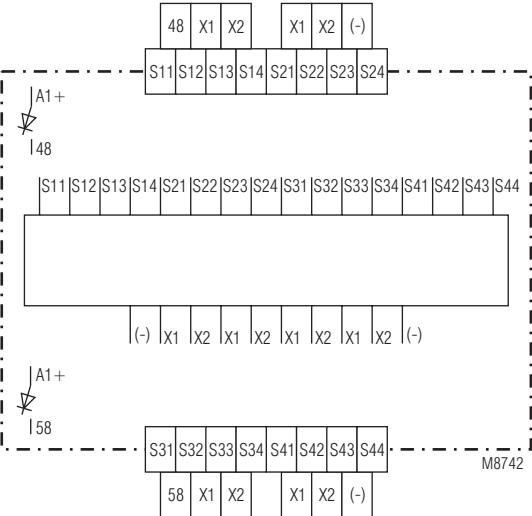

Further input modules with other combinations of functions are provided (e.g. BG 5913.08/\_0\_\_\_\_\_, BH 5913.08/\_0\_\_\_\_\_, BG 5913.08/\_1\_\_\_\_\_, BG 5913.08/\_2\_\_\_\_\_, BG 5913.08/\_3\_\_\_\_\_, BG 5914.08/\_0\_\_\_\_\_, BH 5914.08/\_0\_\_\_\_\_, oder BG 5914.08/\_1\_\_\_\_\_).

### Circuit Diagram

BG 5915

## Circuit Diagram

BH 5915

## **General Information SAFEMASTER M**

The maximum configuration of the SAFEMASTER M multi-function safety system is as follows:

- the control unit BH 5911
  - up to 3 input modules BG/BH 5913, or BG/BH 5914, BG/BH 5915
  - up to 3 output modules BG 5912
  - 1 diagnostic module BG 5551 for CANopen, or
  - 1 diagnostic module BG 5552 for Profibus-DP

The BH 5911 controls the whole system.

The input/output modules can be used to expand the control unit in a modular way into a multi-functional safety system.

To transmit status messages of the individual modules to a monitoring or control unit, one of the following diagnostic modules may be connected:

- BG 5551 for CANopen
  - BH 5552 for Profibus-DP

## Function

The input module operates several functions (e.g. 3 e-stop or 2-e-stop+1 enabling input) independent of each other. The module activates if for a selected function all enabling conditions are fulfilled.  
within a group functions can be selected that behave differently (see description of function)

## Notes

The modules BG 5915 and BH 5915 differ as follows:

- The modules BG 5915 have 8 inputs with one common ground (A2) and a width of only 22.5 mm.
  - For applications that require fully galvanic separated inputs the BH 5915 with 45 mm width is designed.

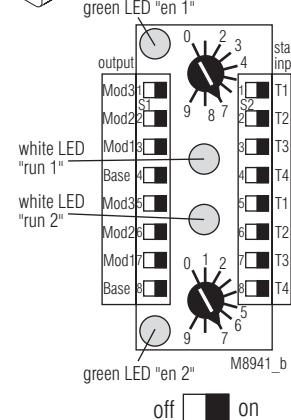

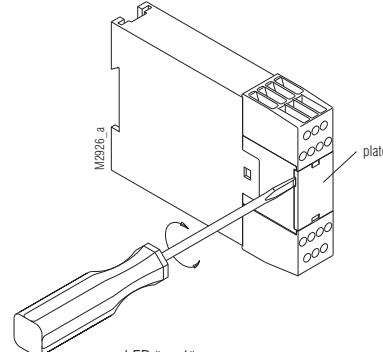

#### Indication

**Green LEDs:** on, when all inputs are present and start button activated

White LEDs Run 1/  
Run 2 and outputs  
48 and 58: indicate the current status of the module

## Setting of the Module

The control unit is assigned to the start inputs T1...T4 and the safety outputs via the DIP switches. The input function is set by means of the rotary switches. To prevent accidentally adjustments the setting switches are covered by a front plate and are redundant.

This module is enabled as soon as all conditions are fulfilled at a certain function. E.g. at setting position 2 enabled when (gate 1 or (gate 2 and gate 3) or (gate 2 and gate 4) are closed.

base = Output of control Unit  
mod = Output of output module

## Notes:

- Settings to the unit must be performed by skilled personnel while the unit is off-load.
  - Before the front cover is removed, potential equalization must be provided.

Maximum 3 input modules can be connected in series to the left connector of a control unit. the termination plug moves always from the control unit to the last module in the chain.

### Function setting

Poti	S12	S14	S22	S24	S32	S34	S42	S44
0	E-stop 1 or LC 1 (Manual-Start)		E-stop 2 oder LC (Manual-Start)		change over switch closed			
	E-stop 1 or LC 1 (Manual-Start)		E-stop 2 or LC (Manual-Start)				E-stop 3 or LC 3 (Automatic-start)	
1	E-stop 1 or LC 1 (Automatic-Start)		E-stop 2 or LC (Automatic-Start)		change over switch closed			
	E-stop 1 or LC 1 (Automatic-Start)		E-stop 2 or LC (Automatic-Start)				E-stop 3 or LC 3 (Automatic-Start)	
2	Gate 1 (250 ms)							
			Gate 2 (250 ms)		Gate 3 (250 ms)			
			Gate 2 (250 ms)				Gate 4 (250 ms)	
3	Double contact 1 (3s) Manual-Start		Double contact 2 (3s) Manual-Start		LC (250 ms) Manual-Start			
							Enabling switch (250 ms) (Automatic-Start)

5			Setting not allowed	(failure 5)				
6			Setting not allowed	(failure 5)				
7			Setting not allowed	(failure 5)				
8			Setting not allowed	(failure 5)				
9			Setting not allowed	(failure 5)				

## Notes:

With a LC type 4 (according to IEC/EN 61496-1), short-circuit monitoring takes place in the light curtain itself.

\* LG Light curtain

## Description of the different functions

**Note:** In this section all possible functions are described, that are available on the module. Which function is active depends on the setting of the selector switches of the module.

### Function Safety Gate

To detect a closed the following sequence has to be used:

1. All door contacts have to be open
2. All door contacts have to be activated in the required time span. If one contact comes to late all contacts have to be opened before they can be closed again.
3. The module is enabled as soon as all single functions in a group allow enabling.
4. The module is disabled as soon as one contact in the group is opened.

If no time is specified in the Table „Function setting“ the the default time to close the contacts is 3 s.

The required reclosing of already closed doors can be simulted by a start button that is assigned to the input module.

### Function E-Stop

An E-stop is operated as follows:

1. All contacts of the e-stop button must change from all open to all closed within the required time span or have to be closed already on power up of the module to enable the unit. If one contact is delayed all contacts have to be opened before a restart can be done.
2. If autostart is selected the unit is enabled as soon as all contacts are closed. If manual start is selcted the assigned start button has to be pressed in addition.
3. The module is enabled as soon as all single functions in a group fulfill the enabling conditions.
4. The module is disabled as soon as one contact in the group is opened.

If no time is specified in the Table „Function setting“ the the default time to close the contacts is 250 ms.

### Function Light Curtain (LC)

The function is equal to the estop function, only the wiring is different as the e-stop has contacts and the light curtain semiconductor outputs

**Note:** The module must only be used as safety device for light curtains with selftesting type 4 according to EN 61496. The short-circuit detection of the input circuit has to be done by the light curtain.

### Function Push Button or Selector Switch

The behavior is the same as with e-stop in automatic start mode. If no time is specified in the Table „Function setting“ the the default time to close the contacts is 250 ms.

## Function Enabling Switch (only for override function)

To enable a module the following sequence has to be operated:

1. Before detection activated signal from the enabling switch all its contacts have to be open
2. All contacts must be activated within the required time span.
3. A soon as one contact of the enabling switch gets inactive the module is disabled and condition 1. must be fulfilled again. If no time is stated in the function table the the time span to close all contacts is 500 ms.

**Note:** During override with the enabling switch the overridden function is active in the background. I.e. that the safety outputs open after end of override, when during override e.g. the contact of a door with manual reset are opened and closed again.

### Function Start- or Simulation Button

the start or simulation button must not be oerated longer then 3 sec to activate the module. The start button to be used is selected via dip switch setting from the available start inputs of the control unit and assigned to the module.

It is possible to assign several start buttons to one module.

### Connection of Actuators

The actuators have to be connected as stated in the connection diagrams. When actuators with semiconductor outputs are used the module does not detect any crossfaults between the signals. The crossfault then must be detected by the actuator itself. E.g. light barrier type 4 to EN 61469).

## Indicators

	Permanently OFF	Pulsing	Permanent ON
Output 48	all relays inactive due to system error	one input function not available	Activation of the assigned safety outputs is permissible
LED Run 1	Two-hand control not active (LED run 2 ON) or all relays inactive due to system error	one input function not available (LED run 2 ON) or system error when LED Run 2 is OFF or flashing	Activation of the assigned safety outputs is permissible
Output 58	Activation of the assigned safety outputs is permissible or system error	Wait for start	one input function not available
LED Run 2	all relays inactive due to system error	all relays inactive due to system error	no system error

## Indication of System Errors

These errors are indicated by flashing codes of the white LEDs Run 1 and/or Run 2. The green LEDs and all outputs turn inactive. The system will only restart after the supply voltage has been switched off and on again.

### Error codes\*

- 0) (both white LEDs are off):  
Another input module indicates a system error.
- 1) To 4): not used
- 5) Incorrect setting of function:
  - The rotary switches for channel 1 and 2 have different or incorrect positions
  - The setting of the 4 upper Dip-switches (channel 1) are not identically to the 4 lower Dip-switches (channel 2)
- 6) LED Run 1 flashes: Undervoltage  
LED Run 2 flashes: Overvoltage
- 7), 8) Not used
- 9) Connection error between the input modules  
No terminating connector available.  
- Control or input module defective
- 10), 11), 12), 13) a. 14) Internal errors

\* number of short flashing impulses, followed by a longer space

## Function Error Indication

Function errors are indicated by the white LED Run 1 and by the output 48. During this time, the white LED Run 2 remains on. Output 58 remains on as long as the error is pending; it flashes regularly while waiting for the assigned start signal.

### Error codes\*

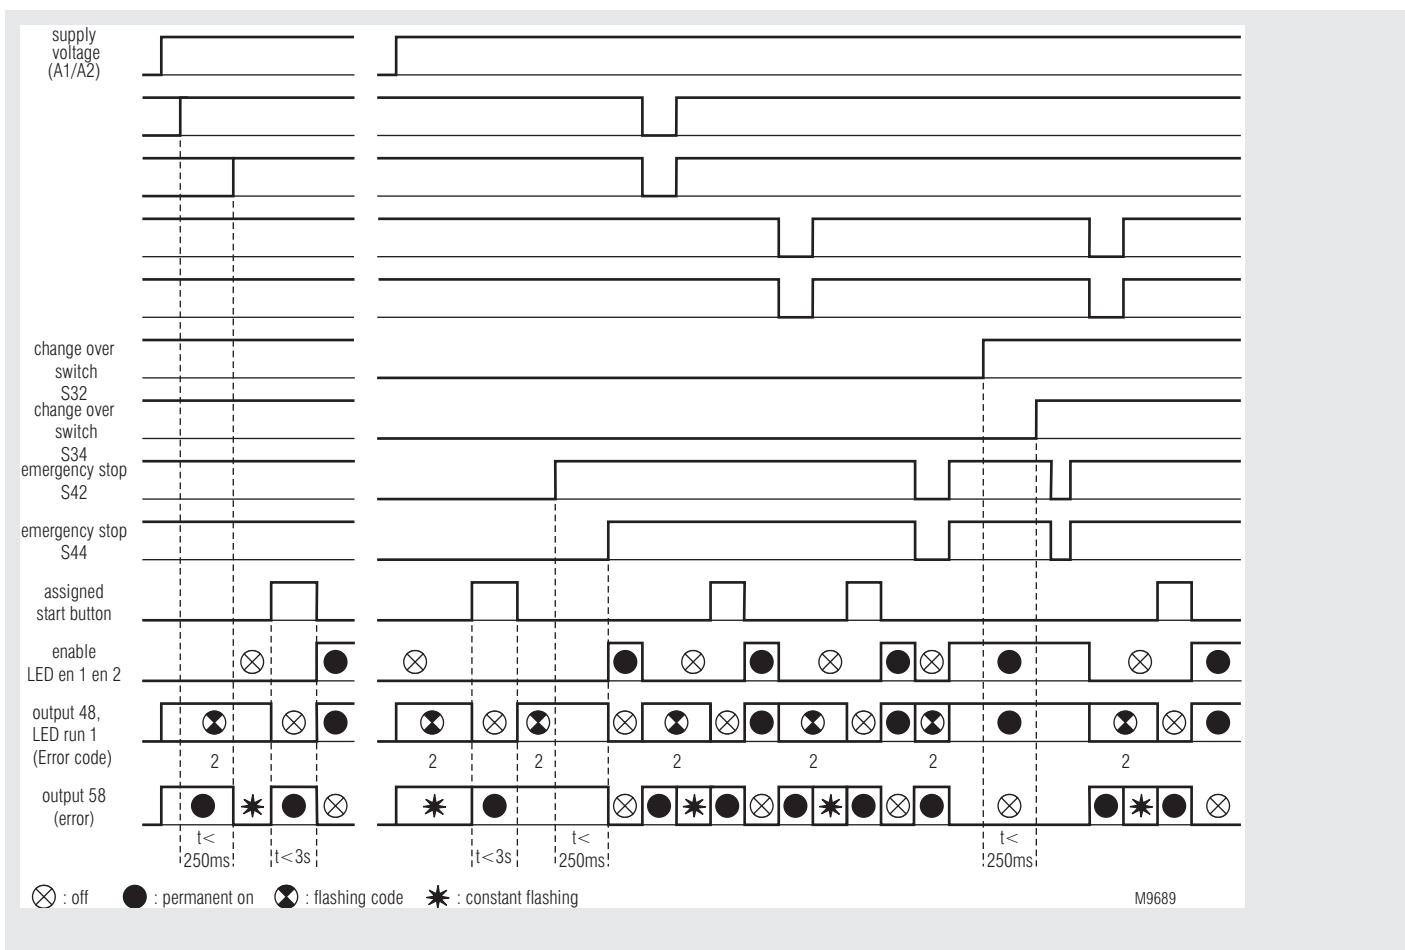

- 1) Gate open
  - Enabling switch open, all other protection contacts closed operating mode 3, only on start-up
- 2) E-stop contacts or double contact open, light curtain interrupted
- 3) Timing error: The signals of a selected function are not activated in the required time (250ms with e-stop or light curtain and gate function). For a new activation both channels must be off.
- 4) Error at start or simulation input (kept pressed to long) activated on power up or during a failure.
- 5) Input error (short-circuit, interruption)
- 6) Error in the control unit (input or output error detected in the control unit)

\* number of short flashing impulses, followed by a longer space

# Safety Technique

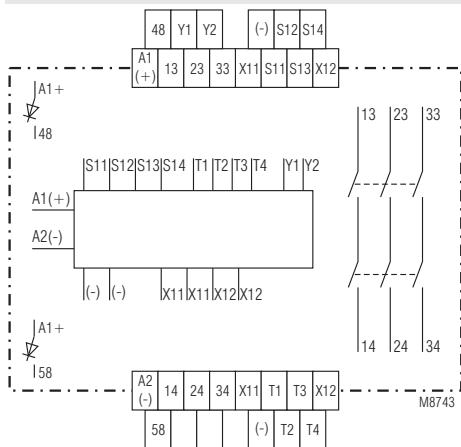

## Multi-Function Safety System SAFEMASTER M Control Unit BH 5911

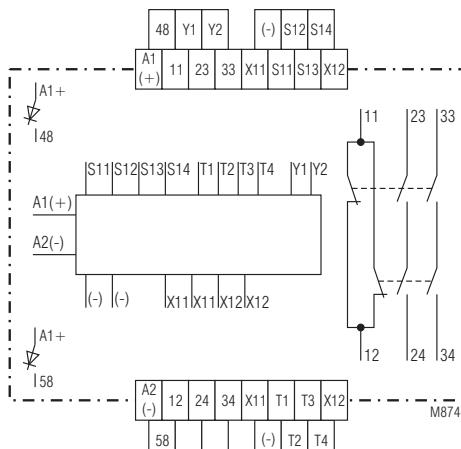

0247385

### Circuit Diagrams

BH 5911.03

BH 5911.22

- According to

- Performance Level (PL) e and category 4 to EN ISO 13849-1: 2008
- SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
- Safety Integrity Level (SIL 3) to IEC/EN 61508

- For emergency stop function, the following inputs and outputs are available:

Inputs: 4 monitored start inputs, or  
3 start inputs and 1 stop input and  
2 Emergency stop inputs

Outputs: 3 NO contacts, or  
2 NO contacts/1 NC monitoring contact

- Parallel connection of several SAFEMASTER M-systems possible

- The functions are selected via rotary switch

- 1 Emergency stop circuit, 2-channel
- 2 Emergency stop circuits, single-channel
- 1 Emergency stop circuit, 2-channel + 1 stop single channel

- Auto or manual start

- 2 semiconductor outputs for status indication

- LEDs for status indication

- Overvoltage and undervoltage monitoring function with error indication

- Permanently monitored feedback loop to connect external contactors

- Broken wire and short circuit monitoring function with error indication

- Width: 45 mm

### Approvals and Markings

### Applications

Realization of fail-safe control circuits for protection of people and machinery

### Input Terminal Assignment

Terminal	Signal
S11	Emergency stop button 1
S12	
S13	Emergency stop button 2
S14	
X11-T1	Start button 1
X11-T2	Start button 2
X12-T3	Start button 3
X12-T4	Start button 4 or stop
Y1-Y2	Feedback loop for external contact extensions

### General Information SAFEMASTER M

The maximum configuration of the SAFEMASTER M multi-function safety system is as follows:

- the control unit BH 5911
- up to 3 input modules BG/BH 5913, or BG/BH 5914, BH/BH 5915
- up to 3 output modules BG 5912
- 1 diagnostic module BG 5551 for CANopen, or
- 1 diagnostic module BG 5552 for Profibus-DP

The BH 5911 controls the whole system.

The input/output modules can be used to expand the control unit in a modular way into a multi-functional safety system.

To transmit status messages of the individual modules to a monitoring or control unit, one of the following diagnostic modules may be connected:

- BG 5551 for CANopen
- BH 5552 for Profibus-DP

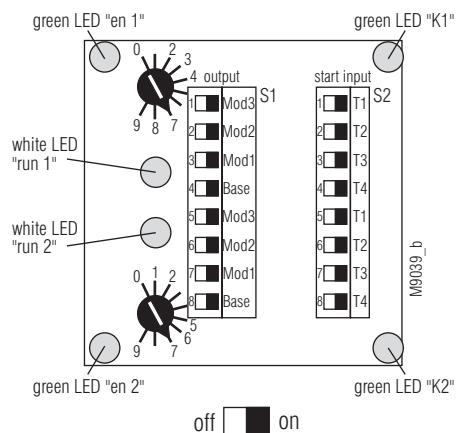

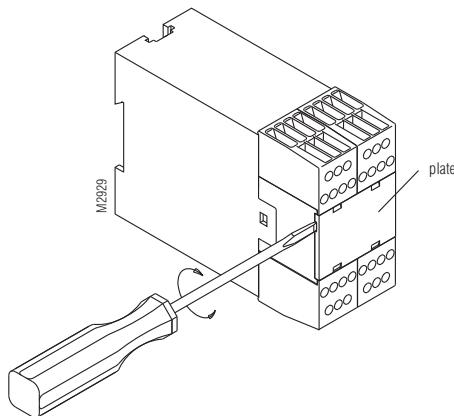

## Indication

- Green LEDs (left): on, when all inputs are present and start button activated.
- Green LEDs (right): on, when the safety outputs of the control unit are activated.
- White LEDs Run 1 and Run 2 and semiconductor outputs 48 and 58: Indicate the current status of the control unit.

## Setting of Functions

The control unit is assigned to the start inputs T1...T4 and the safety outputs via the DIP switches. The input function is set by means of the rotary switches. To prevent accidentally adjustments the setting switches are covered by a front plate and are redundant.

The control unit is supplied with two fitted terminating connectors. When the control unit is equipped with extension modules, remove these terminating connectors and plug them to the last interconnected device. When a diagnostic module is used, it is connected instead of the terminating connector.

base = Output of control Unit  
mod = Output of output module

### Notes:

- Settings to the unit must be performed by skilled personnel while the unit is disconnected.
- Before the front cover is removed, antistatic precautions must be observed.

## Notes

- Settings to the unit must be performed by skilled personnel while the unit is disconnected.
- Before the front cover is removed, antistatic precautions must be observed.

Sw	Function	Start input selection	Start function setting conditions
0	1 E-stop or 1 LC* 2 channel	4 start inputs	Automatic start lock-out following undervoltage
1	2 E-stop 1 channel	4 start inputs	
2	1 E-stop or 1 LC* 2 channel	3 start inputs 1 Stop	
3		not permitted (error 5)	
4	1 E-stop or 1 LC* 2 channel	4 start inputs	Manual start
5	2 E-stop 1 channel	4 start inputs	
6	1 E-stop or 1 LC* 2 channel	3 start inputs 1 Stop	
7	1 E-stop or 1 LC* 2 channel	3 start inputs 1 Stop	
8	1 E-stop or 1 LC* 2 channel	4 start inputs	Automatic start following undervoltage, restart after the voltage has returned to the permissible value
9	2 E-stop 1 channel	4 start inputs	

\* LC = light curtain

## Automatic Start

Automatic start is only performed when the supply voltage is switched on or when the Emergency stop or stop function has been reset (with switch positions 7 to 9, also after undervoltage).

All other errors nevertheless require confirmation by a start input.

## Manual Start

The start input must not be pressed for more than 3 seconds to start the system. Alternatively, several start inputs may be assigned to one module.

## Stop

Instead of the fourth start button, an additional stop input (NC contact) can be connected. It is assigned only to the control unit and treated like an additional single-channel emergency stop button.

This means that the safety outputs assigned to the control unit can only be activated if neither the emergency stop or the stop button are activated.

If operating function 2, 6 or 7 is selected, an assignment to the start input 4 will remain ineffective in all connected modules.

## Lock-Out after Undervoltage

When an undervoltage is detected, the whole system (including any extension modules) turns off (auto reset). There are two different options of auto restart:

1. The system de-energises the safety outputs as soon as undervoltage has been detected.  
There after the system will only reset after complete removal of voltage.
2. The system de-energises the safety outputs and remains de-energized until supply voltage is back to a permissible value. Then, the system is restarted.

## Shortcircuit and Crossfault Detection

The control unit has an integrated dynamic shortcircuit and crossfault detection. This feature can only be used when the inputs are switched by contacts and if they are only connected to one safemaster input.

To connect light curtains of type 4 or to operate several safemaster M units from common sensors a special wiring has to be chosen.

## Indication of System Errors

These errors are indicated by flashing codes of the white LEDs Run 1 and/or Run 2. The green LEDs and all outputs turn inactive. The system will only restart after the supply voltage has been switched off and on again.

### Error codes\*

- 0) (both white LEDs are off):  
Another input module indicates a system error.
- 1) To 4): not used
- 5) Incorrect setting of function:
  - The rotary switches for channel 1 and 2 have different or incorrect positions
  - The setting of the 4 upper Dip-switches (channel 1) are not identically to the 4 lower Dip-switches (channel 2)
- 6) LED Run 1 flashes: Undervoltage  
LED Run 2 flashes: Overvoltage
- 7), 8) Not used
- 9) Connection error between the input modules
  - No terminating connector available.
    - Control or input module defective
- 10), 11), 12), 13) a. 14) Internal errors

\* number of short flashing impulses, followed by a longer space

## Status Indicator

	Permanently OFF	Pulsing	Permanent ON
Output 48	all relays inactive due to system error	Function error	Activation of the assigned safety outputs is permissible
LED run 1	all relays inactive due to system error	Function error when LED Run 2 is ON, or system error when LED Run 2 is OFF or flashing	Activation of the assigned safety outputs is permissible
Output 58	Activation of the assigned safety outputs is permissible or system error	Waiting for start signal	Function error
LED run 2	all relays inactive due to system error	all relays inactive due to system error	No system error

## Indication of Function Errors

Function errors are indicated by the white LED Run 1 and by the output 48. During this time, the white LED Run 2 remains on. Output 58 remains on as long as the error is pending; it flashes regularly while waiting for the assigned start signal.

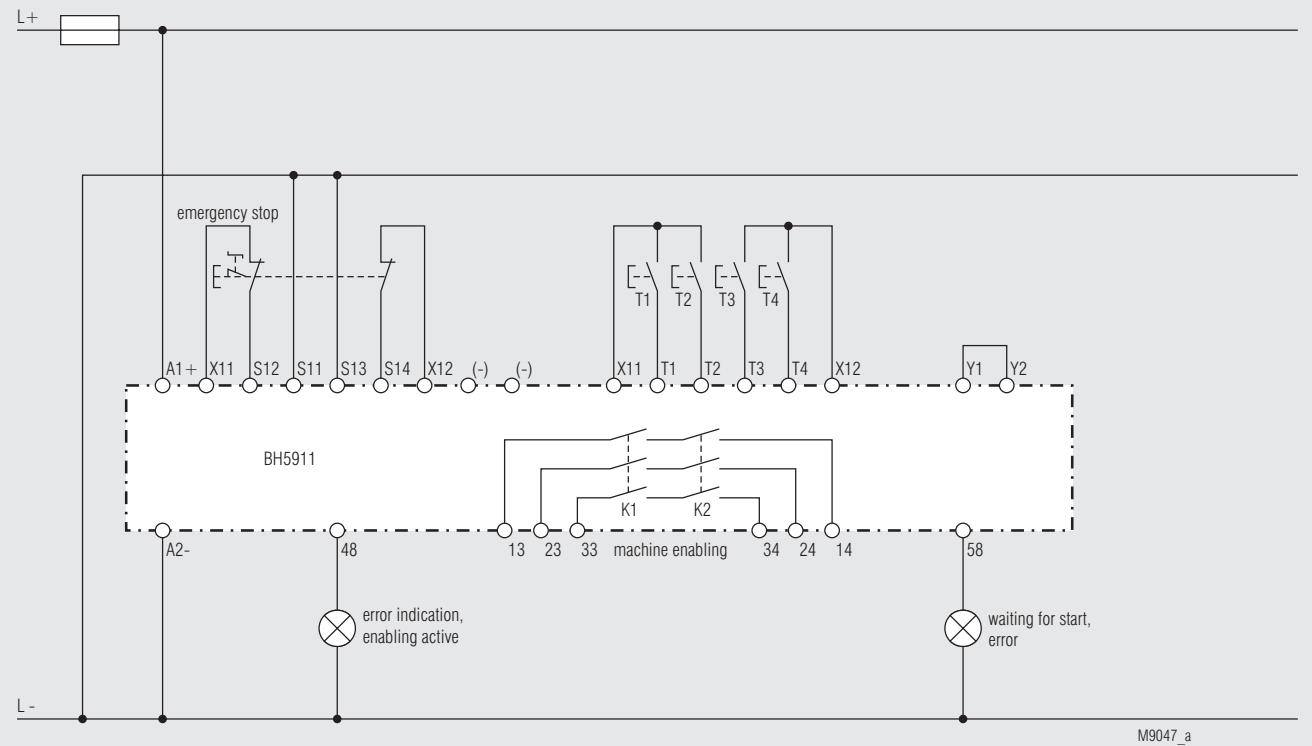

### Error codes\*

- 1) First Emergency stop contact open
- 2) Second Emergency stop contact open
- 3) Stop contact open
- 4) Error start input
- 5) Input error (interruption or short-circuit)
- 6) Output error at the safety output of the control unit or at the safety outputs of the extension modules (feedback loop interrupted, assigned output module does not exist).
- 7) Error at the twin contacts of the Emergency stop button

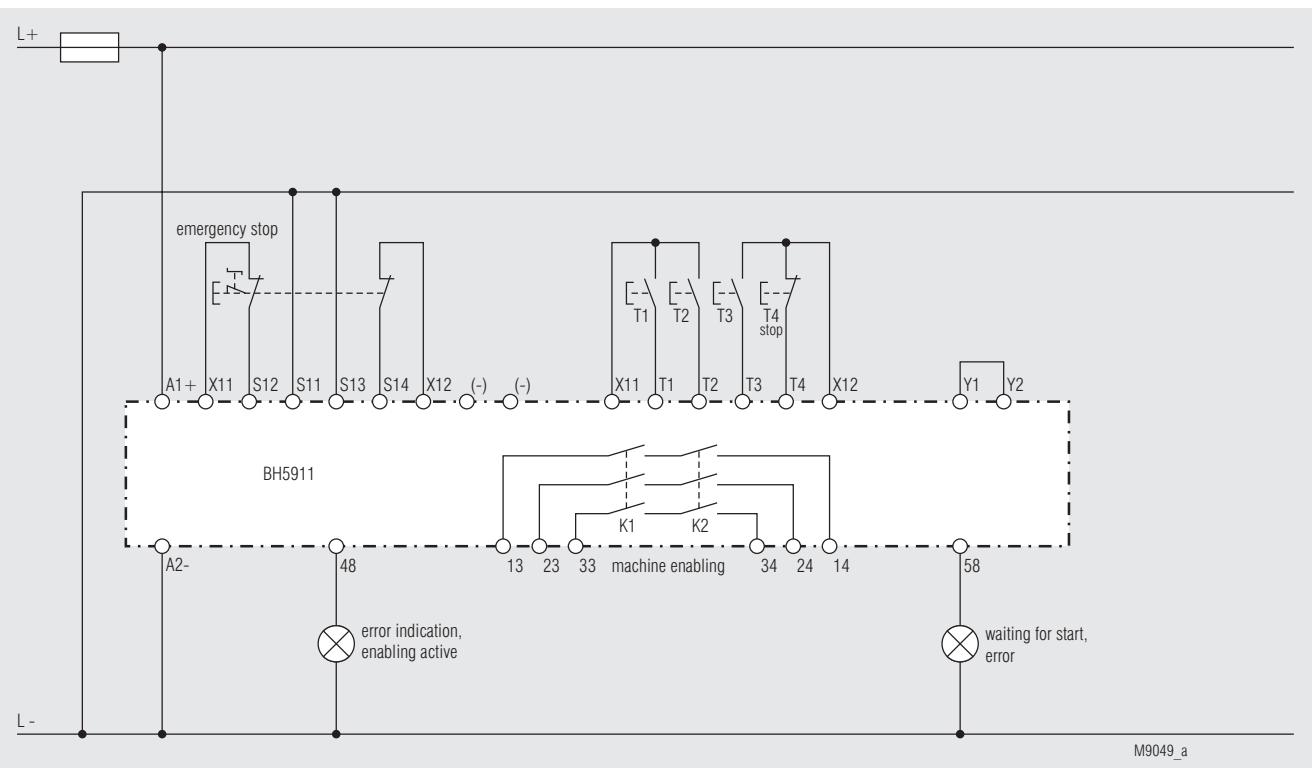

\* number of short flashing impulses, followed by a longer space

In case of error 5) and 6), the LEDs Run 1 and the outputs 48 to 58 of the inputs modules which permit activation of the safety outputs flash fast and regularly until the error is remedied and acknowledged by a start signal assigned to the control unit.

## Application Examples

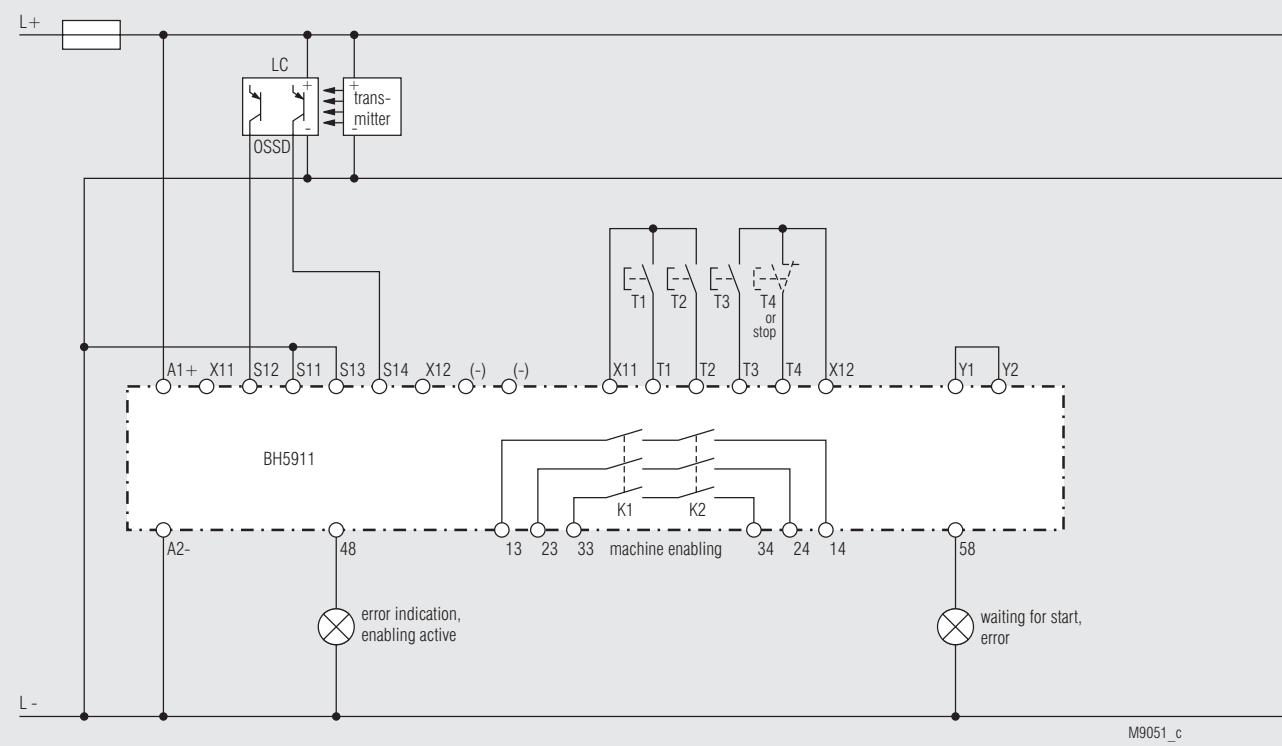

1 Emergency stop, 2-channel; setting: 0, 4 or 8

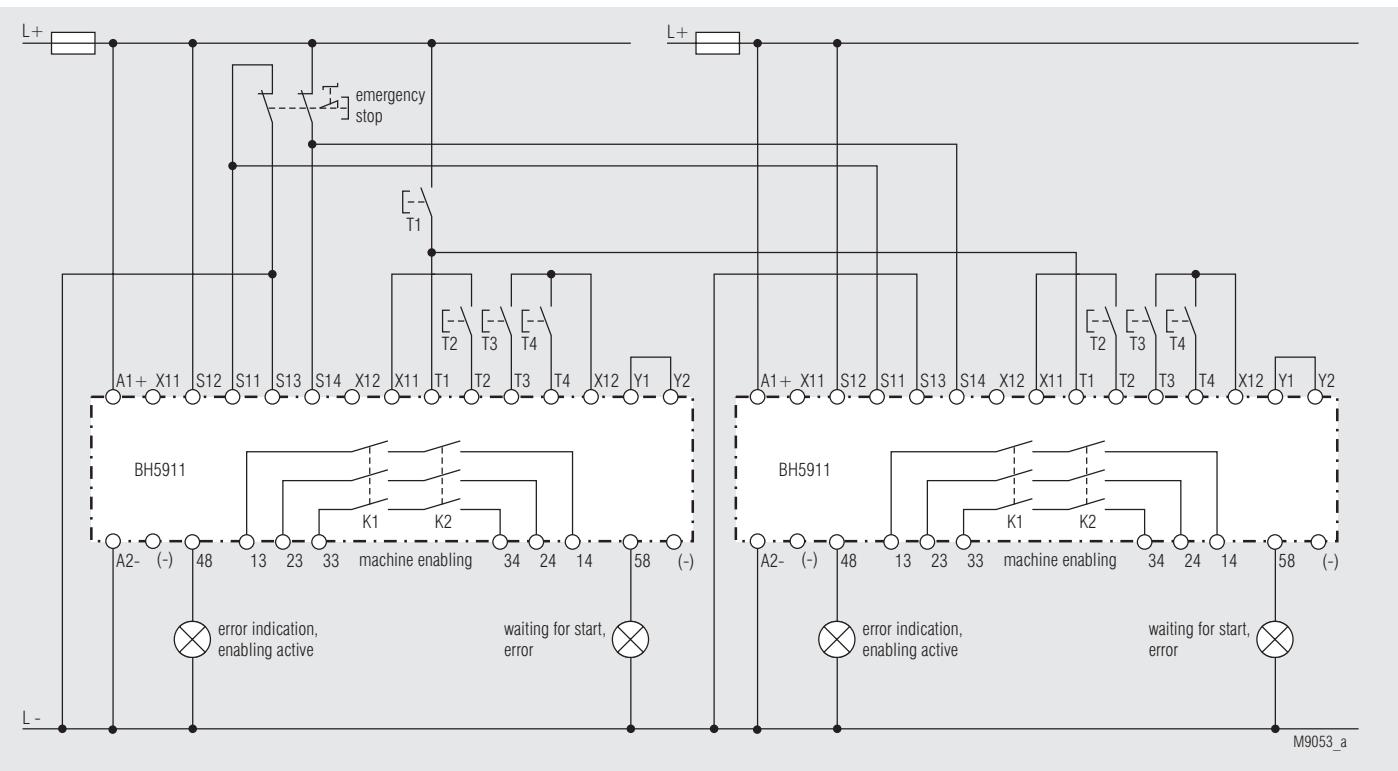

1 Emergency stop, 2-channel + stop, only 3 start inputs; setting: 2, 6 or 7

## Application Examples

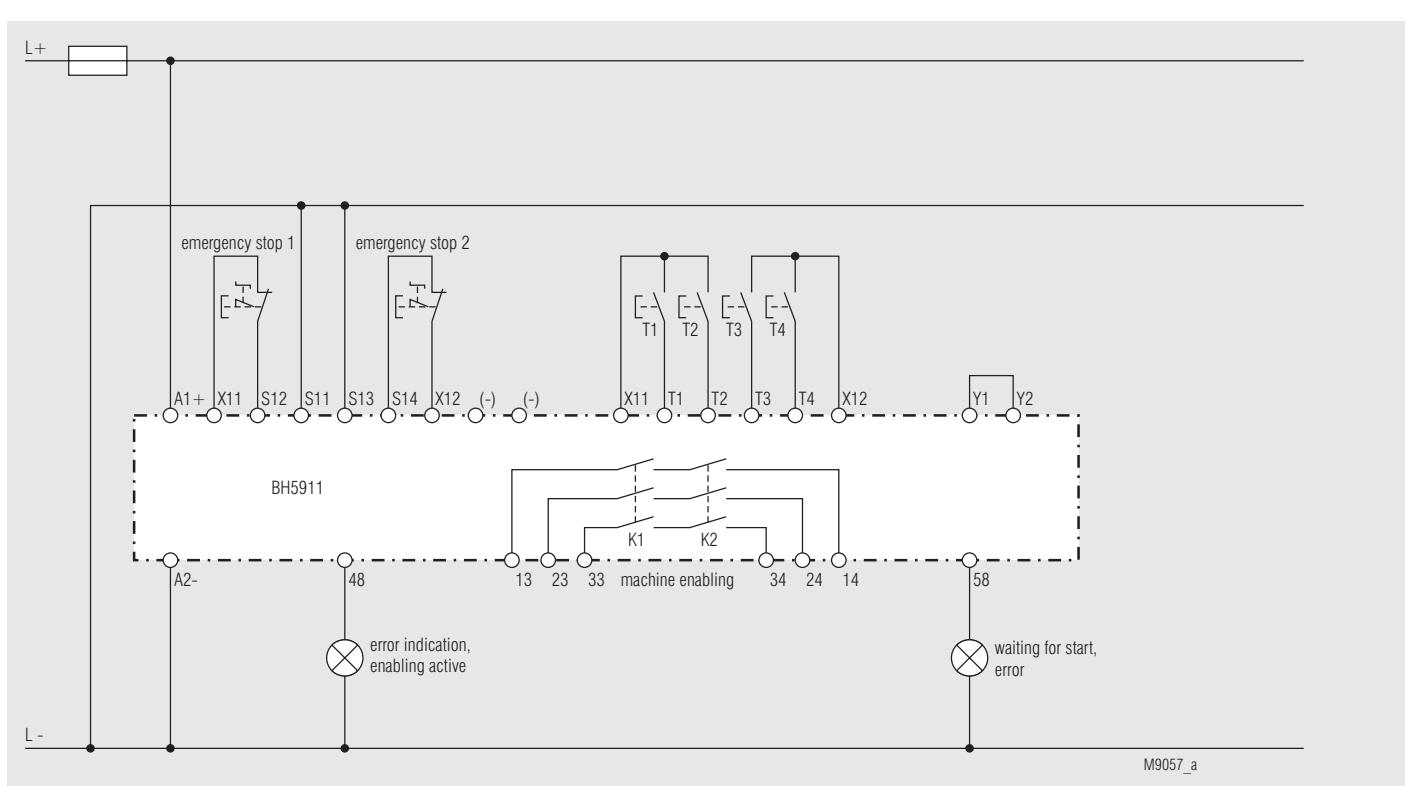

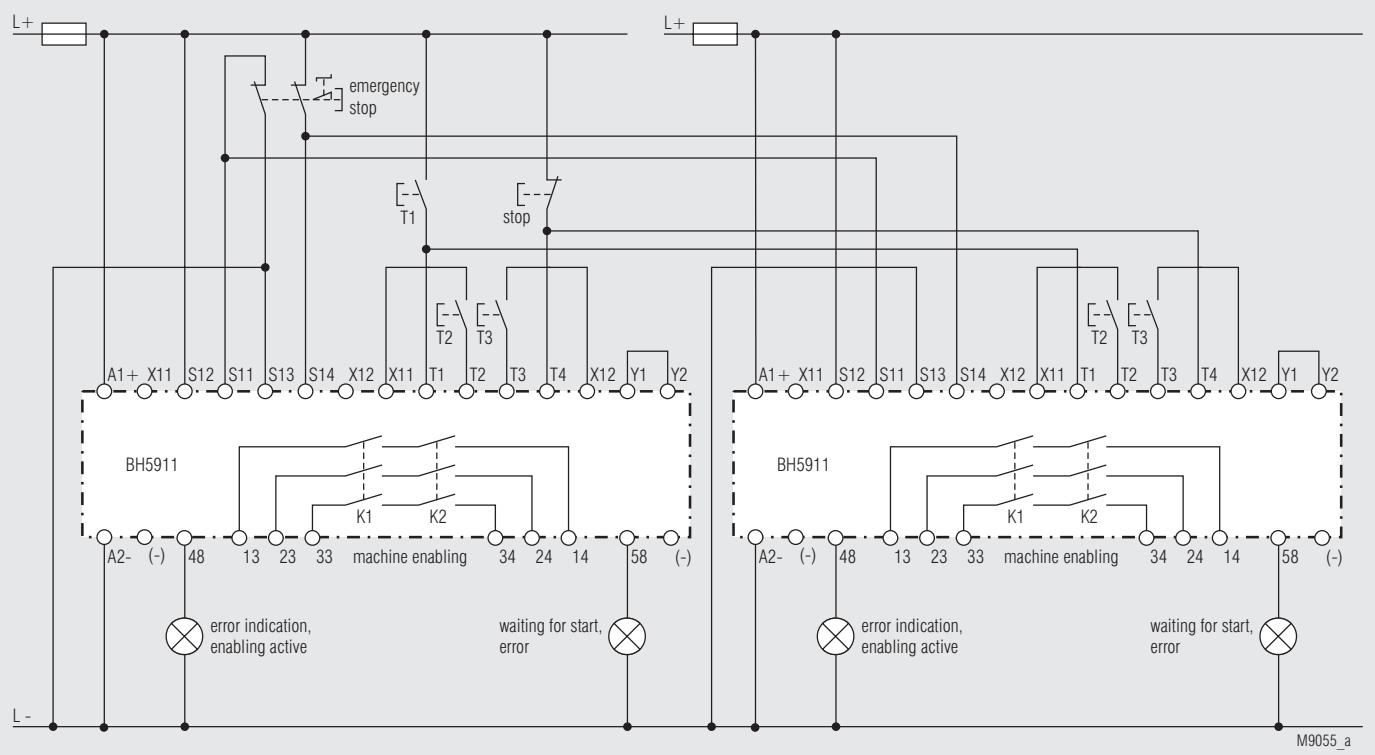

Light curtain type 4 + stop, only 3 start inputs; setting: 2, 6 or 7

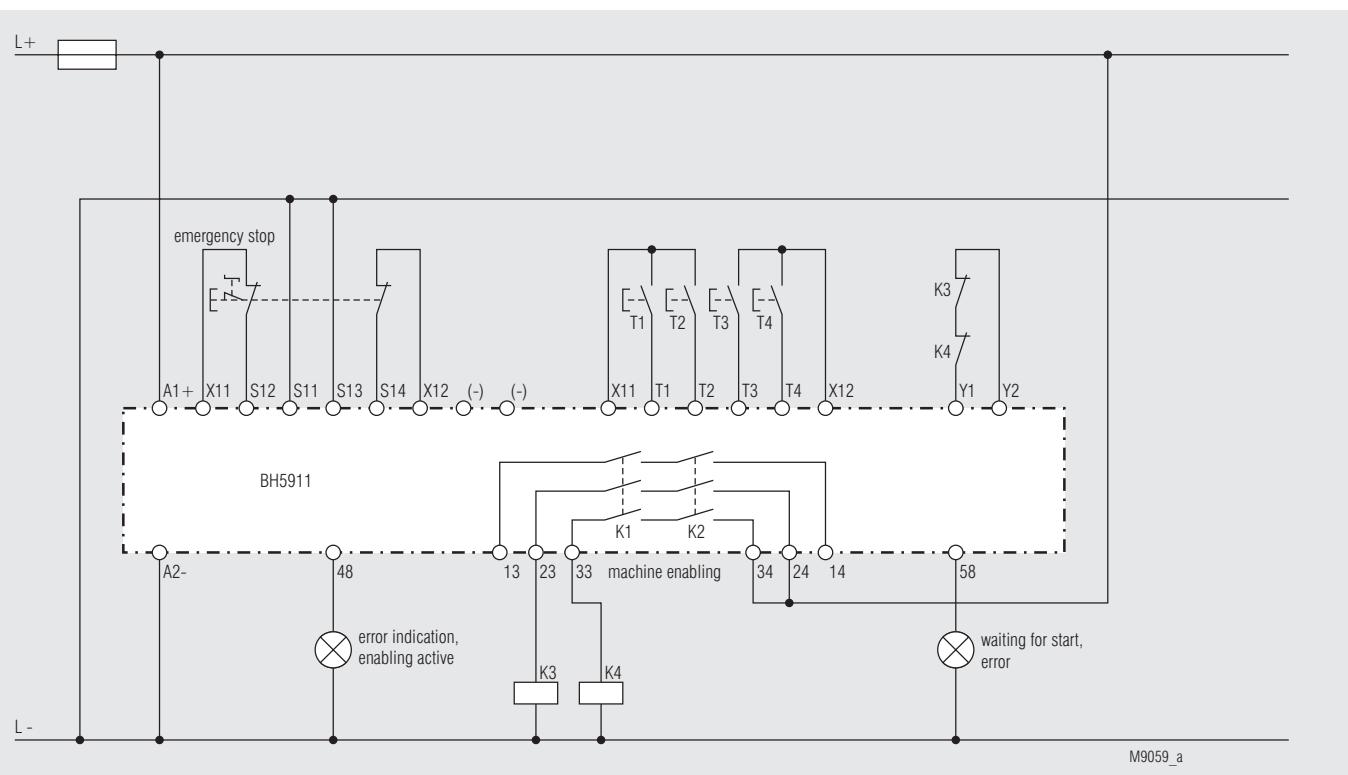

Emergency stop, 2-channel and 1 start input operating 2 safemaster M in parallel; setting: 0, 4, or 8

## Application Examples

## Application Examples

Emergency stop, 2-channel, 4 start inputs, contact reinforcement; setting: 0, 4 or 8

### Technical Data

<b>Nominal voltage <math>U_N</math>:</b>	DC 24 V
<b>Voltage range:</b> with max. 5% residual ripple:	0.85 ... 1.15 $U_N$
<b>Nominal consumption</b> <b>BH 5911:</b>	max. 140 mA (no load on semiconductor outputs)

#### Input

<b>Control voltage on</b> <b>X11, X12, 48, 58:</b>	DC 23 V at $U_N$
<b>Control voltage on</b> <b>S11, S12, S13, S14,</b> <b>T1, T2, T3, T4:</b>	4.5 mA each at $U_N$
max. wire length to sensors with contacts:	100 m
<b>Minimum voltage at</b> <b>terminals S12, S14</b>	DC 16 V
<b>Short-circuit protection</b> <b>of the modules:</b>	Internally with PTC

#### Output

<b>Contacts</b>			
BH 5911.03:	3 NO contacts		
BH 5911.22:	2 NO contacts, 1 NC contact (The NC contact must not be used as a safety output!)		
<b>Contact type:</b>	Relay, forcibly guided		

#### Typ. make time with $U_N$ :

Control unit BH 5911	Manual start	Auto start	
		First start	Restart
Emergency stop	max. 75 ms	max. 1 s	max. 90 ms

#### Break time (reaction time):

Control unit BH 5911	
Emergency stop	max. 27 ms

#### Fault clearing

<b>in the feed back loop:</b>	max. 600 ms
<b>Output nominal voltage:</b>	AC 250 V
<b>Switching of small loads:</b>	DC: see limit curve for arc-free operation ≥ 100 mV

#### Thermal current $I_{th}$ :

max. 5 A (see quadratic total current limit curve)

#### Switching capacity to AC 15

NO contact:	3 A / AC 230 V	IEC/EN 60 947-5-1
NC contact:	2 A / AC 230 V	IEC/EN 60 947-5-1
to DC 13:	DC8 A / DC 24 V at 0.1 Hz	IEC/EN 60 947-5-1

#### Contact life

acc. to AC 15 with 2 A, AC 230V:  $10^5$  switching cycles IEC/EN 60 947-5-1

#### Permissible switching frequency:

max. 1 200 switching cycles / h

#### Short circuit strength

max. fuse rating	6 A gL	IEC/EN 60 947-5-1
Line circuit breaker	C 8 A	

#### Mechanical life:

10  $\times 10^6$  operating cycles

#### Semiconductor Outputs

Output (terminal 48 and 58):	Transistor outputs, plus-connected
Output nominal voltage:	DC 24 V, max. 100 mA constant current, max. 400 mA for 0.5 s internal short circuit, overtemperature and overload protection

#### General Data

#### Operating mode:

Continuous

#### Temperature range:

$\pm 0 \dots + 50^\circ\text{C}$

At an operating temperature of 50 °C the modules must be mounted with a distance of 3 - 5 mm.

#### Clearance and creepage distances

rated impulse voltage /  
pollution degree:

4 kV / 2 (basis insulation) IEC 60 664-1

**EMC:** IEC/EN 61 326-3-1, IEC/EN 62 061

Radio interference suppression: Limit value class A EN 55011

**Remark:** This device is designed for industrial ambient conditions. When used in other environment, it is possible that wire bound or radiated interference occurs.

#### Degree of protection

Housing:	IP 20	IEC/EN 60 529
Terminals:	IP 20	IEC/EN 60 529
<b>Housing:</b>	Thermoplast with V0 behavior according to UL Subject 94	

## Technical Data

<b>Vibration resistance:</b>	Amplitude 0.35 mm Frequency 10 ... 55 Hz, IEC/EN 60 068-2-6
<b>Shock resistance:</b>	Acceleration: 10 g Pulse duration: 16 ms Number of shocks: 1000 per axis on three axes
<b>Climate resistance:</b>	0 / 050 / 04 IEC/EN 60 068-1 EN 50 005
<b>Terminal designation:</b>	
<b>Wire connection:</b>	1 x 2.5 mm <sup>2</sup> stranded wire with sleeve, or 1 x 4 mm <sup>2</sup> massive, or 2 x 1.5 mm <sup>2</sup> stranded wire with sleeve DIN 46 228-1/-2/-3/-4
<b>Wire fixing:</b>	Plus-minus terminal screws M3,5 box terminals with wire protection
<b>Surge suppression:</b>	When connecting inductive loads to the relay outputs (contactor coils, valves, electric brakes) surge suppressor elements like diodes, capacitors, RC combinations, etc. have to be connected directly to the connection terminals of the controlled devices, keeping the connection wires as short as possible.
<b>Mounting:</b>	DIN rail IEC/EN 60 715

## Dimensions

Width x height x depth: 45 x 84 x 121 mm

## Ordering Example

BH 5911.03/00MF0 DC24V 3 NO contacts  
BH 5911.22/00MF0 DC24V 2 NO contacts, 1 NC contact

## Characteristics

## Limit curve for arc-free operation

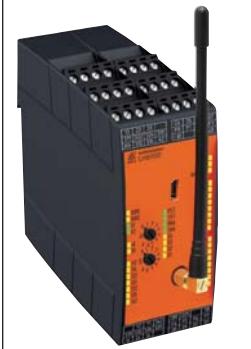

quadratic total current

$$\Sigma I^2 = I_1^2 + I_2^2 + I_3^2 + I_4^2$$

I<sub>1</sub>, I<sub>2</sub>, I<sub>3</sub>, I<sub>4</sub> - current in contact paths

Quadratic total current limit curve

0275574

## Your Advantages

- Higher safety in dangerous areas
- More efficiency and economy by wireless communication
- Compact, easy to install devices
- DIN rail mounting
- Removable terminal blocks
- Adjustable functions via rotary switch:
  - Full safety operation with different start modes (two-hand type IIIA and/or manual start, auto start)
  - Cross-operation with different start modes (two-hand type IIIA and/or manual start, auto start)
  - Safety operation with optional radio control with different start modes (manual start on S42, manual start via radio, or auto start)
- Valid for all operating modes:
  - Start function via radio with or without detection of an additional start signal at the IIR input.
- Frequency range 433 MHz or 869 MHz (license-free radio frequencies)
- Radio channel, transmitter power, and module name can be set by means of a parameterization software
- Status indicator for the devices connected via radio, by means of the parameterization software including status of radio transmission quality

## Features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508 and IEC/EN 61511
- Machine directive 2006/42/EG
- DIN EN 574: Safety of machinery - Two-hand control devices -
- DIN EN 300 220: Electromagnetic compatibility and Radio spectrum Matters (ERM) - Short Range Devices (SRD) - Radio equipment to be used in the 25 MHz to 1000 MHz frequency range with power levels ranging up to 500 mW
- Depending on the operating mode, to connect:
  - E-stop push-button (2-channel), safety gate, LC (non-contact safety system, for example light curtain) of the type 4 in accordance with EN 61 496 or the two-hand type IIIA in accordance with DIN EN 574.
  - 1 start button
  - Changeover switch (2-channel) to indicate radio use in the Safety operation with optional radio control operating mode
- For two-way communication via radio:
  - Safety shut-down commands
  - Signals from 8 non-safety-relevant DC 24 V inputs at 8 non-safety-relevant DC 24 V semiconductor outputs
- Broken wire and short circuit monitoring function with error indication
- Semiconductor output to indicate poor or missing radio control
- 2 semiconductor outputs for status indication
- LEDs to indicate
  - status of module
  - status of all inputs and outputs
  - the radio transmission and its quality
- Width: 45 mm

## Approvals and Markings

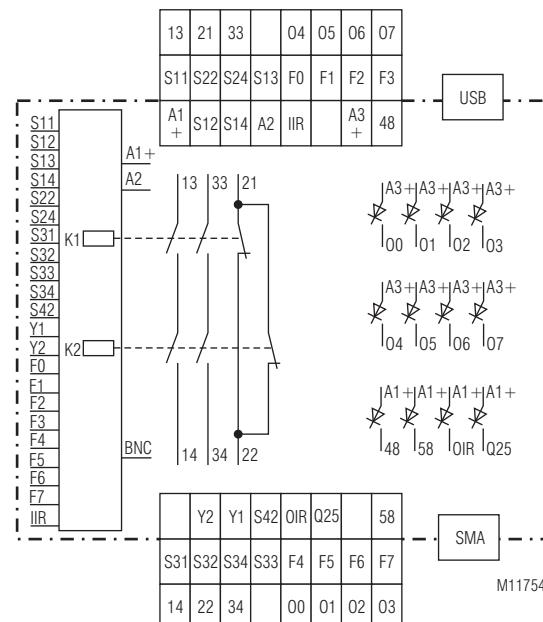

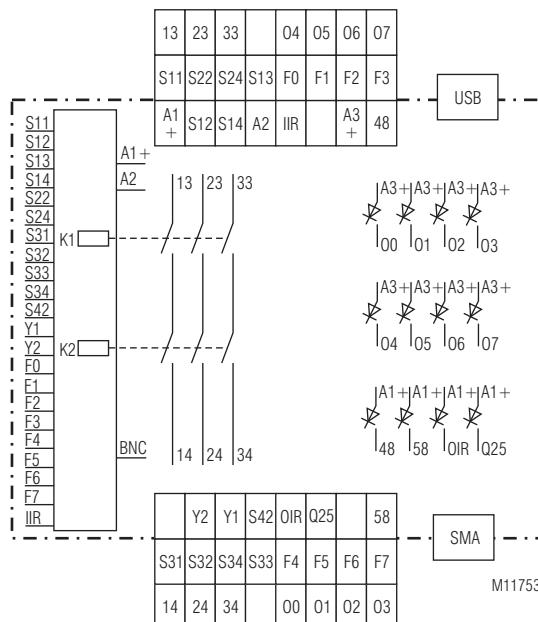

## Functions

Each UH 6900 radio controlled safety module is installed in a switch cabinet or on a mobile device and is operated with a plug-in or external antenna. It detects the signals of up to three wired safety elements plus the signals from the related second active radio controlled safety module that are sent through a safe radio transmission. Safety-relevant switching commands are switched by relay outputs, non-safety-relevant control signals through semiconductor outputs.

In addition, a non-contact sender and a non-contact receiver (for example, light curtain or infrared sender and receiver) may be connected to force the system to start from a specific location via radio.

## Circuit Diagrams

## Connection Terminals

Terminal designation	Signal description
A1+	DC 24 V supply voltage for radio controlled safety module

## Inputs and Outputs

### Inputs

- 3 two-channel safety inputs DC 24 V
- 1 DC 24 V input for start button
- 1 feedback circuit to monitor external relays
- 1 DC 24 V input that can be used as start signal in addition to the start signal received via radio
- 8 non-safety-relevant DC 24 V functional inputs, the status of which is sent to the opposite side

### Outputs

- 3 safety-relevant NO contacts or 2 safety-relevant NO contacts + 1 NC contact  
(can only be used as an indicator contact)
- 1 DC 24 V semiconductor output that reproduces the start signal sent via radio as an additional start signal for the release of the safety relay on the opposite side
- 8 non-safety-relevant DC 24 V semiconductor outputs that are controlled by the opposite side
- 2 DC 24 V semiconductor outputs to display the status of the radio-controlled safety module
- 1 non-safety-relevant DC 24 V semiconductor output to indicate poor or missing radio control

## Technical Data

### Semiconductor outputs

Outputs (terminals 48, 58, O0 bis O7, OIR, Q25): transistor outputs, switching +  
 Nominal output voltage (A3+): DC 24 V  
 Nom. output voltage at  $U_N$ : min. DC 23 V, max. 100 mA cont. current  
 max. 400 mA für 0.5 s internal short circuit, over temperature and overload protection.  
 For inductive loads, arrange the necessary safety measures  
 Min. operating current: min. 1 mA  
 Residual current: min. 0.1 mA

### General Data

**Operating mode:** Continuous operation  
**Temperature range**  
 Operation: - 25 ... + 55 °C  
 Storage: - 40 ... + 80 °C  
**Altitude:** < 2.000 m  
**Clearance and creepage distance**  
 rated impuls voltage / pollution degree:  
 circuit / contact: 6 kV / 2 IEC 60 664-1  
 contact / contact: 4 kV / 2 IEC 60 664-1  
 Overvoltage category: III  
**EMC**  
 Interference suppression:  
**Degree of protection:**  
 Housing: IP 40 IEC/EN 60 529  
 Terminals: IP 20 IEC/EN 60 529  
**Enclosure:** Thermoplastic with V0 behaviour according to UL subject 94  
**Vibration resistance:**  
 Shock proof:  
 Acceleration: 10 g  
 Impulse length: 16 ms  
 Number of shocks each polarity and each axes: 1000  
**Climate resistance:** 25 / 055 / 04 IEC/EN 60 068-1  
**Terminal designation:** EN 50 005  
**Wire connection:** captive slotted screw or cage clamp terminals  
**Mounting:** DIN-rail IEC/EN 60 715  
**Weight:** 380 g

### Dimensions

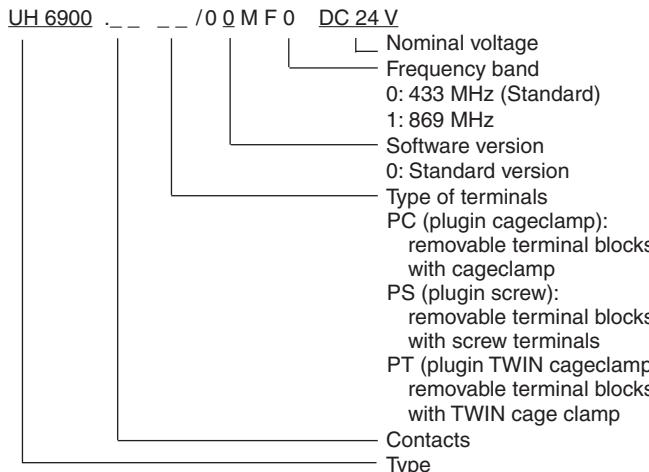

**Width x height x depth:** 45 x 107 x 121 mm

## Standard Type

UH 6900.03PS / 00MF0 DC 24 V  
 Article number: 0067213  

- Output: 3 NO contacts
- Nominal voltage  $U_N$ : DC 24 V
- Frequency band: 433 MHz
- Width: 45 mm

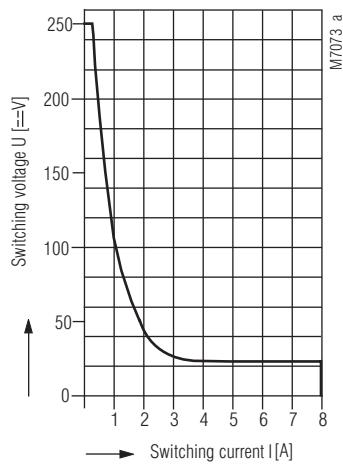

### Ordering Example

### Maintenance and Repairs

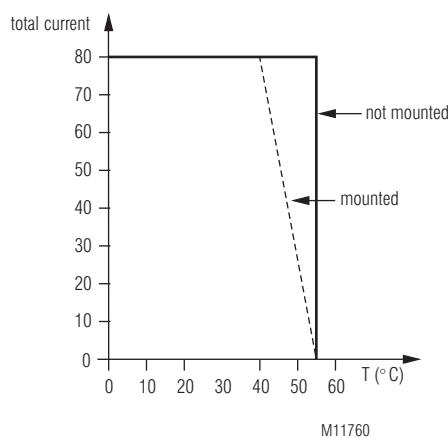

- The device contains no parts that require maintenance.
- In case of failure, do not open the device but send it to manufacturer for repair.

## Characteristics

safe breaking, no continuous arcing  
under the curve, max. 1 switching cycle/s

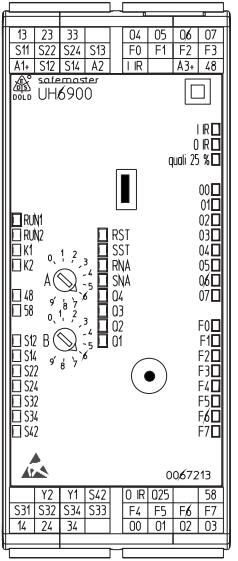

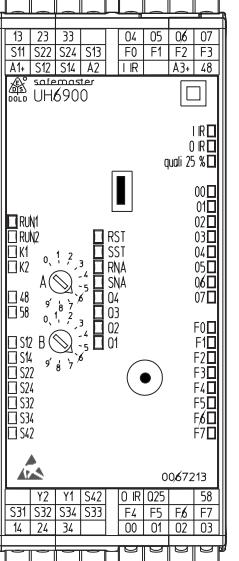

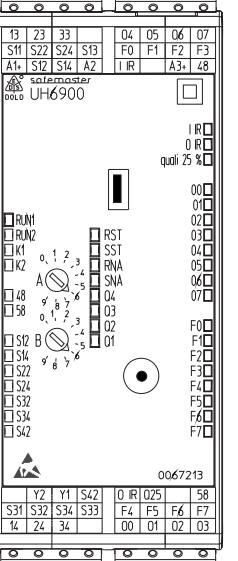

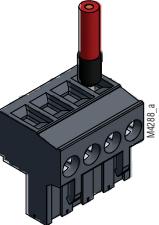

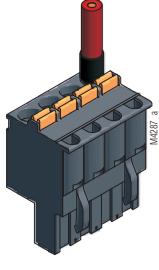

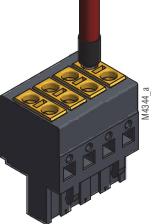

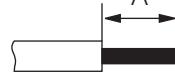

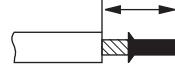

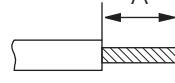

Arc limit curve under resistive load

## SAFEMASTER W Wireless Safety System Radio Controlled Safety Module (Group Controller) UH 6900

0276282

### Product Description

The radio controlled safety module UH 6900 in group mode is an innovative wireless safety system to protect man and machine. A feature of the wireless safety system is its safety-oriented uni-directional radio transmission for transmitting signals between one wireless safety module as group control device and one or more group receivers so that the two separate safety devices, each of them installed on a different machine part that is not connected to the other by wires (for example, moving machine parts), work together as one system.

Therefore SAFEMASTER W radio controlled safety modules are intended for the wireless remote control of machines and plant parts that used to be controlled by cable. Their usage is only restricted by valid safety instructions that prohibit, for example, staying under suspended loads.

The radio controlled safety module UH 6900 group controller always works together with one or more UH 6900 group receivers actuating their safety related output contacts via an uni-directional radio connection. The local output contacts of the group controller must not be used as safety contacts. They are only used for monitoring purposes.

Typical applications are:

- Hazard areas where protective equipment is necessary for the safety of persons but where wiring is impossible or not reasonable, for example in applications with extremely wide-spread, extensive hazard zones;
- Mobile and stationary plants and equipment, for example large machines, assembly halls and scaffolds, conveyor belts, high-rack warehouses, warehouses, forklifts, etc.
- The radio transmission range is up to 800 m

### Notes

Before installing, operating or maintaining this device, the user manual must be carefully read and understood on the enclosed CD.

Please note: Validation according to DIN EN ISO 13849-2 is always required for the complete system

### Your Advantages

- Higher safety in dangerous areas
- More efficiency and economy by wireless communication
- Compact, easy to install devices
- DIN rail mounting
- Removable terminal blocks
- Adjustable functions via rotary switch:
  - Cross-operation with different start modes (two-hand type IIIA and/or manual start, auto start)
- Valid for all operating modes:
  - Start function via radio with or without detection of an additional start signal at the IIR input.
- Frequency range 433 MHz or 869 MHz (license-free radio frequencies)
- Radio channel, transmitter power, and module name can be set by means of a parameterization software
- Status indicator for the devices connected via radio, by means of the parameterization software including status of radio transmission quality

### Features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508 and IEC/EN 61511
- Machine directive 2006/42/EG
- DIN EN 574: Safety of machinery - Two-hand control devices -
- DIN EN 300 220: Electromagnetic compatibility and Radio spectrum Matters (ERM) - Short Range Devices (SRD) - Radio equipment to be used in the 25 MHz to 1000 MHz frequency range with power levels ranging up to 500 mW
- Depending on the operating mode, to connect:
  - E-stop push-button (2-channel), safety gate, LC (non-contact safety system, for example light curtain) of the type 4 in accordance with EN 61 496 or the two-hand type IIIA in accordance with DIN EN 574.
  - 1 start button
  - Changeover switch (2-channel) to indicate radio use in the Safety operation with optional radio control operating mode
- For transmission via radio:
  - Safety shut-down commands
- For two-way communication via radio:
  - Signals from 8 non-safety-relevant DC 24 V inputs at 8 non-safety-relevant DC 24 V semiconductor outputs
- Broken wire and short circuit monitoring function with error indication
- Semiconductor output to indicate poor or missing radio control
- 2 semiconductor outputs for status indication
- LEDs to indicate
  - status of module
  - status of all inputs and outputs
  - the radio transmission and its quality
- Width: 45 mm

### Approvals and Markings

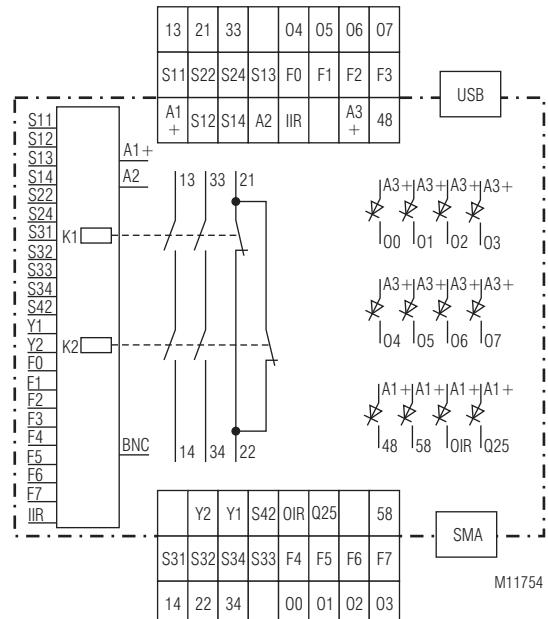

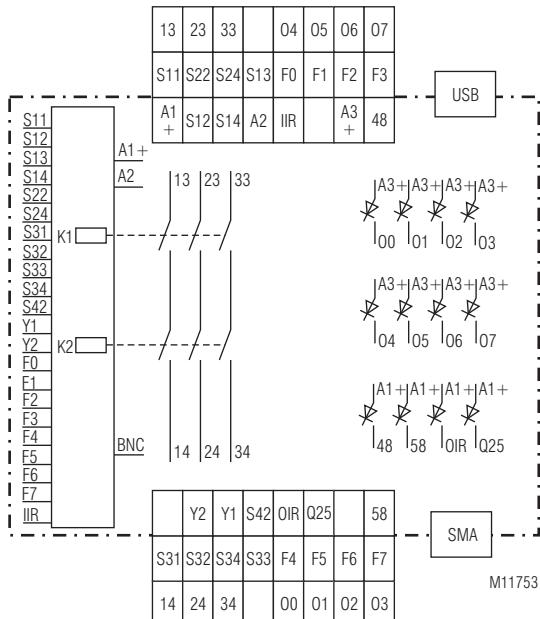

### Functions

Each UH 6900 radio controlled safety module is installed in a switch cabinet or on a mobile device and is operated with a plug-in or external antenna. It monitors the signals of up to 3 safety sensors and transmits safety related control signals via radio to the corresponding group receivers. Non-safe monitoring signals can be received via radio and switch relay or transistor outputs.

In addition, a non-contact sender and a non-contact receiver (for example, light curtain or infrared sender and receiver) may be connected to force the system to start from a specific location via radio.

## Inputs and Outputs

### Inputs

- 3 two-channel safety inputs DC 24 V
- 1 DC 24 V input for start button
- 1 feedback circuit to monitor external relays
- 1 DC 24 V input that can be used as start signal in addition to the start signal received via radio
- 8 non-safety-relevant DC 24 V functional inputs, the status of which is sent to the opposite side

### Outputs

- 3 NO contacts or 2 NO contacts + 1 NC contact (can only be used as indicator contacts)
- 1 DC 24 V semiconductor output that reproduces the start signal sent via radio as an additional start signal for the release of the safety relay on the opposite side
- 8 non-safety-relevant DC 24 V semiconductor outputs that are controlled by the opposite side
- 2 DC 24 V semiconductor outputs to display the status of the radio-controlled safety module
- 1 non-safety-relevant DC 24 V semiconductor output to indicate poor or missing radio control

## Technical Data

### Radio

Conformity:	ETS 300 220
Carrier frequency:	UHF, frequency modulated (FM)
Frequencies:	64 channels in the 433 MHz frequency band 12 channels in the 869 MHz frequency band
Frequency range (without licence):	433.1000 ... 434.6750 MHz in the 433 MHz frequency band 869.7125 ... 869.9875 MHz in the 869 MHz frequency band
Max. HF transmitter power:	10 dBm (10 mW) in the 433 MHz frequency band 7 dBm (5 mW) in the 869 MHz frequency band integrated aerial
Min. HF transmitter power:	-40 dBm (0,0001 mW)
Distance:	up to 800 m in open area*)
Aerial:	1/2 aerial, impedance 50 Ω, plug in as accessory
Sensitivity:	< -100 dBm

\*) The distance can vary with the ambient conditions of the remote control and the receiver aerial (roof construction, metal walls etc.)

### Power supply

Nominal voltage $U_N$ :	DC 24 V
Voltage range	
at max. 5% residual ripple:	0.85 ... 1.15 $U_N$
Nominal consumption:	3.6 W (Semiconductor outputs not connected)
Control voltage on S11, S13, S31, S33:	approx. DC 23 V pulses, mean value approx. 7 V at $U_N$
Control voltage on 48, 58, OIR, Q25, O0, O1, O2, O3, O4, O5, O6, O7:	approx. DC 23 V at $U_N$
Control current on S12, S14, S22, S24, S32, S34, S42, IIR, F0, F1, F2, F3, F4, F5, F6, F7:	each approx. 4 mA at $U_N$
Min. voltage for active signals on S12, S14, S22, S24, S32, S34, S42, F0, F1, F2, F3, F4, F5, F6, F7:	DC 12 V
Max. voltage for inactive signal on S12, S14, S22, S24, S32, S34, S42, F0, F1, F2, F3, F4, F5, F6, F7:	DC 4 V
Max. input voltage on S12, S14, S22, S24, S32, S34, S42, F0, F1, F2, F3, F4, F5, F6, F7:	DC 30 V
Fusing:	Internal with PTC
Max. time difference between input signals of one function	
E-stop, Light curtains, Gates:	3 s
Two-hand:	500 ms

## Technical Data

### Safety output

#### Contacts

UH 6900.03:	3 NO contacts
UH 6900.22:	2 NO contacts, 1 NC contact

The NO contacts are non safety contacts (only indicator contacts).  
**The NC contact can only be used as indicator contact!!**

Contact type: Relais, forcibly guided

#### Operating time typ. at $U_N$ :

Ready for start after power is turned on:	max. 2,5 s
automatic start:	no operating mode with automatic start

#### Operating modes

##### Full safety operation

Manual Start:	max. 1 s <sup>1)</sup>
automatic restart:	max. 1,1 s <sup>1)</sup>

##### Cross-operation

Manual Start:	max. 650 ms <sup>1)</sup>
automatic restart:	max. 650 ms <sup>1)</sup>

##### Safety operation with optional radio control

##### S32, S34 supplied with power:

Manual Start:	max. 70 ms
automatic restart:	max. 80 ms

##### S32, S34 not supplied with power:

Reset through S42 (after reset on control device):	max. 70 ms
Reset through S42 on control device:	max. 700 ms <sup>1)</sup>
Reset through auto start on control device:	max. 700 ms <sup>1)</sup>

<sup>1)</sup> For the start options with additional detection of the IIR input, the delay time of the safety element connected to this input must be added to the pick-up times

#### Switching off time (reaction time)

S12-S14, S22-S24, S32-S34: max. 30 ms

Disconnection with active radio signal (S12-S14, S22-S24, S32-S34 of 2 <sup>nd</sup> device):	max. 200 ms
Passive disconnection because of interrupted radio signal:	max. 500 ms

Nominal output voltage:	max. AC 250 V
DC: see limit curve for arc-free operation	

#### Switching of low loads

Min. switching voltage:

Min. switching current:

Min. switching capacity:

#### Thermal current $I_{th}$ :

> 5 V

> 5 mA

> 25 mW

max. 5 A per contact

see quadratic total current limit curve

#### Switching capacity to AC 15:

NO contacts:

NC contacts:

to DC 13:

to DC 13 at 0.1 Hz:

Electrical life to AC 15 at 2 A, AC 230 V:

IEC/EN 60 947-5-1

1 A / AC 230 V IEC/EN 60 947-5-1

2 A / DC 24 V IEC/EN 60 947-5-1

8 A / DC 24 V IEC/EN 60 947-5-1

$10^5$  switching cycles

Permissible switching frequency: max. 1 200 switching cycles / h

#### Short circuit strength

max. fuse rating:

6 A gG / gL

IEC/EN 60 947-5-1

Mechanical life:  $10 \times 10^6$  switching cycles

## SAFEMASTER W Wireless Safety System Radio Controlled Safety Module (Group Receiver) UH 6900

0276283

### Product Description

The radio controlled safety module UH 6900 in group mode is an innovative wireless safety system to protect man and machine. A feature of the wireless safety system is its safety-oriented uni-directional radio transmission for transmitting signals between one wireless safety module as group control device and one or more group receivers so that the two separate safety devices, each of them installed on a different machine part that is not connected to the other by wires (for example, moving machine parts), work together as one system.

Therefore SAFEMASTER W radio controlled safety modules are intended for the wireless remote control of machines and plant parts that used to be controlled by cable. Their usage is only restricted by valid safety instructions that prohibit, for example, staying under suspended loads.

The radio controlled safety module UH 6900 group receiver always works together with a UH 6900 group control device. The safety related output contacts are either controlled via radio from the group controller or by local e-stop systems.

Typical applications are:

- Hazard areas where protective equipment is necessary for the safety of persons but where wiring is impossible or not reasonable, for example in applications with extremely wide-spread, extensive hazard zones;
- Mobile and stationary plants and equipment, for example large machines, assembly halls and scaffolds, conveyor belts, high-rack warehouses, warehouses, forklifts, etc.
- The radio transmission range is up to 800 m

### Notes

Before installing, operating or maintaining this device, the user manual must be carefully read and understood on the enclosed CD.

Please note: Validation according to DIN EN ISO 13849-2 is always required for the complete system

### Your Advantages

- Higher safety in dangerous areas
- More efficiency and economy by wireless communication
- Compact, easy to install devices
- DIN rail mounting
- Removable terminal blocks
- Adjustable functions via rotary switch:
  - Cross-operation with different start modes (two-hand type IIIA and/or manual start, auto start)
- Valid for all operating modes:
  - Start function via radio with or without detection of an additional start signal at the IIR input.
- Frequency range 433 MHz or 869 MHz (license-free radio frequencies)
- Radio channel, transmitter power, and module name can be set by means of a parameterization software
- Status indicator for the devices connected via radio, by means of the parameterization software including status of radio transmission quality

### Features

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL) 3 to IEC/EN 61508 and IEC/EN 61511
- Machine directive 2006/42/EG
- DIN EN 574: Safety of machinery - Two-hand control devices -
- DIN EN 300 220: Electromagnetic compatibility and Radio spectrum Matters (ERM) - Short Range Devices (SRD) - Radio equipment to be used in the 25 MHz to 1000 MHz frequency range with power levels ranging up to 500 mW
- Depending on the operating mode, to connect:
  - E-stop push-button (2-channel), safety gate, LC (non-contact safety system, for example light curtain) of the type 4 in accordance with EN 61 496 or the two-hand type IIIA in accordance with DIN EN 574.
  - 1 start button
  - Changeover switch (2-channel) to indicate radio use in the Safety operation with optional radio control operating mode
- For receiving via radio:
  - Safety shut-down commands
- For two-way communication via radio:
  - Signals from 8 non-safety-relevant DC 24 V inputs at 8 non-safety-relevant DC 24 V semiconductor outputs
- Broken wire and short circuit monitoring function with error indication
- Semiconductor output to indicate poor or missing radio control
- 2 semiconductor outputs for status indication
- LEDs to indicate
  - status of module
  - status of all inputs and outputs
  - the radio transmission and its quality
- Width: 45 mm

### Approvals and Markings

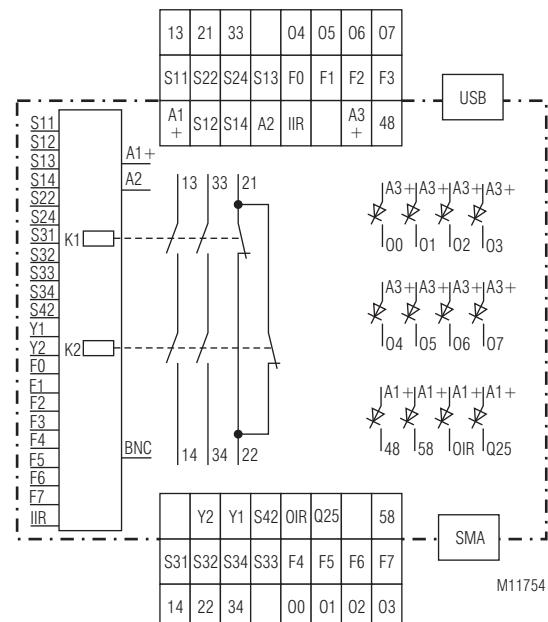

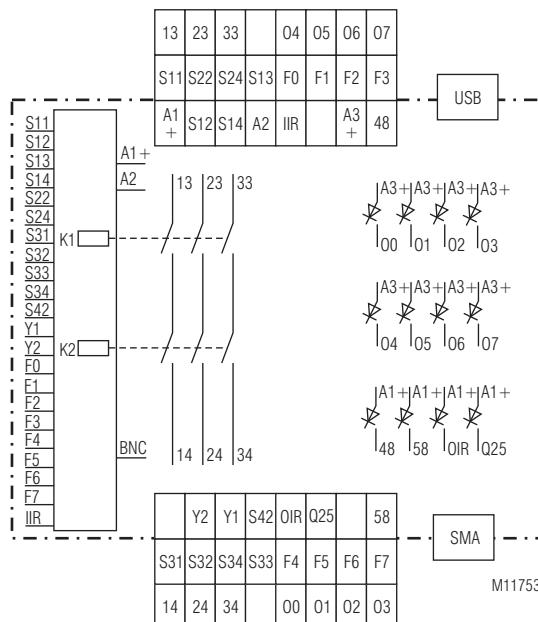

### Functions

Each UH 6900 radio controlled safety module is installed in a switch cabinet or on a mobile device and is operated with a plug-in or external antenna. It detects the signals of up to three wired safety elements plus the signals from the related active group controller that are sent through a safe radio transmission. Safety-relevant switching commands are switched by relay outputs, non-safety-relevant control signals through semiconductor outputs.

In addition, a non-contact sender and a non-contact receiver (for example, light curtain or infrared sender and receiver) may be connected to force the system to start from a specific location via radio.

## Circuit Diagrams

## Connection Terminals

Terminal designation	Signal description
A1+	DC 24 V supply voltage for radio controlled safety module
A2	Common earth
48/58	Non-safety DC 24 V semiconductor outputs: State of radio controlled safety module
S11, S31	Test outputs for short circuit detection of the safety inputs Sx2
S13, S33	Test outputs for short circuit detection of the safety inputs Sx4
S12, S14	Inputs of the two-channel safety input 1
S22, S24	Inputs of the two-channel safety input 2
S32, S34	Inputs of the two-channel safety input 3
S42	Input for hard-wired start button
Y1/Y2	Input for feedback loop of external contact reinforcement
13/14	1 <sup>st</sup> safety output, safety NO contact
23/24 or 21/22	2 <sup>nd</sup> safety output, safety NO contact monitoring output (NC contact)
33/34	3 <sup>rd</sup> safety output, safety NO contact
IIR	Input for enabling the received start signal
OIR	Output with image of sent start signal
Q25	Output for input signal quality < -80 dBm
F0 to F7	Non-safety function inputs
O0 to O7	Non-safety DC 24 V function outputs
A3+	DC 24 V power supply of the function outputs O0 to O7

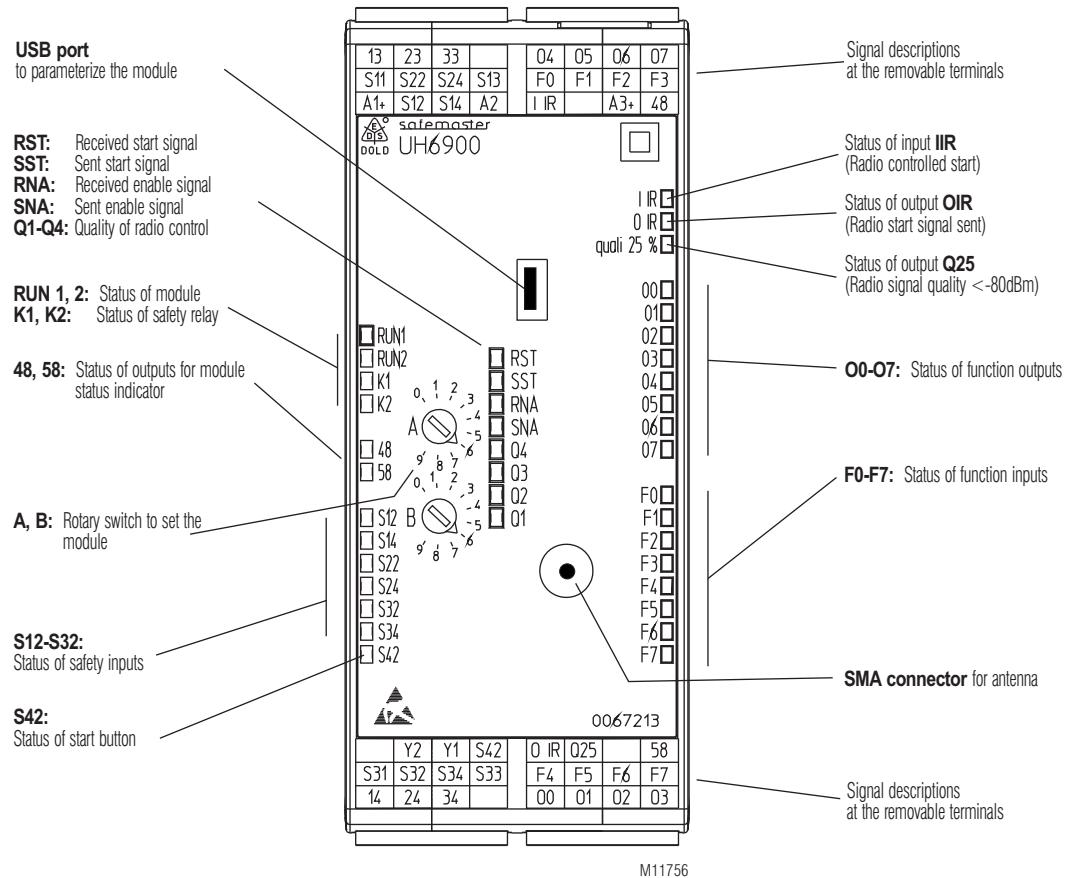

## Inputs and Outputs

### Inputs

- 3 two-channel safety inputs DC 24 V
- 1 DC 24 V input for start button
- 1 feedback circuit to monitor external relays
- 1 DC 24 V input that can be used as start signal in addition to the start signal received via radio
- 8 non-safety-relevant DC 24 V functional inputs, the status of which is sent to the opposite side

### Outputs

- 3 safety-relevant NO contacts or 2 safety-relevant NO contacts + 1 NC contact (can only be used as an indicator contact)
- 1 DC 24 V semiconductor output that reproduces the start signal sent via radio as an additional start signal for the release of the safety relay on the opposite side
- 8 non-safety-relevant DC 24 V semiconductor outputs that are controlled by the opposite side
- 2 DC 24 V semiconductor outputs to display the status of the radio-controlled safety module
- 1 non-safety-relevant DC 24 V semiconductor output to indicate poor or missing radio control

... Wireless escort for your safety

- For access in hazardous areas with enabling switch
- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1: 2008
  - Safety Integrity Level (SIL 3) to IEC/EN 61508
  - Cat. 4 acc. to EN 954-1
  - Acc. to DIN EN ISO 13850
  - Safety radio transmission

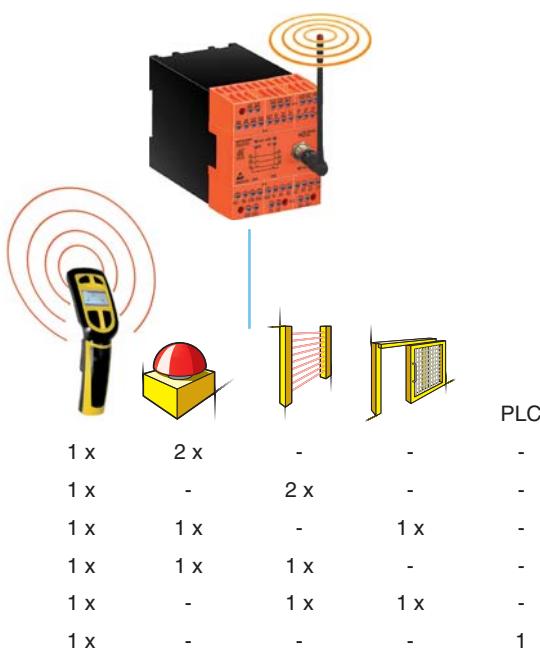

### Your Advantages

- Maximum mobility and flexibility with maximum safety
- For higher availability of your machines and plants
- Ideal solutions for mobile and stationary machines and plants with dangerous areas
  - During automatic operation e. g. to clear failures
  - During set up e. g. to adjust machine parameters, maintenance, set up
- Optimised sight on operating area during set up
- Individually configurable control buttons for up to 20 control functions
- Comfortable one-hand operation
- Clearly arranged control panel with clearly legible display
- Fast frequency adjustment directly on the enabling switch
- High operational reliability due to dynamic and redundant data transmission protocol

### Approvals and Markings

### Options for Control

### Additional Information About This Topic

- You will find information about the radio controlled safety module in the datasheet BI 6910
- You will find information about the remote control in the datasheet RE 6910

### Applications

- Setup and maintenance of robot cells
- Interventions in machine areas during setup operation
- Maintenance of dangerous machines
- Manual intervention in automated production processes
- Maintenance of automatic warehouses
- For all applications with access options in hazardous areas

### Also for control tasks, e. g. for:

- Gradual regulation
- Start and stop functions
- Speed adjustments
- Positioning and selection of actuators

### Description

SAFEMASTER W includes a very compact and ergonomic enabling switch RE 6910 and a safety module with radio control BI 6910. The enabling switch provides personal protection when entering dangerous areas and allows besides the emergency stop function also control functions with the integrated push buttons and switches. The safety outputs of the BI 6910 guarantee safe disconnection. For control functions it includes 7 semiconductor outputs.

#### Radio controlled enabling switch RE 6910

The radio controlled enabling switch RE 6910 includes a LCD display to indicate the function settings as well as over 4 function buttons for radio remote control. It does not replace conventional safety circuits, but offers additional features. I.e. wired safety circuits remain active, although a remote control is used.

#### Radio Controlled Safety Module BI 6910

The radio safety module BI 6910 reacts on the signals of the corresponding enabling switch and the wired safety components. To detect the corresponding enabling switch frequency and identity code must be identical.

#### Infrared Module RE 5910/060

If the start of a plant must only be possible from a certain area, e.g. to have a view on the dangerous zone, the option with infrared start is the ideal solution. Accidents can be avoided by starting from defined zones.

#### Charger Station RE 6910/010

If the enabling switch is not used it has to be placed in the charger and switched off. This starts the charging process for the battery. The charger has 2 monitoring contacts. These are used to detect the removal of the enabling switch.

#### Aerials

The receiver unit requires an aerial that can be mounted directly on the front of BI 6910. If the receiver is mounted in a metal enclosure the aerial has to be placed outside. For the outside mounting a special coaxial cable is available.

- According to
    - Performance Level (PL) e and category 4 to EN ISO 13849-1: 2008
    - Safety Integrity Level (SIL 3) to IEC/EN 61508
  - Safety radio transmission
  - Radio receiver for:
    - Radio controlled enabling switch
    - Control signals for 6 non-safety semiconductor outputs
  - Multifunction safety modul with additional control input to connect:
    - E-stop pushbutton (2-channel), safety gate or LC type 4 according to EN 61496
    - 1 Start button
    - 1 or 2 monitoring contacts to signal the use of radio
  - Adjustable functions with step switch for:
    - Manual start or automatic start
    - when removing the enabling switch from the charger (open control contact) manual start is possible by enabling switch
    - possibility of disabling the access protection (gate) with active enabling switch
  - Broken wire and short circuit monitoring with error indication
  - Feedback circuit Y1/Y2 for monitoring of external contactors
  - 2 semiconductor outputs for status indication
  - LEDs for status indication
  - Easy connection
  - DIN rail mounting
  - Removable terminal blocks allow fast exchange of module
  - Also as input modul for multifunction, modular safety system SAFEMASTER M available
  - Compact unit, only 67.5 mm width

## Circuit Diagrams

BI 6910.03/00MF9

BI 6910.22/00MF9

## Indication for Enabling Switch

The BI 6910 is equipped with a safety radio receiver to operate the signals from a enabling switch. It has 1 or 2 inputs depending on the operation mode (S31-S32and S33-S34) to connect the indication contacts of a battery charger for the remote control.

## Aerial Connection

The radio connection of the radio controlled safety module to the reenabling switch is made via an aerial that is mounted directly on the front of the BI 6910. If the unit is built into a metal cabinet the aerial has to be mounted outside. The connection is made via DOLD coax cable (e.g. RE 5910/042; Article number: 0059653). Special functions like activity monitoring and selection of radio frequency can be adjusted on the enabling switch.

## Indications

green LEDs K1 and K2:	on when safety relay activated
green LED reception:	on at radio receive
yellow LEDs run 1, run 2 and outputs 48 and 58:	indicate the actual status of the modul
red LED receiver error:	indicate errors on radio-receiver

## ! Notes

**A machine must only be started from a location from which one can see that no person is present in the dangerous area.**

To solve this there are 2 variants of the BI 5910:

### BI 6910.../00MF9

This unit is used in applications where start is only possible from a hard-wired start button.

### BI 6910.../01MF9

This unit has in addition to the radio control also an infrared function. The reset of the enabling switch is only accepted if the reset signal is received via radio and via infrared. This means that the enabling switch must be pointed at the infrared receiver for reset.

## Technical Data

### Safety Output

#### Contacts

BI 6910.03:	3 NO contacts

## Approvals and Markings

## Technical Data

### Radio

Conformity:	ETS 300 220
Carrier frequency:	UHF, frequency modulated (FM)
Frequency:	64 (transmitting power 1mW) or 25 (transmitting power 10mW)
Frequency range:	433.100 ... 434.675 MHz or 434.075 ... 434.675 MHz
HF-power: integrated aerial distance*):	< 10 mW (without licence), approx. 150- 200 m under industrial ambient conditions *) approx. 600 m in open area

\*) The distance can vary with the ambient conditions of the enabling switch and the receiver aerial (roof construction, metal walls etc.)

### Battery

Type:	Lithium-ion
Service life:	min. 500 cycles (charge/discharge cycles)
Charging time:	2 h, bei +20°C (80%) (for completely discharged battery)
Full charging time:	2 h 30 min (100%)

### Charge capacity

- Normal operation of push buttons:	40 h, at 50% operation and + 20°C
- after 10 minutes charging of discharged battery:	approx. 1 h
The charge capacity of the enabling switch is depending on operation conditions (continuously or temporary utilization, ambient temperature e.g.)	
Storage temperature:	-20°C ... +45°C
Charging temperature:	0°C ... +35°C

**Attention!** Slow charging outside temperature range may damage the battery

### Enclosure

Material:	ABS
Degree of protection:	IP 54
Ambient temperature:	-20°C ... +50°C
Storage temperature:	-20°C ... +45°C
Holder for non-operation:	Charger unit
Weight (with battery):	340 g

### Approvals and Markings

### Options for Control

1x	2 x	-	-
1x	-	2 x	-
1x	1 x	-	1 x
1 x	1 x	1 x	-
1 x	-	1 x	1 x

... Wireless escort for your safety

- For E-Stop and control functions
- According to EN 13849 PL e, safety category 4 to EN 954-1
- According to DIN EN ISO 13850
- Safety radio transmission

### Your Advantages

- For higher availability of your machines and plants
- Ideal solutions for mobile and stationary machines and plants with dangerous areas
  - during automatic operation e. g. to clear failures
  - during set up e. g. to adjust machine parameters, maintenance, set up
- SAFEMASTER W offers as wireless system all advantages of radio control e.g.:
  - Higher availability of machines because damage of trailing cables is avoided
  - Higher mobility of the operator by easy moving around with wireless control
  - Cost saving by replacing wire bound operating panels
  - Less mounting, installation and wiring time
  - No wearing on trailing cables, slip rings etc.
  - Easy retrofit and modernising of machines
  - Higher flexibility
  - Excellent ergonomics
- Optimised sight on operating area during set up
- Easy grouping of different production machines with common e-stop and separate or common start
- User legitimating with electronic key on remote control possible

### Additional Information About This Topic

- You will find information about the radio controlled safety module in the datasheet BI 5910
- You will find information about the remote control in the datasheet RE 5910
- You will find information about SAFEMASTER M in the separate catalogue „system description SAFEMASTER M“

### Applications of SAFEMASTER W

#### E-Stop

Protection of men and machines in mobile and large plants where a fixed wiring is not possible, e.g. production halls, mounting scaffolds, plants and dangerous accessible areas.

#### Also for control functions for e. g. :

- Step control
- Start-stop functions
- Speed adjustment
- Positioning and actuator selection

### Description

SAFEMASTER W includes a very compact and ergonomic remote control RE 5910 and a safety module with radio control BI 5910. The remote control provides personal protection when entering dangerous areas and allows besides the emergency stop function also control functions with the integrated push buttons and switches. The safety outputs of the BI 5910 guarantee safe disconnection. For control functions it includes 7 semiconductor outputs.

### Remote Control RE 5910

The remote control includes 1 e-stop and 1 start button as well as 4 function buttons for radio remote control. It does not replace conventional safety circuits, but offers additional features. I.e. wired safety circuits remain active, although a remote control is used.

### Electronic Key for Remote Control

The electronic key enables the activation of the remote control and offers personal access permission to a certain configuration of the remote control. It contains the following information:

- frequency that is used for transmission
- Identity code of the system
- Time interval for activity monitoring
- Configuration of function keys

### Radio Controlled Safety Module BI 5910

The radio safety module reacts on the signals of the corresponding remote control and the wired safety components. To detect the corresponding remote control frequency and identity code must be identical.

### Infrared Module RE 5910/060

If the start of a plant must only be possible from a certain area, e.g. to have a view on the dangerous zone, the option with infrared start is the ideal solution. Accidents can be avoided by starting from defined zones.

### Charger Station RE 5910/010

If the remote control is not used it has to be placed in the charger and switched off. This starts the charging process for the battery. The charger has 2 monitoring contacts. These are used to detect the removal of the remote control.

### Aerials

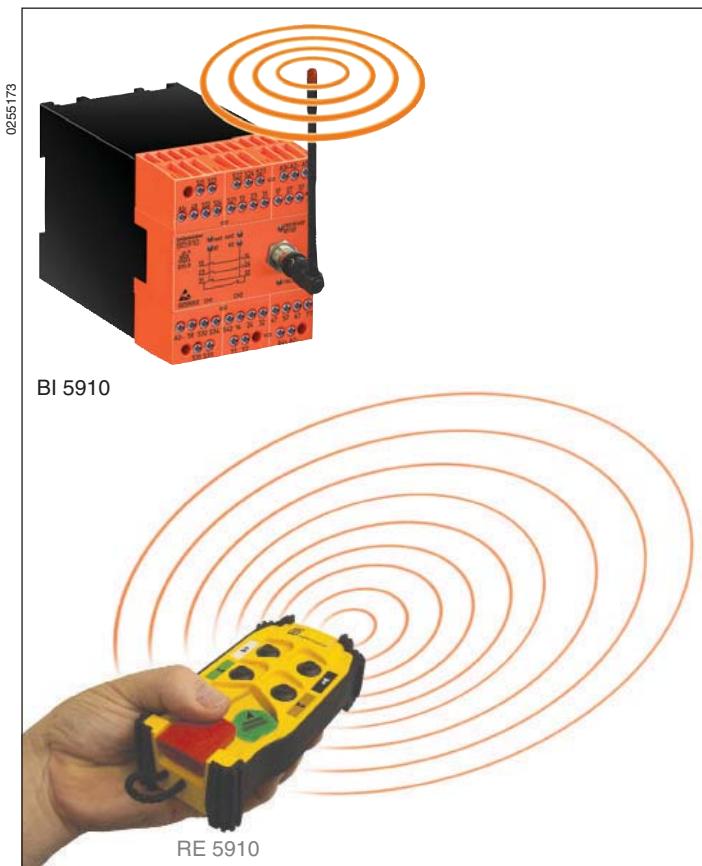

The receiver unit requires an aerial that can be mounted directly on the front of BI 5910. If the receiver is mounted in a metal enclosure the aerial has to be placed outside. For the outside mounting a special coaxial cable is available.

see datasheet RE 5910

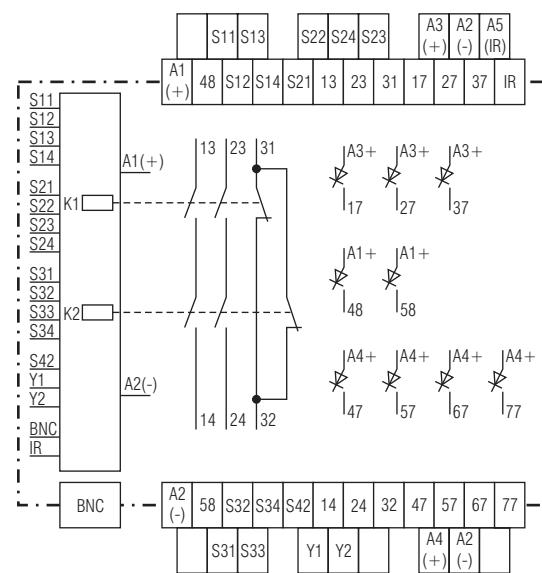

## Approvals and Markings

## Circuit Diagrams

BI 5910.03/00MF9

BI 5910.22/00MF9

## Indication for Remote Control

The device is equipped with a safety radio receiver to operate the signals from a remote control with remote e-stop. It has 1 or 2 inputs depending on the operation mode (S31-S32 and S33-S34) to connect the indication contacts of a battery charger for the remote control.

## Aerial Connection

The radio connection of the radio controlled safety module to the remote control is made via an aerial that is mounted directly on the front of the BI 5910. If the unit is built into a metal cabinet the aerial has to be mounted outside. The connection is made via DOLD coax cable (e.g. RE 5910/042; Article number: 0059653). Special functions like activity monitoring and selection of radio frequency can be adjusted on the remote control.

## Indications

green LEDs K1 and K2:	on when safety relay activated
green LED reception:	on at radio receive
yellow LEDs run 1, run 2 and outputs 48 and 58:	indicate the actual status of the modul
red LED receiver error:	indicate errors on radio-receiver

## Notes

**A machine must only be started from a location from which one can see that no person is present in the dangerous area.**

To solve this there are 2 variants of the BI 5910:

### BI 5910.../00MF9

This unit is used in applications where start is only possible from a hard-wired start button.

### BI 5910.../01MF9

This unit has in addition to the radio control also an infrared function. The reset of the remotecontrol is only accepted if the reset signal is received via radio and via infrared. This meansthat the remote control must be pointed at the infrared receiver for reset.

E-stop (Radio):	max. 170 ms

Passive disconnection because of interrupted radio signal:

Disconnection with active radio signal and closed charge control contact:

#### Nominal output voltage:

Switching of low loads:	max. 1 s
<b>Thermal current <math>I_{th}</math>:</b>	AC 250 V
<b>Switching capacity</b>	DC: see limit curve for arc-free operation > 100 mV

to AC 15

NO contacts:	AC 3 A /230 V	IEC/EN 60 947-5-1
NC contacts:	AC 2 A /230 V	IEC/EN 60 947-5-1
to DC 13:	DC 8 A / 24V at 0.1Hz	IEC/EN 60 947-5-1

#### Electrical life

to AC 15 at 2 A, AC 230 V: 100000 switching cycles IEC/EN 60 947-5-1

#### Permissible switching frequency:

max. 1200 switching cycles / h

Short circuit strength

Max. fuse rating:	6 A gL	IEC/EN 60 947-5-1
Line circuit breaker:	C 8 A	
Mechanical life:	10 x 10 <sup>6</sup> switching cycles	

## Semiconductor outputs

### Outputs

(terminals 48, 58, 17, 27, 37, 47, 57, 67, 77):	transistor outputs, switching +
<b>Nominal output voltage (A3+, A4+):</b>	DC 24 V
Nom. output voltage at $U_N$ :	min. DC 23 V, max. 100 mA cont. current max. 400 mA für 0.5 s internal short circuit, over temperature and overload protection
Min. operating current:	min. 0.5 mA
Residual current:	min. 0.1 mA

## General Data

### Operating mode:

Continuous operation

### Temperature range

0 ... 50 °C

storage : - 25 ... + 85 °C

altitude: < 2.000 m

### Clearance and creepage distance

rated impulse voltage / pollution degree: 4 kV / 2 (basis insulation) IEC 60 664-1

### EMC

HF-irradiation: 10 V / m IEC/EN 61 000-4-3

Fast transients

on wires for power supply A1-A2: 2 kV IEC/EN 61 000-4-4

on signal and control wires: 2 kV IEC/EN 61 000-4-4

Surge voltages

between wires for power supply 1 kV IEC/EN 61 000-4-5

between wire and ground: 2 kV IEC/EN 61 000-4-5

HF- wire guided: 10 V IEC/EN 61 000-4-6

Interference suppression: Limit value class B EN 55 011

acc. to EN 61 496-1 (1997) the unit has to be mounted in a control cabinet with protection class 54

Housing: IP 40 IEC/EN 60 529

Terminals: IP 20 IEC/EN 60 529

**Enclosure:** Thermoplastic with V0 behaviour according to UL subject 94

## Technical Data

<b>Vibration resistance:</b>	according to EN 61496-1 (1997) Amplitude 0.35 mm IEC/EN 60 068-2-6 Frequency 10 ... 55 Hz
<b>Shock proof</b>	
Acceleration:	10 g
Impulse length:	16 ms
Number of shocks:	1000 per axis on all 3 axes
<b>Climate resistance:</b>	0 / 050 / 04 IEC/EN 60068-1
<b>Terminal designation:</b>	EN 50 005

## SAFEMASTER Valve Monitoring Module BH 5904.02/00MF2

**DOLD** 

0241405

### Block Diagrams

### Indicators

- green LED's K1, K2: On, when relays K1 and K2 are energized.  
yellow LED run 1: On continuously, when no fault and the valve is in initial position.  
Off, when no fault and the valve is in end position.  
Indicates faults by different flashing sequences (see flashing codes for fault indication).  
yellow run 2: On continuously, when no fault.  
Indicates internal faults by different flashing sequences (see flashing codes for fault indication).

Output  
48 and 58:

48	58	
+24Volt	+24Volt	No fault or feed back circuit open
0 Volt	0 Volt	Other fault than valve failure or feed back circuit open
+24Volt	0 Volt	Starting failure of valve
0 Volt	+24Volt	Reset failure of valve

- According to
  - Performance Level (PL) e and category 4 to EN ISO 13849-1: 2008
  - SIL Claimed Level (SIL CL) 3 to IEC/EN 62061
  - Safety Integrity Level (SIL 3) to IEC/EN 61508
  - Category 4 to EN 954-1
- Way of valve monitoring adjustable (2 NC, 2NO, 1 changeover contact)
- Reset button to acknowledge after fault detection
- Available with continuous monitoring of the valve or just with one check per cycle
- Contact reinforcement by external contactors possible
- Short circuit and cross fault detection
- Broken wire detection
- Outputs: 2 NO contacts
- 2 semiconductor outputs with short circuit, overload and temperature protection to monitor the status
- Under and overvoltage detection
- Reaction time: max. 28 ms
- LED operation indicators (run 1, run 2)
- Width 45 mm

### Approvals and Markings

\* see variants

### Applications

- Protection of people and machines.  
The module BH 5904 monitors the positions of valve lifter in standard hydraulic blocks for presses.

### Function

The module BH 5904 monitors the position of the valve at the beginning of a machine cycle by checking a position sensor. The output contacts are only activated if on start signal from the safety controller the valve is in its initial position, the feed back circuit from the safety controller is closed and no fault is stored.

The output contacts are deactivated or cannot be activated again, when after an adjustable time delay the valve position does not correspond to the start signal.

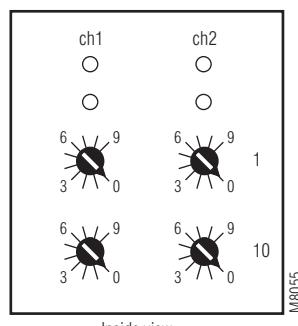

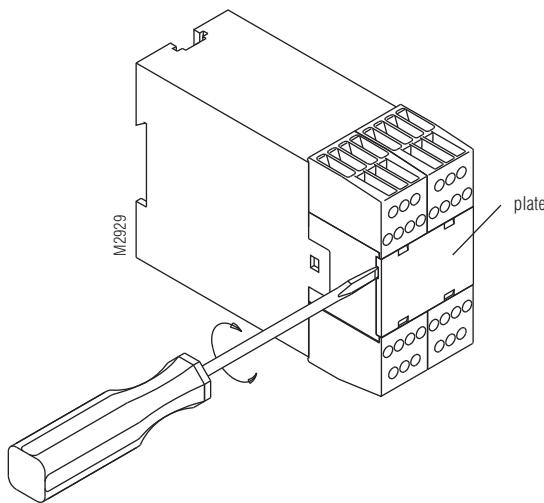

Two types of machine cycles can be selected:

- The cycle ends when feed back circuit of the safety controller is interrupted. The valve will only be monitored when switching the start signal for the first time.
- The cycle ends when switching off the start signal by the safety controller. In this case the valve will be monitored continuously.  
Because of the potential free inputs it is possible to connect as many modules BH 5904 as required, which monitor different valves to the same feed back circuit.

### Notes

- Adjustments on the unit may only be carried out by qualified specialist staff when the unit is disconnected from the supply.
- Before removing the front plate of the unit potential equalisation must be made.
- The module is a passive monitoring device which does not start any dangerous movement. It prevents against dangerous movement together with the safety controller it when it detects a failure in its monitoring area. The safety controller therefore has to have a feed back circuit.

## Setting

Inside view

The setting of the function of the BH 5904 is done with 4 rotational switches located behind the front plate shown in the picture. The switches on the left select the function on processor 1 and the switches on the right of processor 2. For both processors the setting must be the same.

### Example for setup:

Function to be selected: status sensor on valve is C/O contact, 1 valve test per machine cycle, max. 1 s.

Set both upper switches to 5

Set both lower switches to 1

	Time in which the valve has to react									
SW 1	0	1	2	3	4	5	6	7	8	9
(s)	0,5	0,61	0,72	0,83	0,94	1,05	1,16	1,27	1,38	1,49

SW. 10 :	Selection of operating mode										
	Valve status sensor	Valve monitoring mode				Contact reinforcement					
0	S21-S22 : NC, S23-S24: NC	1 test per machine cyclic						Without contact reinforcement			
1	S21-S22 : NO, S23-S24: NC										
2	S21-S22 : NO, S23-S24: NO										
3	S21-S22 : NC, S23-S24: NC										
4	S21-S22 : NO, S23-S24: NC										
5	S21-S22 : NO, S23-S24: NO										
6	S21-S22 : NC, S23-S24: NC							With contact reinforcement			
7	S21-S22 : NO, S23-S24: NC										
8	S21-S22 : NO, S23-S24: NO										
9	not allowed										

## Operation Modes

At the beginning of a machine cycle the following conditions for the initial state of the module have to be fulfilled, before the start signal of the safety controller can activate the relays K1 and K2:

- The feed back circuit of the safety controller must be closed.
- The starting signal must be inactive.
- At the end of the previous cycle the valve has to have returned to its initial position within the required time.
- The module must not show any stored fault.

The relays K1 and K2 are activated with the positive edge of the starting signal of the controller.

The relay de-energise and the module locks out if the valve has not reached its end position in the required maximum time or if the starting signal is switched off before the valve has reached its end position. The momentary state of the valve is indicated by the LED run 1.

A started cycle is finished in all operating modes by interrupting the feed back circuit.

### Reset button

A reset button can be connected to terminals S33-S34 to reset the module without disconnecting the supply voltage.

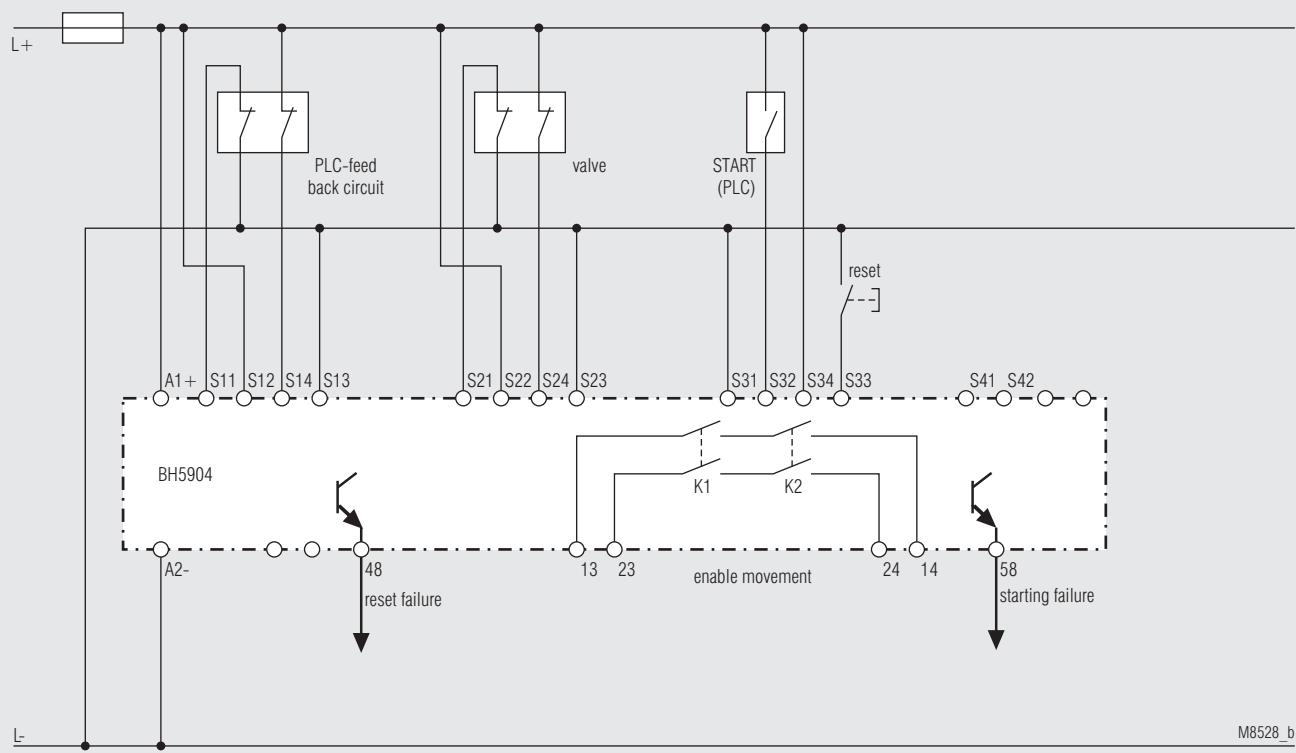

The reset requires pressing and releasing of the push button and all other signals to be in initial state. Reset is only made if the push button is not longer activated than 3 seconds.

### Contact reinforcement

If more contacts are needed or higher currents have to be switched then the unit can handle on K1, K2, the feed back contacts of external contactors can be connected to terminals S41-S42 (2 NC contacts, see pic. 2), which signal the status of these contactors to the BH 5904. The BH 5904 monitors continuously if this input corresponds to the state of K1 and K2. On failure (more than 100 ms after switching K1 and K2 no equivalent status) K1 and K2 disconnect or do not energise at all. The module BH 5904 can only be reset after removing of the failure by pressing the reset button. Contact reinforcement is only available with functions having continuous valve monitoring (switch 10 = 6, 7 and 8).

If contact reinforcement is not used, terminals S41-S42 remain open.

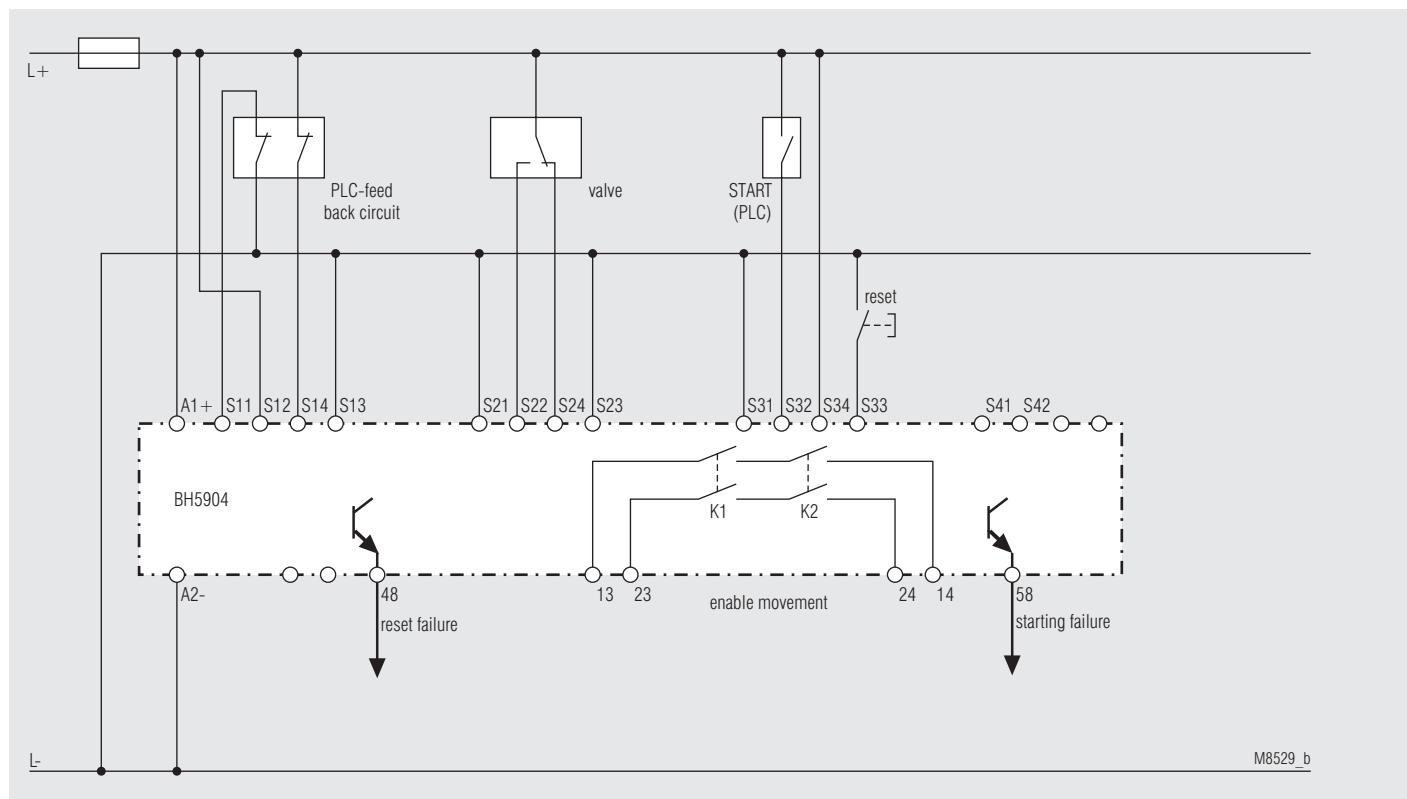

## Application Examples

M8528\_b

Pic.: 1

Connection without contact reinforcement of contacts, valve sensor 2 NC contacts (same connection as for 2 NO contacts)  
(switch 10: position 0, 2, 3 or 5)

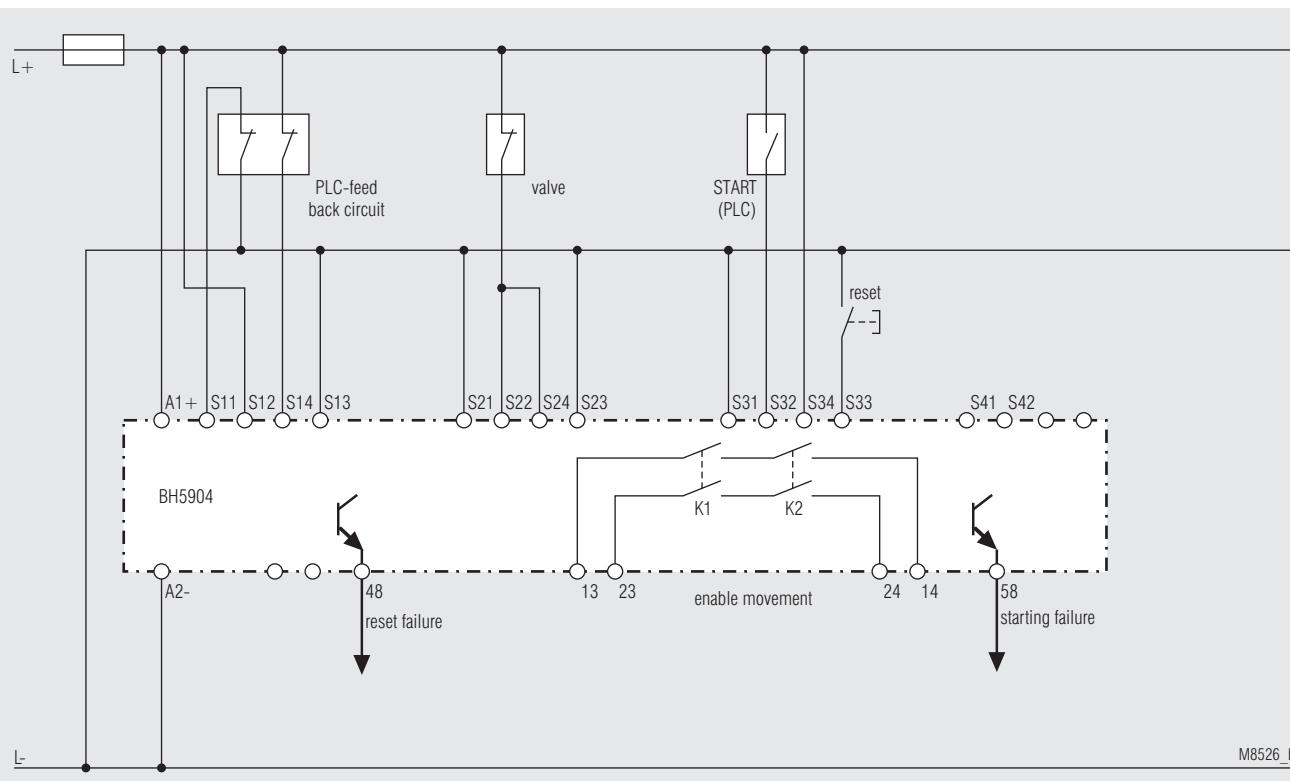

M8529\_b

Pic.: 2

Connection without contact reinforcement of contacts, valve sensor 1 changeover contact (switch 10: position 1, 4 or 7)

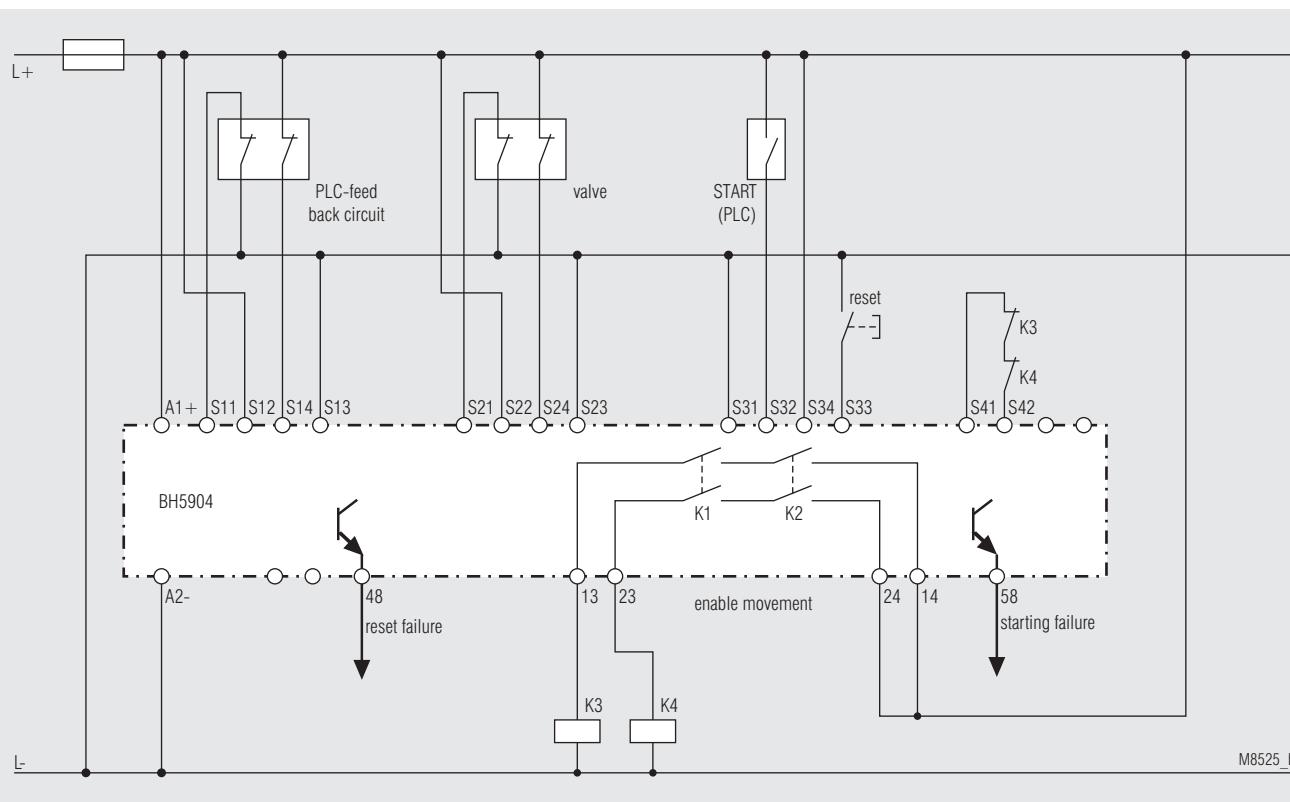

## Application Examples

M8526\_b

Pic.: 3

Connection without contact reinforcement of contacts, valve sensor 1 NC contact (same connection as for 1 NO contact)  
(switch 10: position 0, 2, 3 or 5)

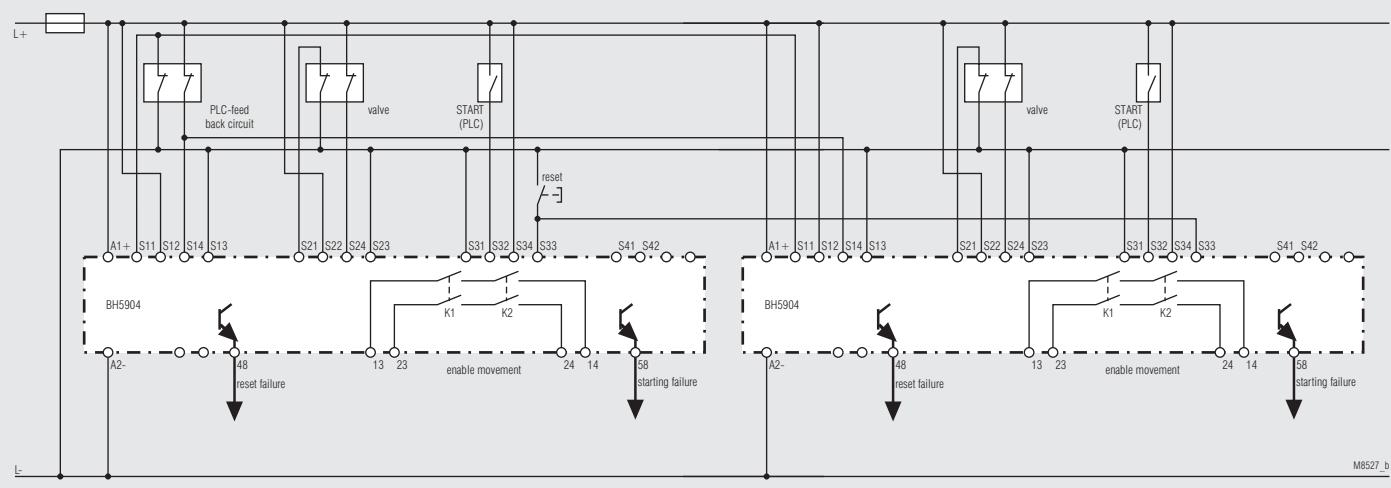

M8525\_b

Pic.: 4

Connection with contact reinforcement of contacts (switch 10: position 6)  
(when using 2 NO contacts (switch 10: position 8) or 1 changeover contact (switch 10: position 7) the connection of contact reinforcement is identically)

## Application Example

Pic.: 5

Connection when several modules are connected to one feed back circuit and one reset button.

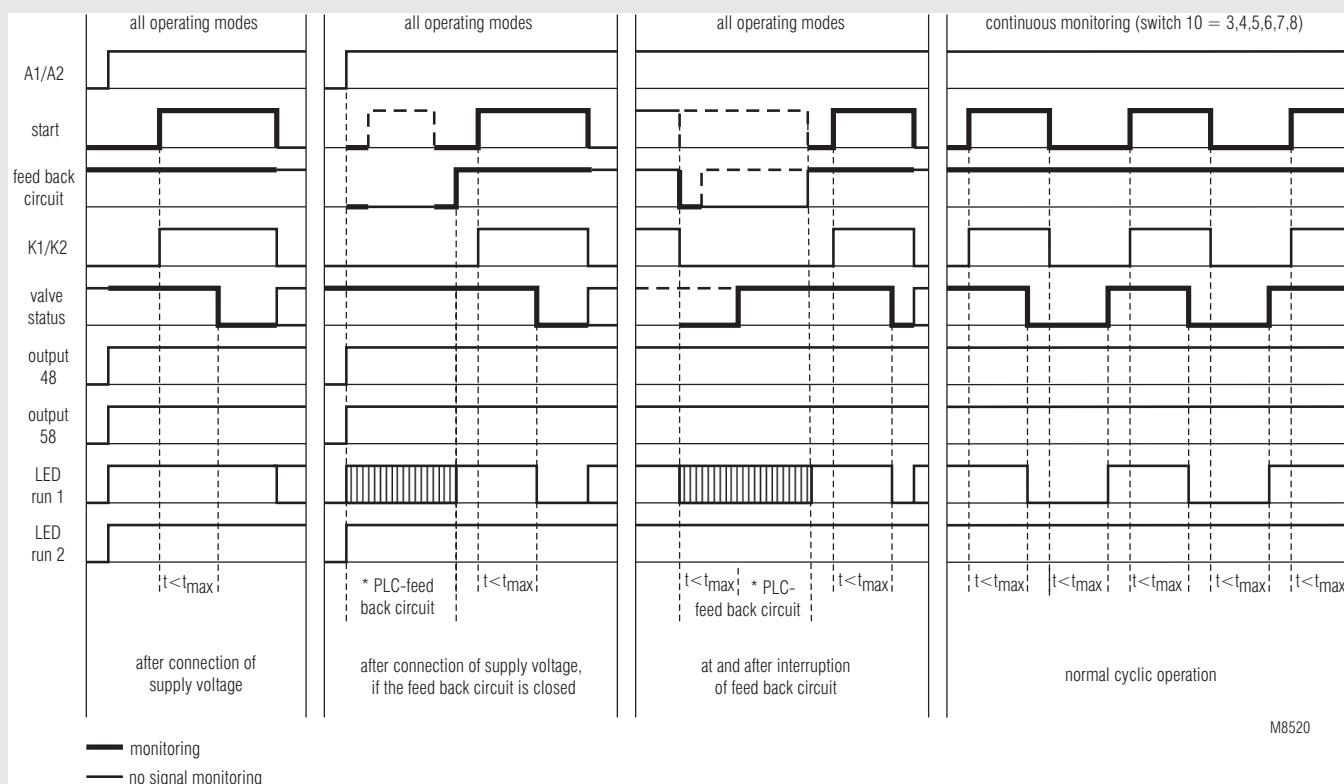

### Operation Modes

The valves are continuously monitored, and failures are only during test cycles indicated by the semiconductor outputs 48 (release failure) and 58 (starting failure). In the following cases the relays K1 and K2 are de-energized or do not energise at all:

- If all signals except feed back circuit are not in initial state when auxiliary supply is connected.
- If at the beginning of a machine cycle after the first activation by the starting signal the valve does not reach the end state within adjusted time. With the first activation the starting signal has to stay so long that the end position can be indicated.
- If at the beginning of a machine cycle after the first activation by the starting signal the valve does reach the end position and leaves this position before the starting signal gets inactive.

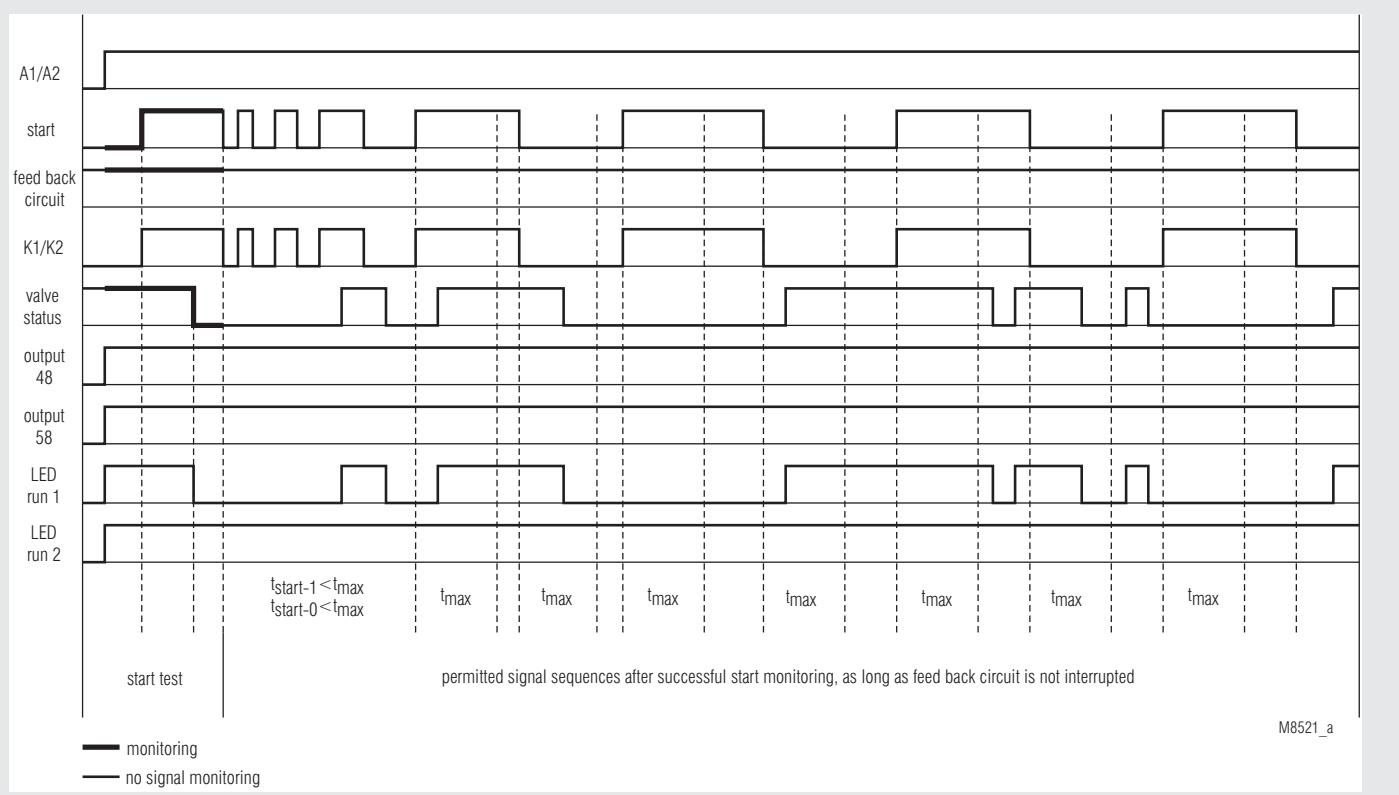

- If at the end of a machine cycle (interruption of feed back circuit or, when continuous monitoring, negative edge of the starting signal) the valve does not go back into initial position.
- If the signal on S41-S42 does not correspond after max. 100 ms to the state of the relays, when reinforcement of the contacts is selected.

## Technical Data

### EMC

Electrostatic discharge:	8 kV (contact) (Test degree 3)	IEC/EN 61 000-4-2
HF-irradiation:	10 V / m	IEC/EN 61 000-4-3
Fast transients: on wires for supply A1-A2:	2 kV	IEC/EN 61 000-4-4
on signal and control wires:	2 kV	IEC/EN 61 000-4-4
Surge voltages between wires for supply:	1 kV	IEC/EN 61 000-4-5
between wire and ground:	2 kV	IEC/EN 61 000-4-5
HF-wire guided:	10 V	IEC/EN 61 000-4-6
Interference suppression:	Limit value class B	EN 55 011

### Degree of protection

Housing:	IP 40	IEC/EN 60 529
Terminals:	IP 20	IEC/EN 60 529

**Housing:** Thermoplastic with V0-behaviour

**Vibration resistance:** to UL subject 94  
according to IEC/EN 61 496-1 (1997)  
Amplitude 0.35 mm IEC/EN 60 068-2-6  
Frequency 10 ... 55 Hz

### Shock resistance:

Acceleration: 10 g  
Impulse length: 16 ms

Number of shocks: 1000 per axis on all three axes

**Climate resistance:** 0 / 050 / 04 IEC/EN 60 068-1

**Terminal designation:** EN 50 005

**Wire connection:** 1 x 2.5 mm<sup>2</sup> stranded wire with sleeve  
or  
1 x 4 mm<sup>2</sup> massive or  
2 x 1.5 mm<sup>2</sup> stranded wire with sleeve  
DIN 46 228-1/-2/-3/-4

**Wire fixing:** Box terminals with self lifting wire

Protection and plus-minus screws M3.5

**Mounting:** DIN rail IEC/EN 60 715  
**Weight:** 320 g

### Dimensions

**Width x height x depth:** 45 x 84 x 121 mm

## Safety Related Data

### Values according to EN ISO 13849-1:

Kategorie:	4
PL:	e
MTTF <sub>d</sub> :	31.9
DC / DC <sub>avg</sub> :	98,9 %
d <sub>op</sub> :	220 d/a (days/year)
h <sub>op</sub> :	12 h/d (hours/day)
t <sub>Zyklus</sub> :	97 s/Zyklus

### Values according to IEC/EN 62061 / IEC/EN 61508:

SIL CL:	3	IEC/EN 62061
SIL	3	IEC/EN 61508
HFT:	1	
DC / DC <sub>avg</sub> :	98.9 %	
SFF	99.6 %	
PFH <sub>D</sub> :	7.66E-9 h <sup>-1</sup>	

<sup>1)</sup> HFT = Hardware-Failure-Tolerance

The values stated above are valid for the standard type.

Safety data for other variants are available on request.

The safety relevant data of the complete system has to be determined by the manufacturer of the system.

## UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL 508, "general use applications"

**Nominal voltage U<sub>N</sub>:** DC 24 V

**Ambient temperature:** 0 ... +50°C

### Switching capacity:

Ambient temperature 50°C: Pilot duty B300  
5A 250Vac G.P.  
5A 24Vdc  
Semiconductor outputs: 24Vdc, 100 mA

**Wire connection:** 60°C / 75°C copper conductors only  
AWG 20 - 12 Sol Torque 0.8 Nm  
AWG 20 - 14 Str Torque 0.8 Nm

Technical data that is not stated in the UL-Data, can be found in the technical data section.

## Standard Type

BH 5904.02/00MF2 DC 24 V

## Fault Indication By Flashing Code

The failure codes are displayed by a flashing sequence of the upper yellow LEDs run 1, run 2. Flashing frequency: env. 0,5 s on, 0,05 s off, end of the sequence: env. 2 s off. It is possible that the two processors show different failure codes.

If a failure is displayed, the relays K1 and K2 are switched off.

The module BH 5904 shows 2 types of failure codes:

### 1. FAILURE type 1:

These failures are serious and do not allow further operation of the module. They are indicated only by the LEDs run 1 and / or run 2 of the module. The semiconductor outputs 48 and 58 are both switched off. The module can only be reset by switching the power supply off and on again.

### 2. FAILURE type 2:

This failure is concerning the function faults in conjunction with the safety controller and / or the monitored valve. These faults are only indicated on LED run 1, the LED run 2 stays on. The module locks out except in the case when the feed back circuit of the controller is interrupted. It can only be reset by switching the power supply off and on again or by pressing the reset button.

### Failure type 1

No*)	Description	Mesures et conseils
0	Internal module failure (LEDs are continuously off)	If both LEDs stay off, the module is defective and has to be repaired.
5	Adjustment failure	1) The settings of the 2 channels are not identically. 2) The selected setting is not permitted.
6	Undervoltage detection ou Overvoltage detection	1) Left LED is flashing: The supply voltage dropped below the permitted value (< approx. 0.85 U <sub>N</sub> ) 2) Right LED is flashing: The supply voltage went over the permitted value (> approx. 1.15 U <sub>N</sub> + 5 % residual ripple)
7	Input failure	1) A short circuit has been detected on the inputs of the unit. 2) The 2 signals of a 2-channel feed back circuit do not correspond (shortcircuit, broken wire or other fault)
8	Failure on relays K1 or K2	Check circuit and current. Module has to be repaired.
9	Internal module failure	Please try to evaluate the circumstances that lead to this fault and check with the supplier or manufacturer.
10		
11	Internal module failure	The module has to be repaired
12		
13	Internal module failure	The module has to be repaired
14		

\*) No.: Number of flash pulses in a series

### Failure type 2

No.*)	Description	Measures and notes
1	Valve starting failure (no end position)	The valve has not reached its end position within the adjusted time. The unit has locked out.
2	Setting failure	The valve is not in initial position when starting or has not reached the initial position after de-activation within the adjusted time. The unit has locked out.
3	Feed back circuit interrupted from safety controller	The unit is again ready for start as the feed back circuit is closed, the valve has returned back to initial position within the adjusted time and the starting signal is off.
4	Contact reinforcement failure	The reaction time for the external relays was too long. The unit has locked out.
5	PLC-starting failure	Start is active, while it should be inactive.
6	Failure on reset button	Reset button was activated while switching on or has been pressed for more than 3 s. The unit has locked out. It can be reset by releasing and pressing again the reset button or by switching the supply off and on again.

\*) No.: Number of flash pulses in a series

## Your advantages

- easy to exchange due to plug connector and profile frame mounting
- slim design, easy to mount on safety guards with only one screw in profile frame

## Features

- NI 5061.06: Emergency stop with 2 NC contacts (forced opening)  
NI 5061.43: Emergency stop with 2 NC contacts (forced opening) + 1 NO contact
- M12-connection  
NI 5061.06: 4-poles  
NI 5061.43: 8-poles
- Twist release left or right
- Foolproof acc. to EN ISO 13850
- According to EN 60947-5-1, EN 60947-5-5

## Approvals and Markings

## Application

The VARIBOX emergency-stop Minibox is a electromechanical switchgear serving to protect persons working with machinery or close to it. It is used to stop or switch off machinery and equipments in order to avert impending or minimise existing dangers to persons or damages on machines /material.

The following (inter)national statutory provisions apply to installation, commissioning and regular technical inspections:

- Directive 2006/42/EG
- Low-Voltage Directive 2006/95/EG
- Safety Regulations as well as
- Regulations of the Accident Prevention / Safety Rules

Manufacturers and operators of machines using E-stops or emergency switch-off devices should retain the responsibility for the adherence of these instructions as well as for compliance with the relevant Safety Regulations and Rules

For the application of E-stops /emergency switch-off devices as directed the respective requirements for installation and operation must be observed:

- EN60204-1:2006
- EN13849-1/-2:2008
- EN ISO 13850:2008

## Function

The VARIBOX has been designed for M12-connection. The button is actuated by pushing and reset by turning into both directions.

## Standard Type

VARIBOX Not-Halt-Gerät NI 5061.06  
Article number: 0065346

## Variant

VARIBOX Not-Halt-Gerät NI 5061.43  
8-poles; 2 NC contacts (forced opening) + 1 NO contact  
Article number: 0065694

**DANGER**

- Dangerous voltage.**  
**Electric shock will result in death or serious injury.**  
 Disconnect all power supplies before servicing equipment.

**CAUTION**

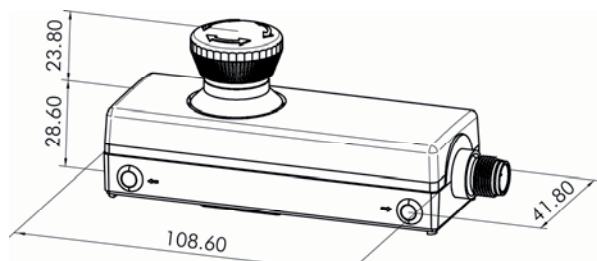

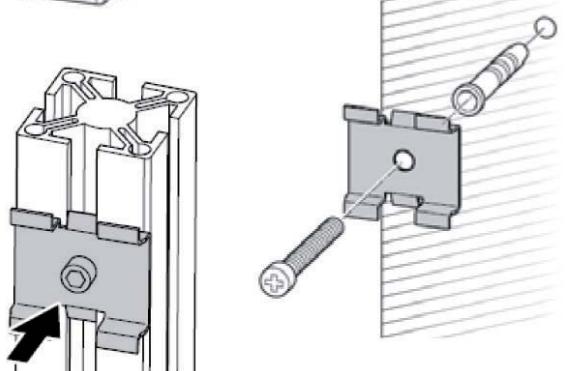

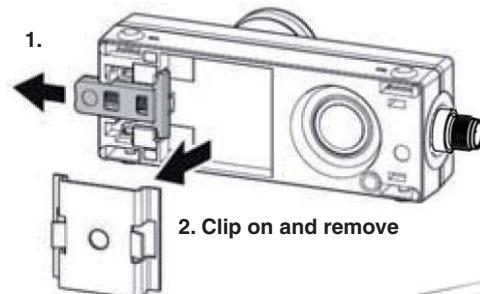

Safe operation of the device is only guaranteed when using certified components!

**Safety notes**

The product hereby described was developed to perform safety functions as a part of a whole installation or machine. A complete safety system normally includes sensors, evaluation units, signals and logical modules for safe disconnections. The manufacturer of the installation or machine is responsible for ensuring proper functioning of the whole system. DOLD cannot guarantee all the specifications of an installation or machine that was not designed by DOLD. The total concept of the control system into which the device is integrated must be validated by the user. DOLD also takes over no liability for recommendations which are given or implied in the following description. The following description implies no modification of the general DOLD terms of delivery, warranty or liability claims.

**ATTENTION**

- This device must be installed and operated by trained staff who are familiar with these instructions and with the current regulations for safety at work and accident prevention.
- Pay attention to applicable local regulations, especially regarding safety measures.
- E-stops/ emergency switch-off devices fulfil the function of personal protection. Improper installation or unauthorised modification may lead to severe personal injuries
- E-stops /emergency switch-off devices should not be bypassed, removed or otherwise disabled
- Improper installation or tampering may result in machine and material damages!
- The E-stop /emergency switch-off function should not replace the applicable safety precautions or other safety functions but should rather be used as a back-up safeguarding measure
- The E-stop /emergency switch-off function should not impair the effectiveness of other safety devices or equipment with other safety functions.
- Based on his hazard analysis the design engineer must ensure that in combination with the control system the E-stop /emergency switch-off device meets the required safety category

**Dimension [mm]**

**Assembly and Commissioning**

**Mounting on profile**
**Wall mounting**
**Testing Before First Operation**

Mechanical Test: E-stop/switch-off device latches when operated  
 Electrical Test: Machine stops / switches off

**Disassembling**

Before disassembling disconnect equipment and device from the mains!!

**Note**

A „click“ must be heard when closing the box

- Check whether the two Minibox parts are snapped together properly.
- Make sure that the E-stop is always easily accessible.

**Maintenance**

- Based on his risk assessment, the machine designer has to determine the inspection interval. It is, however, recommended that the competent safety officer activates and tests the E-stop or switch-off device at least once a year to ensure its proper functioning.
- Mechanical and electrical functional testing acc. to paragraph 4
- Secure mounting
- No visible unauthorised modifications or damages
- No loose connections

**Incident Management**

Mechanical overload or external impact damage may impair the function of the E-stop / switch-off device. Make functional tests as mentioned under „Maintenance“.

## Application

Indication of the status of e-stop buttons in an e-stop chain. We recommend to use the BH 5922 together with DOLD E-stop modules (approval).

## Function

If all the e-stop buttons are closed all green LEDs are on. If one button is activated the corresponding LED goes off.

The e-stop buttons are connected in series, therefore only one LED goes off even if several buttons are pressed. Only the first activated button in the row is indicated. When this e-stop button is released again the LED lights up again and the LED of the next activated button in the row goes off.

If the variant B\_5922/0\_2, B\_5922/0\_4, B\_5922/0\_5, B\_5922/1\_2, B\_5922/1\_4, B\_5922/1\_5 is connected to a IP 5503 in Plug and Play modus the outputs show the state of the E-stop buttons and the LEDs the state of the status LEDs I1 - I8 on the e-stop monitor.

## Indicators

Green LED "On":

on, when supply connected  
on, when ready for operation (only with

B\_5922/2\_ )

on, when bus active (only with variants

Yellow LED:  
with fieldbus)

red LED "ERR":  
on, when indicating failure (only with

B\_5922/2\_ )

Continuous:  
when all e-stop buttons are closed

Off:

when corresponding e-stop button is  
pressed

Flashing of one status LED only when:

- manual reset and
- released e-stop buttons and
- signal not reset

Reset can be made with button on front  
or with remote reset-button.

Flashing of all status LEDs:

The input S11 of the e-stop monitor is not  
connected. A reason could be a broken  
wire between this terminal and S11 of the  
e-stop module. When several e-stop  
monitors are connected in series this  
status also occurs when the previous  
shows an activated e-stop button.

## Notes

When using B\_5922/00\_ or B\_5922/01\_ for single channel monitoring  
or 2-channel connection of the e-stop chain the e-stop monitor has to be  
connected to the loop between S11 and S12 of the e-stop module. In this  
way channel AB is monitored.

In a 2-channel e-stop loop, the e-stop monitor has to be connected to the  
channel which normally is between the terminals S11 and S12 of the e-stop  
module. The E-stop monitor and the e-stop module have to be connected  
to the same DC 24 V power supply. When using an E-stop module with  
AC-supply the minus-terminal of the e-stop monitor (A2) must be connected  
to the minus-terminal of the e-stop control voltage (S21 or PE) on the  
e-stop module.

## Se-up Procedure

### CANopen mode (B\_5922 /0..., B\_5922/1...)

With switch position "CANopen" the CANopen protocol is active on the interface. The configuration is made with the programming software PN 5501 in conjunction with minimaster IL 5504 / IN 5504 or e.g. with ProCANopen. The corresponding configuration file on CD can be ordered under order no. PN 5501, article no. 0052860

### Plug and Play mode (B\_5922 /0..., B\_5922/1...)

With switch position "Plug and Play" a variant of the CANopen protocol is active on the interface. The unit setting is done with a switch on the front, see picture below. If a system is on plug and play mode it can be switched over to CANopen protocol at any time.

### Address setting Plug and Play mode

To allow the E-stop monitor to communicate with a corresponding device via the CAN-bus the addresses have to be set with the 2 rotational switches on the front according to the table below. Addresses between 1...49, 51...99 are possible. Address 0 and 50 cannot be chosen in Plug and Play mode.

E-stop monitor BH/BL 5922 with address	transmits to	output module IP 5503 with address
1	→	51
.	.	.
49	→	99

Example of setting:  
left switch 10<sup>1</sup>:  
right switch 10<sup>0</sup>:

Address 14  
to position 1 x 10<sup>1</sup>  
to position 4 x 10<sup>0</sup>

### Notes for Plug and Play mode

On the BL-models with 2-channel monitoring of the e-stop loop 2 addressees and 2 transmission rates can be chosen (channel AB and channel CD). For correct operation the address settings must be different and the transmission rate settings must be the same.

The screen of the bus wire has to be connected to A2 of the e-stop monitor.

### Set-up procedure

- 1.) Connect CAN-bus to terminals CAN\_L and CAN\_H
- 2.) Terminate the physical end of the bus by connecting a termination resistor of 120 Ω between CAN\_L and CAN\_H on the first and last module of the bus
- 3.) Connect screen of bus wire to A2
- 4.) Select transmission rate (e.g. 20 K bit/sec) using the rotational switch on the front (see drawing)
- 5.) Select address of the module using rotational switches on the front (see drawing and above example)

**Attention:** • To communicate in a system configured for Plug and Play modus it is necessary to connect one BH/BL 5922 with address 1 to the CAN-bus.

- The device address, the transmission rate and the change of operating mode between CANopen and Plug and Play will only be accepted when the device is powered up.

## Set-up Procedure

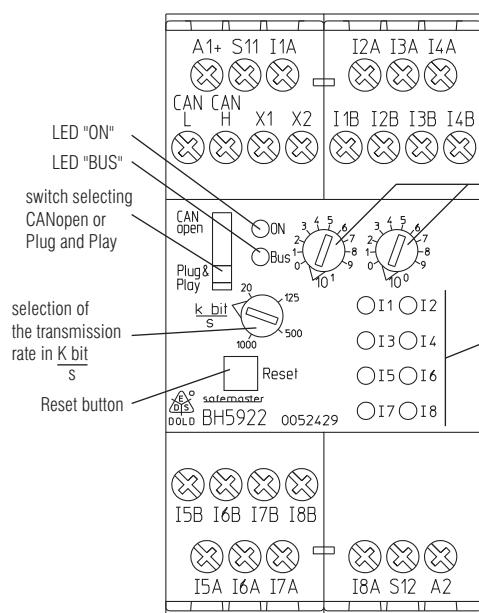

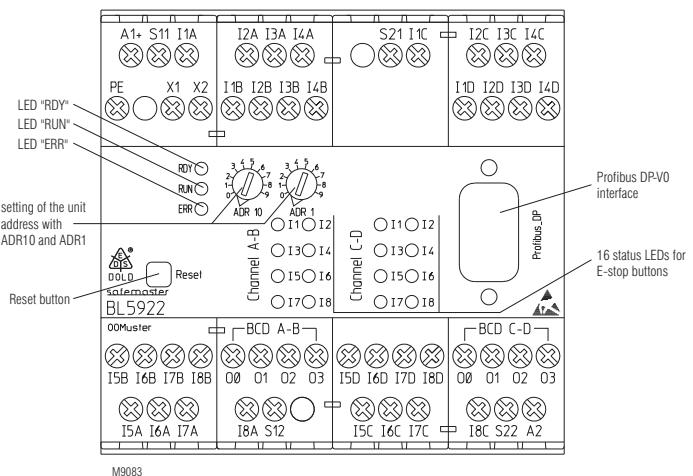

### Connection with Profibus (BL 5922 /2...)

The connection to Profibus DP is made via a Sub D connector socket on the front of the device. The standard for installation according to the PNO-document "Installation Guideline for Profibus DP/FMS" have to be observed.

### Configuration of the device

The address (01 to 99) of the module for the Profibus System is adjusted with the rotary switches ADR10 and ADR1. To configure the network the device configuration file "EDSO8E8.lsd" is necessary. It can be found on the DOLD-CD PN 5501 in the directory Profibus/GSD.

Order number: PN 5501, article number 0052860

## Description of Data Transmission for units with bus interface

### a) CANopen

The transmit PDO has follow structure:

Read8Inputs	Read8Inputs_old	Status8Inputs	Saved8Inputs	Dummy1	Dummy2	Dummy3	Device_ID
-------------	-----------------	---------------	--------------	--------	--------	--------	-----------

### b) Profibus

Kanal A - B			Kanal C - D		
Read8Inputs	Status8Inputs	Saved8Inputs	Read8Inputs	Status8Inputs	Saved8Inputs

The bytes in the data string have the following content:

Read8Inputs: State of the e-stop buttons

Bit x = 0 e-stop button

Bit x = 1 e-stop button not active

Read8Inputs\_old

(only with CANopen): State of e-stop button at time t-1. The designation of the bits is the same as with Read8Inputs

Saved8Inputs: Latched state of the e-stop buttons, if the e-stop monitor is operated in manual reset mode.

To detect that the manual reset mode is selected bit 1 in byte Status8Inputs can be used.

Status8Inputs: Actual state of e-stop monitor

Bit 0 = 1 One e-stop button is activated

Bit 1 = 1 E-stop monitor operated in manual reset mode

Bit 2 = 1 The e-stop monitor was acknowledgement (activation of reset button or remote reset)

Bit 3 = 1 At the beginning of the e-stop loop (terminal S11 or S21) the correct voltage is present. If bit 3 is 0 then the wire between e-stop modul and e-stop monitor is interrupted.

Device\_ID

(only with CANopen): Device Id = 0 x 0 C

E-stop monitor for connection of 4 e-stop buttons (.04)

Device Id = 0 X 0 D

E-stop monitor for connection of 8 e-stop buttons (.08)

Dummy 1-3

(only with CANopen): not used Bytes

Possible state of the bytes depending on the activation of the e-stop buttons:

Mode	actuation	active			not active			reset		
		E*	ST*	SP	E*	ST*	SP	E*	ST*	SP

0 = voltage on output: 0 V

1 = voltage on output: 24 V

### CANopen interface (B\_5922/0\_\_\_, B\_5922/1\_\_\_)

B\_5922/1\_\_\_: according to ISO 11 898-1,  
galvanic separation

wiring: screened twisted pair

transmission rate: settable 20 K bit/s, 125 K bit/s,

500 K bit/s, 1 M bit/s,

20 K bit/s = 2500 m

125 K bit/s = 500 m

500 K bit/s = 100 m

1 M bit/s = 25 m

### Plug and Play

transmission rate: 20 K bit / sec (recommended)

### Attention:

Both physical ends of the 2-wire system must be terminated with a 120 Ω resistor between the terminals CAN\_L and CAN\_H.

## Technical Data

### Profibus-interface (B\_5922/2\_\_)

Wire:	screened twisted pair	IEC 61 158
Protokoll:	Profibus DP-V0	
max. lengt:	1200 m at 9,6 Kbit/s ... 45,45 Kbit/s	
	1000 m at 93,75 Kbit/s ... 137,5 Kbit/s	
	400 m at 500 Kbit/s	
	200 m at 1500 Kbit/s	
	100 m at 3000 Kbit/s ... 1200 Kbit/s	

The installation guidelines according to the PNO-document "Installation Guideline for the Profibus DP/FMS" have to be observed in respect to the max. length of a bus segment. The PE terminal has to be connected to ground.

## Input

**Nominal voltage  $U_N$  (A1/A2):** DC 24 V

**Voltage range:** 0,8 ... 1,1  $U_N$

**Control voltage on S11/S12:** DC 24 V

**Reset input X<sub>1</sub>, X<sub>2</sub>:** Voltfree contact

**BCD interface:**

Output (O0,O1,O2, O3): Transistor switching +

switched /auxiliary voltage: DC 24 V

Switching capacity: 40 mA short circuit proof

Residual voltage: typ. 0,6 V

## General Data

**Operating mode:** Continuous operation

**Temperature range:** - 20 ... + 60 °C

### EMC

Electrostatic discharge: 8 kV (air) IEC/EN 61 000-4-2

Surge proof against wire bound surges, induced by high frequency fields: 10 V class 3, f = 150 kHz - 80 MHz IEC/EN 61 000-4-6

Fast transients: 2 kV IEC/EN 61 000-4-4

Surge voltages between wires for power supply: 1 kV IEC/EN 61 000-4-5

between wire and ground: 2 kV IEC/EN 61 000-4-5

Interference suppression: Limit value class B EN 55 011

### Degree of protection

Housing: IP 40 IEC/EN 60 529

Terminals: IP 20 IEC/EN 60 529

**Housing:** Thermoplastic with V0-behaviour

to UL subject 94

**Vibration resistance:** Amplitude 0,35 mm IEC/EN 60 068-2-6 frequency 10 ... 55 Hz

**Climate resistance:** 20 / 060 / 04 IEC/EN 60 068-1  
EN 50 005

Wire connection: 1 x 4 mm<sup>2</sup> solid or

1 x 2,5 mm<sup>2</sup> stranded ferruled or

2 x 1,5 mm<sup>2</sup> stranded ferruled

DIN 46 228-1/-2/-3/-4 or

2 x 2,5 mm<sup>2</sup> stranded ferruled

DIN 46 228-1/-2/-3

Wire fixing: Terminal screws M3.5, box terminals with wire protection

**Mounting:** DIN rail IEC/EN 60 715

**Weight:** approx. 255 g (BH 5922);

approx. 470 g (BL 5922)

## Dimensions

## Application Examples

Pic 8: Monitoring of 8 e-stop buttons with e-stop monitor, 2-channel connection, 2-channel monitoring cross fault monitoring with CANopen minimaster IL 5504, IN 5504

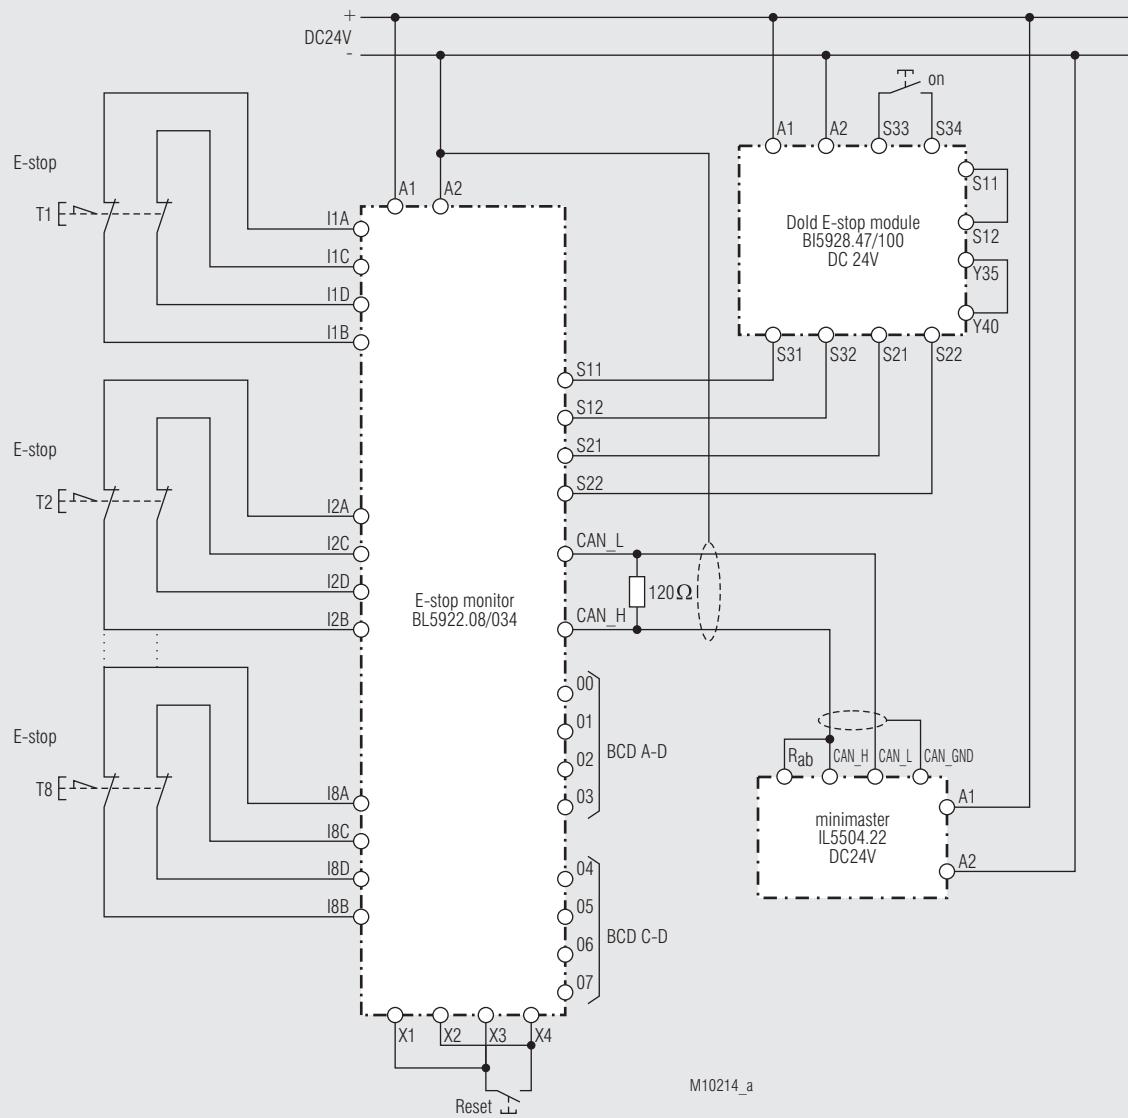

Pic 9: Monitoring of 8 e-stop buttons with e-stop monitor, 2-channel connection, 2-channel monitoring cross fault monitoring with Profibus DP-PLC

## Application Example

Pic 10: Monitoring of 16 e-stop buttons with e-stop monitor, single-channel connection, e-stop-module 2-channel, cross fault monitoring. BCD-output for remote display of the status of the e-stop buttons.

## Application Example

Pic 11: Monitoring of 8 e-stop buttons, dual channel connection, in conjunction with BI5928 2-channel with crossfault monitoring.  
 An application corresponding to above wiring diagram has performance level (PL) e according to DIN EN ISO 13849-1.  
 When more than one e-stop button is used in series the wiring of the e-stop loop must be done failsafe or the individual e-stop buttons have to be tested regularly.

# Safety Technique

## Accessories for Safety Applications Magnetic Switch coded NE 5021

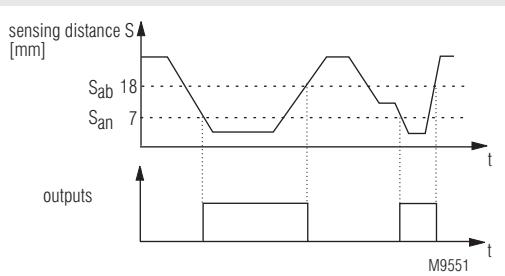

**DOLD** 

0239133

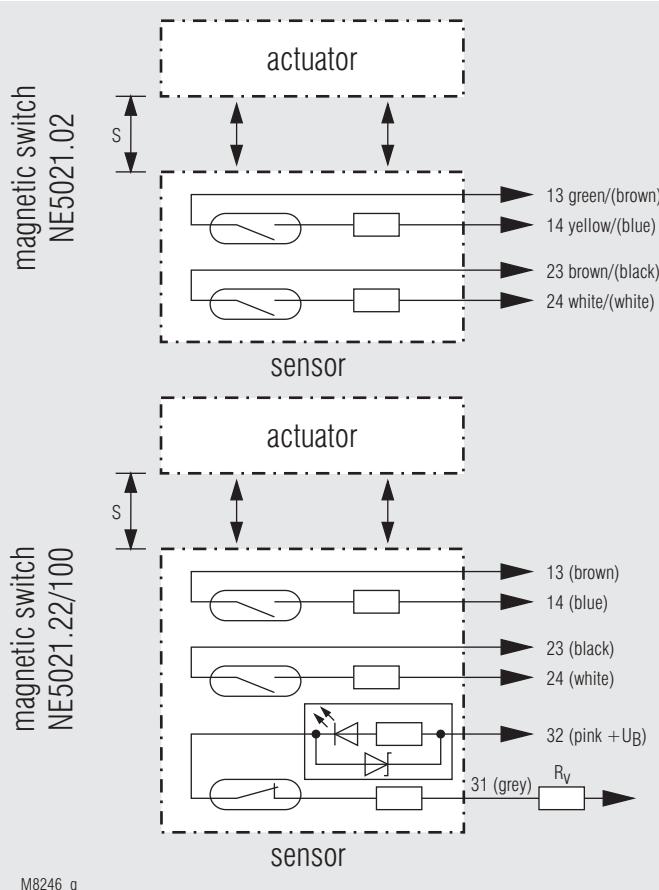

- Usable for safety application by using a correctly installed and connected, security module (e. g. BG 5925/920 or LG 5925/920)
- According to IEC/EN 60 204-1
- Standard switching distance:  $S_{ar} \leq 7 \text{ mm}$   
 $S_{ab} \geq 18 \text{ mm}$
- Max. number of switches in series:
  - 6 NE 5021 on control unit BG 5925/920 or LG 5925/920
  - 10 NE 5021 on multifunctional safety timer UG 6960 and UG 6961
  - 10 NE 5021 on multifunctional safety module UG 6980
  - 20 NE 5021 on multifunctional safety module UG 6970
  - 20 NE 5021 on multifunction module BH 5910
- 2 NO contacts or 2 NO contacts / 1 NC contact
- Contacts protected against welding
- Very long service life
- Easy to mount and service
- Manipulation is difficult due to coded sensor
- Protection class IP 67

### Function Diagram

### Block Diagram

### Additional information to this subject

- Data sheet control unit BG 5925/920 or LG 5925/920 for safety switch

### Approvals and Markings

### Application

The magnetic switch NE 5021 is suitable to detect the closed state of safety gates, sliding gates and removable covers also under rough ambient conditions or for special hygienic requirements. The magnetic switch can also be used at sluggish or inaccurate positioned doors.

- To be used with:
- BG 5925/920 or LG 5925/920 control unit.  
Max. 6 NE 5021 and 1 E-stop button in series can be connected
  - UG 6960 and UG 6961 multifunctional safety timer.  
Max. 10 NE 5021 and 1 E-stop button in series can be connected
  - UG 6980 multifunctional safety module.  
Max. 10 NE 5021 and 1 E-stop button in series can be connected
  - UG 6970 multifunctional safety module.  
Max. 10 NE 5021 for each safety function and 1 E-stop button can be connected
  - BH 5910 multifunction safety relay.  
Max. 2 x 10 NE 5021 and 1 E-stop button can be connected

## Function

The magnetic switch consists of a transmitter and a receiver. The transmitter is magnetic coded. The contacts of the receiver switch when it detects the coding of the transmitter.

Manipulation with a standard magnet will not make the contact switching. The contacts are protected against short circuit currents by series resistors, so they cannot weld.

## Indication

red LED: on, when NC contact not activated at NE 5021.22/100.

## Connections

The NE 5021 magnetic switch has to be connected according to the application examples below.

## Connection Designation

Connection	Signal description
13, 14, 23, 24	Output NO
31	Output NC Connection for DC 24 V
32	Output NC Connection for $R_V$

## Technical Data

### Switching distances

#### Safe switching distances without mounting difference

$S_{an}$ :

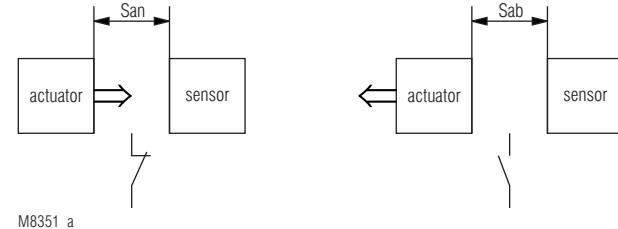

$S_{ab}$ :

undefined situation:

$\leq 7 \text{ mm}$

$\geq 18 \text{ mm}$

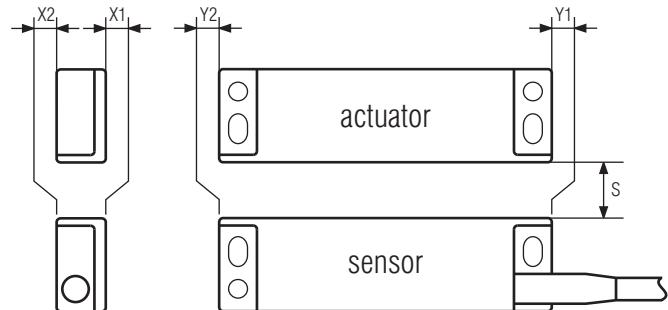

7.1 ... 17.9 mm

#### Safe switching distances with mounting difference

The switching distance  $S_{an}$  is valid for mounting method A and B when the switch is mounted on non ferromagnetic material. The min. distance between transmitter and receiver should be 3 mm. The receiver must not be used as mechanical stop for the transmitter.

#### Mounting Difference / Switching Distance $S_{an}$ Mounting Method A

## Standard Type

NE 5021.02

Article number: 0054695 (for Transmitter and Receiver)

• Output: 2 NO contacts

• Connection cable: 5 m

### Variant

NE 5021.22/100: External series resistor R<sub>V</sub> is necessary in series to NC contact

The connector 32 (pink) is designed for + U<sub>B</sub>. The connector 31 (grey) has to be connected via a series resistor R<sub>V</sub>.

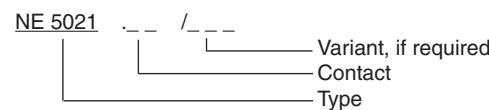

R<sub>V</sub> is depending on the connected voltage.

R<sub>V</sub> is calculated as follows:

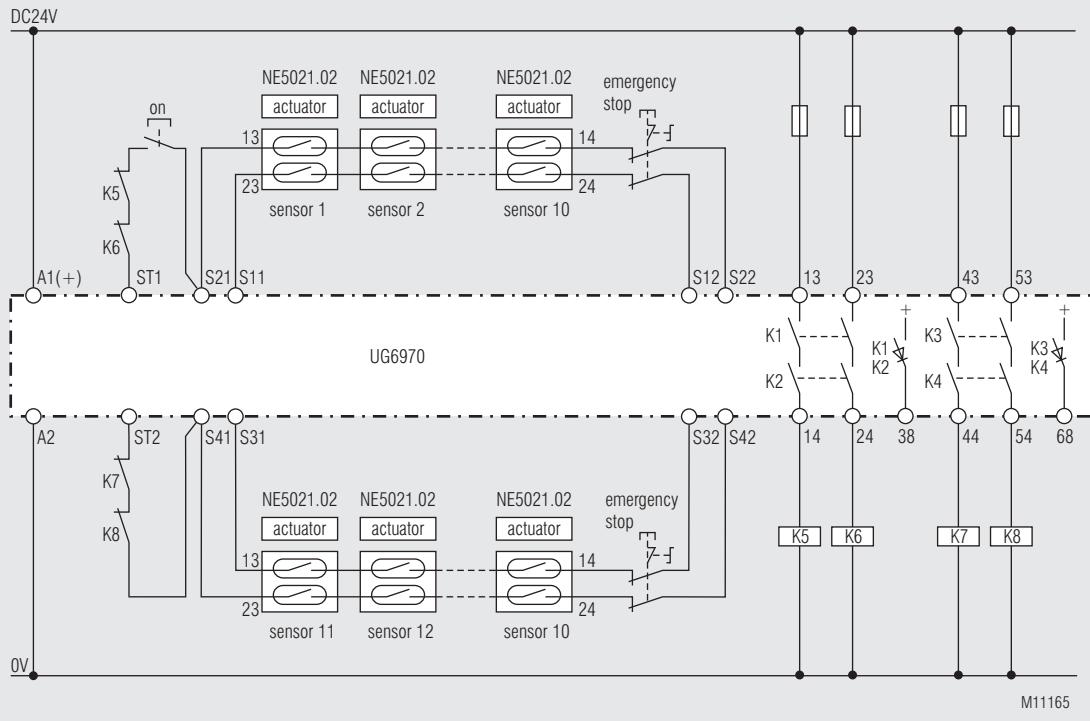

$$R_V = \frac{(U_B - 3.3) V}{I_n} \quad U_B \text{ max.} = \text{DC } 30 \text{ V}$$

I<sub>n</sub> typ. = 6 mA  
I<sub>n</sub> max. = 10 mA

## Accessories for Safety Applications Magnetic Switch coded NE 5020

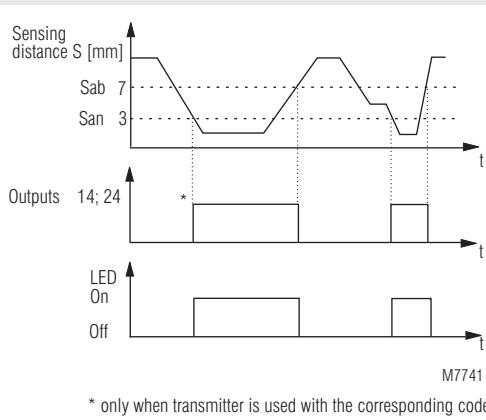

**DOLD** 

0233459

- Usable for safety application by using a correctly installed and connected, security module (e. g. BG 5925/920 or LG 5925/920)
- According to IEC/EN 60 204-1, EN 1088
- 2 channel system
- Standard switching distance:  $S_{an} \leq 5.5 \text{ mm}$   
 $S_{ab} \geq 13 \text{ mm}$
- 2 NO semiconductor outputs providing diversity and redundancy
- Magnetic coded, safe against manipulation
- Open end connection wires
- M8 or M12 connector as option
- Long service life
- Easy to mount
- Resistant against vibration
- Not sensitive to external magnetic fields
- Protection class IP 67
- LED indicator

### Function Diagram

### Approvals and Markings

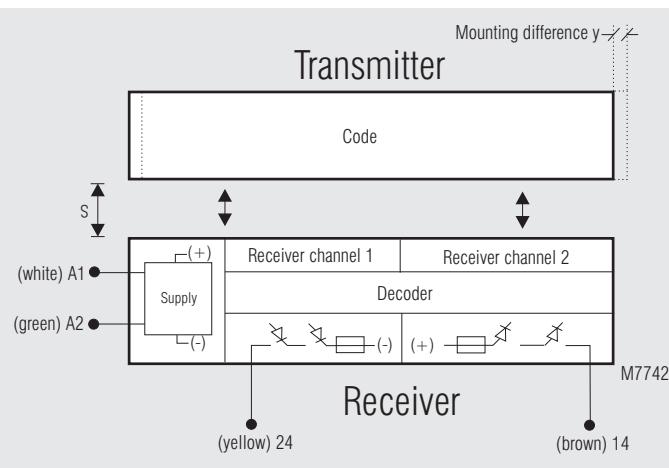

### Additional Information about this topic

- Data sheet control unit BG 5925/920 or LG 5925/920 for safety switch

### Application

The magnetic switch NE 5020 is suitable to detect the closed state of safety gates, sliding gates and removable covers also under rough ambient conditions or for hygienic requirements. The corresponding control unit is BG 5925/920 or LG 5925/920.

### Block Diagram

Drawing shows contacts in inactive state

### Function

The magnetic switch NE 5020 includes a magnetic coded transmitter and a receiver as decoder. The semiconductor outputs close, when the receiver recognises the right code from the transmitter. The control unit detects cross faults on the lines 14 and 24. The control unit is switched off when a fault is detected and inhibits a new start. The switch is protected against short circuits and peak voltages.

### Connections

The NE 5020 is connected to the control unit BG 5925/920 or LG 5925/920 according to the application example below.

### Indication

green LED: switch is active, outputs switched on

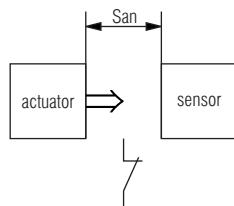

### Notes

The code of transmitter and receiver are identically on delivery. This can be verified by a mark on the test sticker.

## Technical Data

### Input

<b>Nominal voltage A1/A2 U<sub>N</sub>:</b>	DC 24 V

## SAFEMASTER PRO Configurable Safety System System Overview

0266171

### Short Description

SAFEMASTER PRO is a configurable, modular safety system consisting of a controller and 0-14 extension modules. To optimise the system according to the application input modules, output modules and combination input/output modules are available. These can be used in various combination with max. 4 units of the same type. In addition diagnostic modules allow to connect the system to a fieldbus. The communication between the modules is done via a 5 pole bus in the DIN rail (DOLD IN-RAIL-BUS). To extend the system, the extension modules are just clipped on the DIN rail.

In addition to the mentioned components relay extension modules UG 6912.14 and UG 6912.28 are available with 1 or 2 safety related relay outputs to extend the OSSDs with voltfree contacts. These extension modules are wired to the OSSDs of the output modules (take care of the total current).

### Applications

With larger installations and more complex solutions the number of safety related functions is increasing. Also often logic interconnections, e. g. to connect or disconnect parts of a larger system are required. The modular configurable safety system SAFEMASTER PRO monitors all safety related parts of a machine or plant, simple, flexible and safe.

### Additional Information about this topic

- Information about the single modules of the SAFEMASTER PRO series (see „System Components“) can be found in the User Manual.
- Information about the fieldbus modules of the SAFEMASTER PRO series (see „System Components“) can be found in the User Manual Fieldbus modules.

- Configurable, modular safety system with field bus

### Advantages of SAFEMASTER PRO

- For safety applications to PLe / cat. 4 and SIL 3
- Less wiring because of configuration software SAFEMASTER PRO Designer
- Easy planning because of Drag & Drop via graphic configuration software
- Safe speed monitoring
- Time and cost saving installation
- Reduced wiring and space saving in cabinets
- Flexible extension with safety input and output modules
- Easy extendable via BUS-Rail
- Comprehensive fault localisation and diagnostic
- Memory card as option for simple maintenance
- Coded connecting blocks for non-interchangeable connection increase assembly reliability.
- Compact design: Base- and extension modules with only 22.5 mm width

### Features

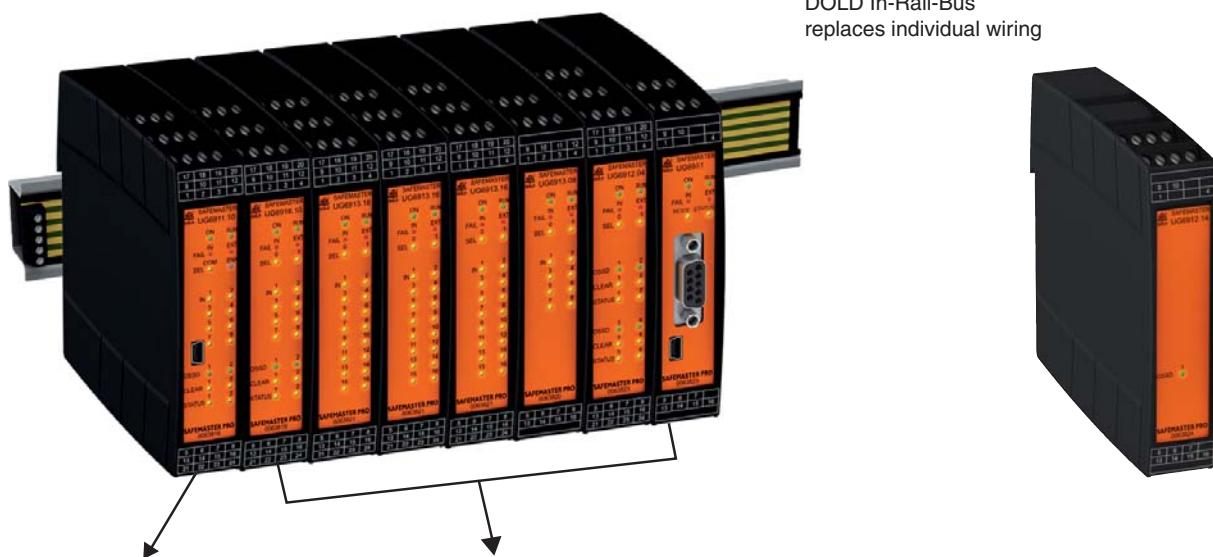

- Monitoring of opto electronical sensors, light curtains, magnetic actuated sensors, E-stop buttons, safety mats, mechanical switches, two-hand control
- up to 128 safety, single-channel inputs, dual-channel connection in pairs
- up to 16 separate safety, dual-channel outputs (OSSD),
- up to 32 separate test outputs for sensor monitoring
- 1 Feedback circuit each für every safety output with individual configurable reset
- Configuration by PC via Mini USB Port
- Using of control unit UG 6911 as stand alone unit possible
- Flexible safety logic to create and amend the safety functions
- Safe integrated logic testing
- Communication of the modules via 5 pole DIN-rail bus at the back of the units (In-Rail Bus)
- Indicator outputs, status-LEDs and bus connection via field bus modules for comprehensive diagnostics
- With pluggable terminal block for easy exchange of device

### Approvals and Markings

\*) see separate datasheet

## The System Mounting

Control Unit  
UG 6911.10

8 safety inputs and  
2 safety dual-channel  
OSSD outputs

Up to 14 extension module, possible:

- Input /Output module UG 6916.10
- Input module UG 6913.08, UG 6913.12 and UG 6913.16
- Output module OSSD UG 6912.02 and UG 6912.04
- Field bus modules for diagnostic-connetcion on field bus systems  
UG 6951 (CANopen), UG 6952 (PROFIBUS DP),  
UG 6954 (PROFINET), UG 6955 (Ethernet/IP), UG 6956 (EtherCAT),  
UG 6957 (USB)
- Output module relay UG 6914.04
- Speed monitor module UG 6917
- Bus extender module UG 6918
- with up to 128 inputs and 16 safety dual-channel outputs

Output Module Relay with 1 e.g.

2 safety relay outputs for volt free contact  
multiplication of the OSSDs  
UG 6912.14 and UG 6912.28

## The Control Unit

The UG 6911.10 can be used as stand alone safety monitor without extensions or as control unit for the flexible system SAFEMASTER PRO. The highly integrated flexibility allows nearly any combination between control unit and extension modules. Up to 72 safety inputs and 8 safety outputs (OSSD) are available. Fieldbus modules as option offer extensive diagnostic functions and simple integration to the conventional control.

## The Input Modules

If the 8 inputs of the control unit are not sufficient an extension with input modules of 8, 12 or 16 inputs can be made. as alternative to only input modules a module with 8 inputs and 2 OSSD outputs is available. Depending on the input configuration all sorts of safety actuators can be connected. These could be optoelectronic safety scanners, light curtains, magnetic coded sensors, e-stop buttons, safety mats, mechanical switches, 2-hand controls etc.

## The Output Modules OSSD

To extend the 2 safety outputs of the controller output modules with 2 or 4 dual channel semiconductor outputs are available. Also the combination input/output module with 8 safety inputs and 2 OSSD outputs can extend the number of outputs. The output modules also provide a feed back circuit input per safety output. This allows to monitor external contacts e.g. of relay modules UG 6912.14 or UG 6912.28.

## The Output Modules Relay

For simple realization of relay outputs and for potential-free contact multiplication of the OSSDs, output module relays UG 6912.14 and UG 6912.28 are available. These optionally provide 1 or 2 relay outputs, each with 2 safety-related NO contacts and one NC contact as an indicator output.

The inputs of the output module relays are wired to the OSSDs of SAFEMASTER PRO. In order to monitor the relay contacts, these are bridged across into the feedback circuits of the relevant OSSD output module.

If more relay outputs are needed, output module relays UG 6914.04 are available. These have 4 independent safe relay outputs, each of which has an NO contact. Each of the 4 safety relays is also equipped with an input for the external feedback contacts (EDM). Depending on the version, up to 8 programmable non-safe semiconductor outputs can also be used for status indication.

## The bus extender module

The UG 6918 is an extension module with which a SAFEMASTER PRO system consisting of the UG 6911.10 control unit and its extension modules, can be divided up into several module groups over longer distances (up to 50m between 2 groups).

The individual groups are each connected via 2 UG 6918 bus extender modules and a shielded cable (with 4 twisted-pair lines). Each bus extender module has 2 independent connecting channels Ch1 and Ch2.  
2 bus extender modules are connected using either of these 2 channels.

## The bus extender module

The UG 6918 is an extension module with which a SAFEMASTER PRO system consisting of the UG 6911.10 control unit and its extension modules, can be divided up into several module groups over longer distances (up to 50m between 2 groups).

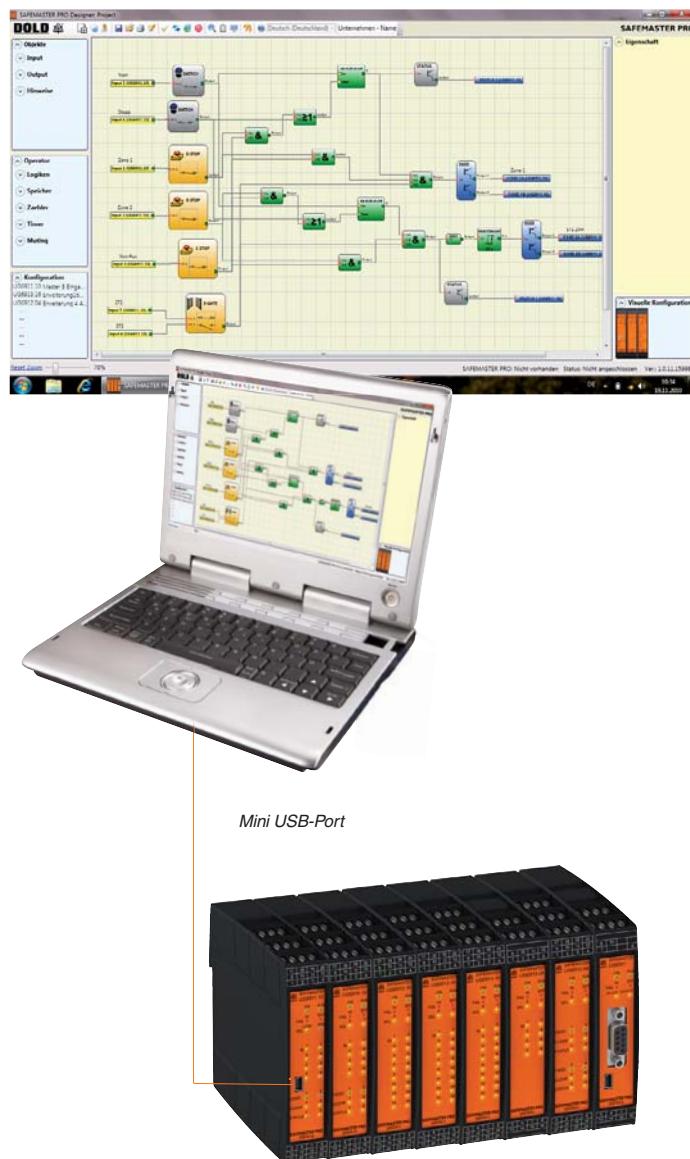

The individual groups are each connected via 2 UG 6918 bus extender modules and a shielded cable (with 4 twisted-pair lines). Each bus extender module has 2 independent connecting channels Ch1 and Ch2.  
2 bus extender modules are connected using either of these 2 channels.

## The Diagnostic Modules

3 different field bus modules for diagnostic-connetcion on field bus systems are available: UG 6951 (CANopen), UG 6952 (PROFIBUS DP), UG 6954 (PROFINET), UG 6955 (Ethernet/IP) and UG 6956 (EtherCAT). The connection between the modules is done by snapping the units on the DIN rail bus of SAFEMASTER PRO.

## System Configuration

The configuration of the TUEV approved system is done very simple on a PC with the free configuration software SAFEMASTER PRO Designer. Using complex logic circuits can be designed with logic operators and safety functions like muting, timer, counter etc. This is handled by a simple graphic configuration tool. The configuration designed on the PC is transferred via USB connection to the control unit UG 6911. Using the optional memory card OA 6911 (accessory) easy transfer of the configuration to a replacement unit is possible.

### Simple configuration in only 3 steps:

- 1 Select and configure safety functions
- 2 Assign in- and outputs and connect them  
comfortably on the PC
- 3 Test safety logic and transfer it via USB cable  
to the safety module - ready!

## Safety Related Data

### Values according to EN ISO 13849-1:

Category:	4
PL:	e
MTTF <sub>d</sub> :	30 ... 100
DC <sub>avg</sub> :	high
Service life:	20 a (year)

### Values according to IEC EN 62061 / IEC EN 61508:

SIL CL:	3	IEC EN 62061
SIL:	3	IEC EN 61508
DC <sub>avg</sub> :	high	
PFH <sub>D</sub> :	10 <sup>-8</sup> ... 10 <sup>-7</sup>	h <sup>-1</sup>

### UL-Data

The safety functions were not evaluated by UL. Listing is accomplished according to requirements of Standard UL 508, "general use applications"

**Nominal voltage U<sub>N</sub>:** DC 24 V  
± 20 % / current supply class II or voltage and current limits.

**Nominal consumption:** max. 3 W

**Switching capacity:**  
OSSD semiconductor outputs: 24Vdc, 400mA  
OSSD relay output: 6A 250Vac, resistive  
Status output: 24Vdc, 100 mA

**Wire connection:** 60°C / 75°C copper conductors only  
0,5 ... 2,5 mm<sup>2</sup>  
AWG 12 - 30 Sol/Str Torque 5-7 lb-in

**Note:** For use in pollution degree 2 overvoltage category II environment only

**Info** Technical data that is not stated in the UL-Data, can be found in the technical data section.

## General Technical Data

Inputs max.	128		
OSSD-outputs max.	16 2-channel-outputs		
Indicator output max.	16		
Extension modules max. (not UG 6912.14 - UG 6912.28)	14		
Extension modules of the same type (not UG 6912.14 - UG 6912.28)	4
